could not refuse to answer them, for he had promised to resume relations with the Irish party so soon as it had replaced Parnell by a new leader, and he saw that as Parnell's strategy was to accuse them in Ireland of placing blind confidence in their English allies, it was only fair they should have something specific to say. However, he judged it wiser to give no opening to misunderstandings by oral interviews, and accordingly formulated his views on the provisions of a proper scheme of home rule in two short memoranda bearing on the questions of the control of the Irish police and the powers of an Irish Legislature over the land question. These have already been published. The views therein expressed did not go beyond what was implied in the bill of 1886, nor beyond what nine-tenths of the English Liberal party hold to be needful. They are indeed absolutely prescribed by the circumstances and conditions of the case. To the Irish majority, and, it would seem, though the facts are not yet quite clear, to Messrs. Dillon and O'Brien also, Mr. Gladstone's replies seemed satisfactory. But Mr. Parnell, finding it difficult to protract the negotiation further, and (as report says) in a moment of irritation, declared himself dissatisfied, and required the Irish majority to insist upon a further condition regarding the police. They, thinking such a condition needless and the demand for it a mere pretext to avoid the fulfilment of his promised retirement, refused to press Mr. Gladstone further; he insisted, the negotiations collapsed, and, as you know, the two exiles forthwith surrendered and were lodged in Clonmel Jail. Knowing that they would have no opportunity for six months to come of defending their position against any attacks that might be made upon them, or of denying any misconstructions that might be put upon their words, Messrs. Dillon and O'Brien, in their respective manifestoes, wisely confined themselves to expressions of regret that the attempted *modus vivendi* had failed. But it is pretty well known, and will doubtless have been made known in America before these lines reach you, what their sentiments, and especially Mr. Dillon's, are.

What is the upshot of the whole affair? How far has it altered the relative position of the two Irish sections and affected Mr. Parnell's future? Very little. The position is much the same to-day as it was the day after the Kilkenny election showed that in the rural districts of Ireland Mr. Parnell is weaker than his antagonists. The Irish majority has kept its ranks closed; the bishops have repeated their declaration against the co-respondent of the divorce-court action. On the other hand, no prominent Parnellite has renounced the deposed leader, though several are believed to remain reluctantly in his camp. Neither has anything novel been elicited regarding the plans of the English Liberal party. Mr. Gladstone's utterances on the questions of police control and land legislation are exactly what every one would have predicted. All that has happened is that two months have been spent in parleyings which have shown the dispassionate observer that there is no principle involved in the Irish schism, nor anything to be settled, except the purely personal question whether Mr. Parnell shall still lead the Nationalist party. It is fair to say that neither party shows signs of exasperation. The lapse of time has softened such hostility as existed in December, nor is there any likelihood that it will again become acute. The interest of both sections is to avoid collisions in the House of Commons, where every sharp word would give occasion for merriment and mockery to their common foes. Even in Ireland it is doubtful whether either section will gain anything by attacking the other. If seats should become vacant, there may be contests like that of Kilkenny, but in most cases it will be possible to predict beforehand whether a Parnellite or anti-Parnellite candidate has the best chance. Those who know Ireland declare that in the rural districts the influence of the clergy is supreme, and that Parnell's nominees would succeed only in Dublin, Limerick, and one or two other towns. It is far from certain whether he could hold Cork city.

A more important question is how the schism, if it continues up till the next general election, will affect the results of that election in Ireland and in Great Britain. As regards Ireland, everything will depend on whether Mr. Parnell and his opponents can arrange some sort of compromise which will not divide their voting strength in the constituencies where the Nationalist party is least safe. If they can, the next election will show few changes. A seat or two may be won by the Tories in Ulster, a seat or two lost, but the general result will be unaffected. But should Parnellite and anti-Parnellite candidates oppose one another, their division may in eight or nine constituencies let in a Tory. This would be a serious blow, for the Home-Rule party have been accustomed in argument to rely very much on the fact that 86 out of the 103 members from Ireland are Nationalists, and that even in Ulster the Nationalists have a member more than their opponents. The danger is so obvious that if it is incurred, it will be because passion has overcome policy in the breasts of the rival Irish parties. That Mr. Parnell will abandon his pretensions to lead is improbable, for he is possessed by a sort of Napoleonic confidence in his star, a belief that he alone can lead his country to victory, and that his own cause is her cause. Neither can the majority yield. Many of them have now formed a rooted distrust of him, and any surrender to him would discredit the home-rule cause in England. If both sides are wise, they will agree not to fight with one another except where the weakness of the Tories enables them to do so with impunity.

As respects England, the most singular feature of the last three months has been the contrast between the attitude of the so-called "upper classes" and that of the rank and file in the two political parties. The former thought Mr. Parnell's disgrace and the split that followed, and the angry recriminations of the two Irish sections, a fatal blow to the home-rule cause. Mr. Chamberlain and most of the other leading Tories and Anti-Home-Rule Liberals declared that the battle was won: Mr. Gladstone's policy was dead, and nothing remained but for it to be buried and him to retire from the scene. This was the universal belief of the fashionable world, of the landed gentry, of the upper strata of the mercantile and professional world. It was shared by most of Mr. Gladstone's followers in these classes—classes in which, it need hardly be said, he has a very small percentage of support. On the other hand, the mass of the Liberal party seem to have remained quite unaffected by these new phases of the question. Some of them would probably have "rebelled" and refused to vote if Parnell had remained leader of the Irish forces. But when he had been deposed, they considered that the Irish party had set itself right with its English friends, and, having made up their mind against coercion and in favor of an Irish Parliament, they were not going to be diverted from their purposes and convictions by any passing incidents. This is the only adequate explanation of the election at Hartlepool, which so alarmed the Cabinet that they abandoned the idea of dissolving Parliament, and is confirmed by the greatly increased majority which the Liberals have obtained at Northampton. For the moment, therefore, the prospects of the Government, lately deemed so bright, have again been clouded, and the expectation of an early dissolution has receded. The Liberals are cheerful, and some think the chance of their getting a large majority nearly as good as it confessedly was four months ago. I doubt this, nevertheless, if Mr. Parnell and the majority led by Mr. McCarthy can be induced to adopt discreet tactics. If there is no recrudescence of Fenianism in Ireland, and Mr. Parnell's attacks on Mr. Gladstone and denunciations of England find as little echo as they have hitherto evoked, Mr. Gladstone may in less than two years from now be forming his fourth Ministry. His vigor and his willingness to undertake all sorts of political and unpolitical work seem unabated. T.

THE IRISH LIBERAL VIEW.

DUBLIN, February 18, 1891.

THE imprisonment of Dillon and William O'Brien leaves the political field more than ever free for Parnell to pose as the leader of the Irish people, and to claim the merit, as he has not scrupled to do, of the work of these two men, who have for years been in the forefront of the battle both in Ireland and in Parliament. If Parnell's motive is merely personal ambition, the temporary removal from the scene of two men, either of whom, if free, would have had as much personal influence with the Irish people as himself, must seem to him and his adherents a distinct gain. A comparison of his and their political records is distinctly unfavorable to Parnell. For several years he has remained in a condition of political apathy, in mysterious seclusion, rarely appearing in the House of Commons, never in Ireland. On many critical occasions, when counsel was wanted and command would have been welcomed, he was not to be found; even his address was unknown. As the formal medium of communication with the Liberal leaders, he concealed from his most influential followers the terms proposed by them and accepted by him, and is convicted out of his own mouth by his speeches subsequent to these negotiations, both in 1886 and in 1890, and by his recent manifesto, of having been ready to agree to a home-rule scheme which he must have known would be distasteful to his followers and to the Irish Nationalists, and which admittedly was insufficient to set the Irish question at rest, or remove the Irish difficulty from the field of imperial politics.

During this period Dillon and O'Brien have been unceasingly engaged, in Parliament and in Ireland, in conducting the affairs of the party with wisdom and courage. Both of them have won a high place in the esteem of all who know them either as political opponents or as friends. It is indicative of Dillon's chivalric nature that the occasion for which he is now in prison, and that for which he underwent a previous term, were both cases in which he was not the originator of the local agitation. He had advised a more prudent course in one case, and had not been consulted in the other; but when appealed to by the farmers in difficulty and almost on the verge of defeat, he threw himself unhesitatingly into the struggle.

Even supposing that Parnell remains for the present the dominant personality in the Irish

movement, the schism in the hitherto solid ranks seems to me far from being the great evil it is represented to be. The organization was resting on a very insecure foundation—an informal, unacknowledged, but practical dictatorship. Elected year after year as Chairman of the Parliamentary party, Parnell, for the last four or five years, has neither led the party nor consulted with them except upon rare occasions. Absent on many a critical occasion, he has unexpectedly put in an appearance on others, and taken his followers aback by his action and speeches, notably when he supported the Conservatives in the grant of a dowry from the nation to the daughter of the Prince of Wales, and by a startling and novel proposal on the Land Question, sprung without notice on his colleagues and the Liberal leaders in the midst of an important debate. His influence alone induced the Irish members to accept, though with some reservations, and with apologies to their constituents, Gladstone's very inadequate home-rule proposal in 1886; and he had apparently led Gladstone to believe that his followers would agree to the still more unsatisfactory proposals discussed at Hawarden in 1890.

The dissatisfaction with his leadership evinced by the present schism is due to long latent discontent, not merely to the result of the divorce case and Parnell's subsequent attitude. His demeanor in Committee Room No. 15 during the debates of the Irish party, his vaporing when outvoted about being the leader of the Irish people, and his refusal to submit to the majority's decision, amounted to a claim to an absolute dictatorship.

The result of the schism is that we have now two Irish parties in Parliament, vying with each other which shall best serve the country; the extent and meaning of home rule has been defined, and a zero line has been laid down which will make a sham measure impossible of acceptance in Ireland. Reservations to the Imperial Government of police control, of appointments of judges and magistrates, of questions of local taxation, could no longer be agreed to by Irish members. Complete independence in local matters, combined with complete solidarity in imperial questions, is the only principle on which a successful home-rule measure could be passed; and the more this question of reservations is debated in public, the less will the framers of the new Irish Constitution be likely to err.

It is quite on the cards that Parnell may again be the *de facto* leader of the Parliamentary party, for the electors who now support his opponents may have to choose between him and the English Liberals, if the present Irish majority fail either through internal dissensions or for want of money. Experience has taught us that the good intentions of English Liberals have never been translated into legislation in accordance with Irish ideas except when supported by a strong Irish vote. The Irish electorate will be more disposed now to look to measures and not to men. If Parnell had led his party during the past five years in the spirit in which he has conducted his secession campaign, the defection in consequence of the divorce case would have been much smaller than it is. He has been taught a lesson which will have enduring consequences; from the recluse, the cold and unimpassioned speaker, distant in manner to his colleagues, apathetic, negligent of business—sometimes on the score of health, sometimes on the ground of constitutional wisdom—he has been transformed into the vigorous man of action, the impassioned platform orator, appealing to sentiment and patriotism, exhibiting a new-born enthusiasm and sympathy for the evicted tenants and laboring classes. Reticence as to what should constitute a home-rule bill is replaced by an elaborate detailment of his requisitions. The selfish audacity with which he has claimed credit for the work so ably done by his former lieutenants, recalls Napoleon's jealousy of other successful generals and to some extent goes down with the multitude.

The weakness of the larger wing of the Nationalist party consists in its having a few members who are English Liberals rather than Irish Nationalists; in want of money, for most of the campaign funds were under control of their adversaries; in, for the present, a lack of a newspaper to replace the *Freeman's Journal*. Many of the Irish members could not afford to live in London during the session on their own resources, and still less could afford the expense of contested elections. It remains to be seen what funds will be provided by the public for these purposes, but it is extremely probable that some of the most useful members may have to retire for financial reasons. Neither wing of the party can expect to obtain the same money support that has been given here tofore, and for the present it is supposed that what was known as the Parliamentary Fund is wholly in the hands of Parnell. The new paper, which is to be called the *National Press*, will make its appearance next month, but till then the anti-Parnellite members are practically voiceless except so far as the provincial papers, with their limited circulation, go.

Taking the situation as a whole, it seems to me that the home-rule cause is now on a better basis than before the schism. Ireland, though divided in opinion about men, remains solid as to measures, and the country is better informed, and can express an opinion on the subjects in controversy more freely, than during the hole-and-corner negotiations carried on by Parnell, who apparently resented inquiries, and kept his colleagues as well as the country in the dark as to what he was demanding and what he was prepared to agree to.

AN IRISHMAN.

POPULAR ENGLISH PAPERS.

LONDON, February 11, 1891.

THE fertility of the newspaper press in England of late years is a subject which calls for more attention than it usually receives. Americans are supposed to be the greatest newspaper readers in the world, and so, perhaps, in a certain sense, we are. We may, individually, read a greater number than people of other nationalities. But a glance at one of W. H. Smith's railway book-stalls shows that we are really far behind the English in the endless variety of little sheets published. If the character of a nation can be determined by what it reads, much useful instruction is to be had from the study of current publications meant to appeal directly to the public taste. It is therefore important to note that still more striking than the variety of English papers and periodicals is the fact that a large proportion are worse than worthless from a literary and artistic (for many are illustrated) standpoint.

We have not much to be proud of in some of our great dailies, with their Sunday editions overflowing with gossip and small talk and fashion and society news; and we have our fair share of periodicals that might be dispensed with altogether. But, at least, at our newsstands prominence is given to the better magazines and better papers, both foreign and American. In England there are the well-known morning dailies, dull and decorous, taken in by everybody, as much a matter of course as the daily supply of bread and milk; and there are the political and literary weeklies, several ably edited, with a very limited subscription list, however. But far more prominent than these are the innumerable insignificant little sheets, quite without reputation, and unheard of outside their own circle of readers—for readers they must find somewhere, or Mr. W. H. Smith, who is a cleverer man of business than leader of the House, would not offer them for sale. The most popular of these are of the *Tit-Bits* order, composed of odds and ends, stray snatches of reading, taken from the press of the whole world. Others depend upon, not their contents, but the prizes they offer, by which the true Briton's love of gambling is encouraged. Many cater to the hobby of a special class, whether it be a particular branch of sport or society gossip and scandal; for while the Englishman lavishes abuse upon the gossiping tone of our papers, he carefully reserves separate organs for his own society news, so that he may always know exactly where to find it, and be able to take it in large doses all at once. Then there are papers of the *Ally Sloper* character, alleged comic journals, but unintelligible to most men, and the cheaper illustrated papers, whose only claim to success is the trifle charged for matter that nobody ought to want. Indeed, the number of these publications would be almost incredible to any one who had not seen them spread out on the book-stalls, where they are so much more in evidence than anything else. For one *Nineteenth Century* or *Saturday Review*, there are piles of *Tit-Bits*, *Short Cuts*, *Pearsons*, *Answers*, *Funny Folks*, *Snacks*, *Scraps*, *Pelicans*, *Hawks*, to mention a few. Only a little better are gossip-mongering weeklies like *Truth* and the *World*. And these are the papers that sell. Of *Tit-Bits* alone, such a large edition is published that, I understand, it has to be printed in at least two different towns.

There is no doubt that these innumerable publications are the outcome of general and free education. A hundred or even fifty years ago, they would have been impossible, since then there would have been but too small a minority to whom such trash could have appealed. It may be thought a hopeful sign that so many people can and care to read nowadays. But the quality of the literary (?) fare provided for them makes one wish they had never as much as learned their alphabet. It may be that the people must be educated up to the standard of the class with whom for generations education has been a right; they must perhaps have to begin with simple reading; but, simple as it may be, if not good as well, they will never get beyond it. The man whose mind has been filled with *Scraps* and *Snacks* will rarely be able to digest more substantial mental food. It is, as Sir Walter Scott wrote in his Journal, when speaking of the necessity of bringing standard works within the reach of all ranks of readers: "To make boys learn to read and then place no good books within their reach, is to give men an appetite and leave nothing in the pantry save unwholesome and poisonous food, which, depend upon it, they will eat rather than starve." I have lately seen it argued that the modern fertility of the press should distress no one, since educated people are not compelled to look at every new production. But the evil done to the many who accustom themselves to reading what over here has been christened the "new journalese," and to seeing illustrations that defy

every canon of good art, is not easily calculated. Their artistic and literary sense must in the end be dulled for ever, and they will become eventually utterly incapable of appreciating good art and good literature. This is why one watches with such interest each new journalistic venture, hoping against hope that, by setting itself a higher standard, it will help to elevate the public taste to which it caters.

Last year, of the many papers added to the already enormous supply, only three were of note. These were the *Speaker*, the *Review of Reviews*, and the *Daily Graphic*. Of the *Speaker* it is useless here to say anything. It belongs to the weeklies of comparatively limited circulation, and has no influence upon the great mass of readers. As everybody has been assured again and again, the success of the *Review of Reviews* has been phenomenal, and its editor's telegraphic address, "Vatican," points to the universal sway to which he aspires. At first it is not easy to understand why such a miracle of bad paper, bad printing, cheap illustrations, and cheaper sentiment should succeed; but the *Review of Reviews*, thanks to its editor's relations with Gen. Booth, has the support of the entire Salvation Army, while it is also bought by the many who delight in getting for sixpence that which they think people have hitherto had to pay shillings monthly or a club subscription yearly to obtain. The *Daily Graphic*, as an illustrated daily, has had, of course, many difficulties to surmount, but the shortcomings of a printing-press not yet perfectly adapted to meet its requirements cannot be held responsible for poor or amateurish illustrations. The *Daily Graphic* does occasionally give its printers a chance to show what they can do with good drawings. But the most that can be said for it is that it has lived a year, and promises to increase in public favor. Certainly in 1890 there was no notable new journalistic experiment which could help to raise popular journalism from the slough of mediocrity and worse into which it has fallen in England.

With the new year, again, three new papers have seen the light—the *Anti-Jacobin*, *Black and White*, and the *Strand Magazine*. The first, a weekly, though it differs from the *Speaker* in its political principles, is like it inasmuch as it addresses but a small audience and can have no substantial effect, for good or evil, on the great populace that reads and enjoys *Tit-Bits* and *Ally Sloper*. *Black and White*, on the other hand, aims at reaching the thousands as well as the hundreds. It is an illustrated weekly, the rival of the *Graphic* and the *Illustrated News*, and its success, therefore, must depend chiefly on its illustrations. If these two papers had kept to the high artistic level which they attained in the beginning, in the days when English draughtsmanship was greatest, there would be no room for a third. But they have both degenerated year by year, though they still maintain their old standing because of the Englishman's preference for that with which he is most familiar, and his curious conviction that anything, especially any drawing, that is actually printed and published in England must be good. For a well-edited illustrated weekly, therefore, the field is practically open, and the managers of *Black and White* say they are determined to surpass everything that has yet been done. To be honest, their first number, the only one which has as yet appeared, is not reassuring. Judging it by its illustrations, to its editors names are of more importance than the work to which they are signed: a picture is still a picture, whether good, bad, or indifferent, while there seems somewhat of a want of judgment in wasting a good wood-engraver's time in reproducing drawings which would really come better by "process," and a want of artistic feeling in enclosing all the large prints in inartistic lines cut to look like a frame. How many years is it since the *Graphic* gave up doing very much this same thing? However, allowance should be made for first numbers, and it may be that *Black and White* has a brilliant artistic, as well as financial, future before it.

As for the *Strand Magazine*, I do not think I should even refer to it had I not seen such misleading statements written in its praise by English correspondents of American papers. It is merely an enlarged and monthly *Tit-Bits*, intended solely for the *Tit-Bits'* class of readers. It is published by the same proprietor, Mr. George Newnes, who, of all men, has known best how to make a newspaper pay, but who is looked up to as a public benefactor by the British great lower middle-class. His magazine is, on the whole, better than one expected; it is made up chiefly of translations of well-known and no longer new French, German, and Russian stories, and its illustrations might be a great deal worse. But, as a sixpenny magazine, it does not compare with the *English Illustrated*, which, dull and uninteresting as it often is, sometimes does publish good engravings and drawings and gives only original matter in its letter-press. Those who think Mr. Newnes's magazine wonderfully cheap at sixpence forget to compare it with the *Century* and *Harper's*, which are, after all, one only double, the other a little more than double its price, but infinitely superior in every way.

It is frequently said that the demand creates the supply, that the people like bad art and bad literature, and, therefore, that only second and third-rate publications have any chance of success; or, as Whistler has it, when that which is born of the millions goes back to them, it charms them, for it is after their own heart. It is true that the critical sense of the people counts for nothing. But the responsibility for the printed trash with which they are deluged lies really, not with them, but with the publishers and editors who furnish it. The people have always taken that which has been given them in art, as well as in literature. When good work has been provided, they have profited; when bad work is substituted, they must suffer. By stooping to the millions their standard can never be raised, and their minds are weakened, not strengthened. And to-day, when every man, woman, and child can read, the harm done by trivial, vulgar, and sensational papers and periodicals, published at a price within the reach of all but the very poor, is more serious than it has ever been before. It is for this reason that the display made in the English bookstalls is one of the most depressing sights in England.

Correspondence.

THE WEST AND SILVER.

To the Editor of The Nation:

Sir: I have read with great pleasure your discriminating and commendatory editorial on Mr. Cleveland's letter on the silver question, and dissent only from so much thereof as seems to convey the idea that on this question the people of the Western States are less sound than those of the East. It is a mistake to underrate the intelligence of the Western agricultural population. The result of the late Congressional elections indicates greater progress in correct economic ideas on the tariff among the farmers of the West than among those of the East. Given free silver coinage as the issue and a three months' campaign, and I undertake to say that that policy would be voted down in Wisconsin, Iowa, Illinois, and Indiana by decisive majorities. I have less knowledge as to Ohio, Michigan, and Missouri, but believe that the result would not be different in those States. Fortunately for the country, the thinking and voting are not done by the frothy politicians who vapor wildly in Congress and State Legislatures as to what the people want, seeking by extravagant advocacy of every fleeting popular folly to further their own political fortunes. All the great journals of this city are opposed to free silver, and their circulation is extensive in the States mentioned. It is easy to see that even in States further west this policy has now many more advocates than it can command hereafter. I firmly believe that right here in the great Mississippi Valley Mr. Cleveland has not impaired his hold on popular confidence by his manly and timely utterance, but strengthened and increased it rather. Comparing him with many of his critics, I can find no more appropriate characterization for the latter than in the words of Burke:

"In truth the tribe of vulgar politicians are the lowest of our species. There is no trade so vile and mechanical as governments in their hands. Virtue is not their habit. They are out of themselves in any course of conduct recommended only by conscience and glory. A large, liberal, and prospective view of the interests of States passes with them for romance, and the principles that recommend it for the wanderings of a disordered imagination. The calculators compute them out of their senses. The jesters and buffoons shame them out of everything grand and elevated. Littleness in object and in means to them appears soundness and sobriety."

S. S. Gregory.

Chicago, February 21, 1891.

DOES THE SOUTH WANT THE FORCE BILL?

To the Editor of The Nation:

Sir: Is it possible that the Atlanta *Constitution* and other Southern papers do not foresee the probable result of their effort to prevent the nomination of Cleveland because of his views on silver, supposing that the effort should prove successful? Cleveland's letter has made it impossible—if, indeed, it was not already impossible—to elect a free-coinage Democrat as President. No one will dispute this after calm reflection. The South has not electoral votes enough to choose a President alone, and the Northern States necessary to make out the number are admitted to be against free coinage, with the possible exception of Indiana. There is no hope of sufficient aid from the West, as the Farmers' Alliance has everything in its power there which is not safely Republican. A free-coinage Democratic candidate, then, means simply an easy Republican victory, which would seemingly reverse the verdict of last November, and thus secure sufficient Republican support to pass the Force Bill and other obnoxious measures to secure continuation of power. It would *not* bring free coinage, and most surely *would* perpetuate the McKinley theory of taxation—an admirable scheme for draining the money of Southerners into the pockets of Pennsylvanians. Will the South sacrifice relief from this burden and immunity from force legislation merely to make an ineffective demonstration in favor of free coinage? If so, then the magnificent battle of the last few months, in which it has had the

aid of every Democrat and Independent of the North, will have been fought and won in vain.

***

BOHEMIAN "ANARCHISTS."

To the Editor of The Nation:

Sir: In your issue of the 5th inst. there appears an editorial article on the "Quality of Our Latest Immigration," in which you say: "The countries which contribute most heavily to the Anarchist population of our large cities are Austria and Bohemia, and, though those countries send us some industrious immigrants who become desirable citizens, there is good cause for uneasiness in the rapid growth of additions from those quarters."

Permit me to state my belief that you are somewhat mistaken in the facts. Some years ago there were serious Anarchist troubles in Chicago, in consequence of which a number of persons were sentenced either to death or to imprisonment. The Bohemian population of Chicago at that time was already very large; it is now about 60,000 souls. The Austrians were also quite numerous. But among the persons sentenced there was not one Bohemian or Austrian, and, so far as my knowledge goes, none of them were implicated. It may be, and probably is, true that among the Bohemians of Chicago there are some individuals of Anarchist tendencies. The same may be true of other large cities, and particularly of New York. But, on the whole, their number is insignificant in comparison with the entire body of the Bohemian population of those cities, not to speak of the large Bohemian farming population throughout the Western States; and it certainly is not increasing. Wherever, in our large cities, there is a tinge of Anarchism among the Bohemians, you will find on investigation that it springs from their contact with German Anarchists here or in the old country, and that it is confined to those who imbibe it through their knowledge of German speech. It would be manifestly unjust to blame the whole German population for the existence of a certain Anarchist element in its midst; and it would be equally unfair to charge the Bohemians with Anarchism because some individuals embrace those subversive theories. Such an unfair charge, however, has been made on different occasions and blindly repeated.

In all their characteristics, the Bohemians strongly resemble the Germans, which naturally follows from the intimate contact and intermixture of those two races for a thousand years. In all our large cities where they have gained a foothold—except, perhaps, in New York, where the conditions are not favorable—the Bohemians try hard to acquire property, and their success in different cities has been quite remarkable. The Bohemian farmers in all the Western States, and as far south as Texas, have become proverbial for their thrift and rational system of husbandry. Within the last forty years they have brought large sections of country under cultivation, creating thousands of flourishing farms, and forming a most valuable class of our Western population. On the whole, the Bohemians of this country are good citizens, proud of their American citizenship, and highly appreciative of the advantages offered to them by this great country, with its free institutions. They excel as taxpayers, and business men dealing with them readily acknowledge that "bad debts" among that class of people are comparatively very rare. They can read and write in their own language almost without exception; besides, the sale of Bohemian and English dictionaries and "interpreters" in this country is very large, which proves that, as a rule, they strive to acquire a knowledge of English from the moment they land on our shores.

There are at present about thirty newspapers published in this country in the Bohemian tongue, dailies and weeklies; and of that number there is but one which may perhaps be said to further socialistic or anarchistic views. This I take to be a conclusive proof that this country has nothing to fear from "Bohemian Anarchism."—I am, sir, most respectfully yours, Charles Jonas.

Racine, Wis., February 23, 1891.

THE SPEAKER AS PREMIER.

To the Editor of The Nation:

Sir: The *Atlantic Monthly* for March has an article by Prof. A. B. Hart which, coming from such a source, I confess to having read with extreme surprise. Mr. Hart narrates the growth of the power of the Speaker in our House of Representatives—how, in 1790, he received the power of appointment of committees merely as a matter of administration; how, inasmuch as these committees have power to strangle any legislation which they do not like, and more power than anybody else to forward any which they do, the Speaker had, by 1840, come largely to control legislation through the committees; how between 1880 and 1890 this power was reinforced by the "recognition" for party purposes as between different claimants to the floor; and how, in the last Congress, this weapon of recognition was wielded for and against the personal friends and enemies of the Speaker. Up to this point I agreed with what seemed a clear and forcible account of the greatest danger with which our Government is threatened. To my amazement, a fifth premise led up to a totally different conclusion.

There is a Committee on Rules, consisting of the Speaker and four members, two of whom belong to the minority, and, as Mr. Hart says, "are practically excluded even from the routine business of the Committee," so that the Speaker and two members appointed by himself have the power of determining what legislation shall be considered by the House and who shall be allowed to speak for and against it. And this, Mr. Hart thinks, puts the Committee on Rules in the position of the British Ministry, who determine what measures shall be submitted to the House of Commons to the exclusion or subordination of private bills. He goes so far as to think the Committee on Rules not only an evolution from, but a great improvement upon, the confusion of the committees. He says that out of more than 13,000 measures submitted to Congress, nine-tenths were suppressed by the committees, but he does not say that which one in ten was adopted was mainly determined by the operations of the lobby, or that if a further power of suppression is given to the Committee on Rules, the resultant precipitate will before long depend upon still worse considerations.

Surely Mr. Hart does not need to be told that the British Prime Minister and the Speaker of the House of Commons perform functions as wide apart as the poles. Fancy suggesting to an Englishman that the Prime Minister might as well occupy the Speaker's chair, and preside over and control deliberations, and at the same time decide what measures the House should take up, appoint the select committees to examine and report upon them, and again decide who should be allowed to speak for and against them in the House. Your hearer would in all probability burst out laughing in your face. The Speaker of the House of Commons holds one of the most splendid positions in the world for the impartiality and the justice with which he rules its deliberations, though, lest I should be accused of Anglomania, I remark that he is in this respect no whit superior to the average moderator of the New England town meeting. Being independent of and above suspicion of party, the Speaker is elected almost unanimously, and frequently the same man for two or more Parliaments. The Ministry are just as much subject to him and are treated in the same way as the most insignificant country member, while his most important function is the protection of the rights of the minority.

But there is more than this. The British Ministry are the executive power. They not only determine what measures the House shall consider, but they prepare those measures, which is the only means by which administration can be successfully carried on. They are responsible for the results of those measures, and not only are they keenly criticised while in power, but they know that even after they are in opposition, their successors will visit failures upon them and their party. Our Speaker is responsible for nothing. He has nothing to do with the Executive, and cannot be held accountable for the effect of measures. He does not even prepare them, but selects some of those submitted by other men; and though he may determine what the House shall consider, the House must pass the measure, and therefore have the nominal responsibility. In short, with enormous power and temptation, our Speaker has hardly any responsibility at all.

No doubt the present position of our Speaker is an evolution from the necessity of some leadership in such a chaotic body as the House of Representatives; and, as Mr. Hart says, inasmuch as the tendency with us is to exalt the Legislature at the expense of the Executive, the power of the Speaker will continue to increase. But that is all the more reason why good citizens should cry aloud on the corners of the streets, as they point out the danger; why they should demand the restoration of the balance of power between Executive and Legislature; why the Cabinet officers should be admitted to take part in the proceedings of the houses, in accordance with the Senate report of February 4, 1881, forming a better representative of the English Ministry and a copy more perfect than the original; and why our Speaker should be ejected from his false functions and remanded to his true and invaluable ones, those of the English Speaker and the moderator of our town meeting. G. B.

Boston, February 27, 1891.

HONOR TO WHOM HONOR.

To the Editor of The Nation:

Sir: In July, 1888, Prof. J. H. Wright read a paper before the American Philological Association at Amherst, in which—following a hint of Busolt's—he aimed to prove that Cylon's attempt to make himself tyrant of Athens took place before the time of Draco and his reforms (and not, as generally supposed, as late as 612 B. C.), and that it stood in distinct though hitherto unsuspected relations with the social changes that culminated in the reforms of Solon.

The theory was based on an independent examination of all the evidence then available—not only the statements of Herodotus and Thucydides as interpreted by the writer, but also what he believed to have been the language of Aristotle in his lost treatise on the

'Constitution of Athens.' The statements of Aristotle Prof. Wright endeavored to reconstruct from the secondary sources—Plutarch, pseudo-Heraclides Ponticus, etc. Only an abstract of this paper (Proceedings Amer. Philol. Assoc. for 1888, p. xxvi.) was printed at the time. The treatise was afterwards rewritten, and in August of last year it was placed in the hands of the editors of the Harvard Classical Studies for publication, much enlarged and fortified by new arguments. In the ordinary course of events it would have appeared in the immediately forthcoming volume ii. But, for reasons of a purely external nature, involving blame to no one, the editors, with Prof. Wright's consent, decided to postpone the publication of this paper and to make it the initial article of volume iii.

Meanwhile come the interesting tidings of the acquisition and publication by the British Museum of a newly discovered papyrus manuscript of Aristotle's 'Constitution of Athens.' From the accounts so far published (the text of the document has not yet come to hand), it appears that this find affords the amplest and most gratifying confirmation of Prof. Wright's theory. Here, in the introductory historical sketch, where events are given in chronological order, the account of the Cylon affair (not, however, preserved in the papyrus, but only referred to) precedes that of Draco's reforms, and is separated from it by a mention of the purification of the city for the slaughter of the insurgents, and by an interesting description of the Constitution at that early period. This remarkable discovery, nevertheless, robs Prof. Wright's paper (supposing the manuscript to be authentic) of much of its independent value, since the matter under discussion is now transferred from the class of uncertain questions to that of established historical data. And the paper, as finally printed, must undoubtedly be modified here and there in accordance with the new light.

As one of the editors of the Harvard Studies, I deem it proper, in justice to Prof. Wright, to call attention to the fact that his main thesis was propounded more than two years ago, and was set forth in elaborate written form six months before the discovery of the new manuscript was known to American scholars. FREDERIC D. ALLEN.

CAMBRIDGE, MASS., February 22, 1891.

THE SIDON SARCOPHAGI.

TO THE EDITOR OF THE NATION:

SIR: In describing the Sidon sarcophagi (Nos. 1332, 1333) I referred to the first *fascicule* of Hamdy Bey's illustrated work as probably published at the time of my writing, which was the original intention. A letter informs me that the material for the first fascicule has been for some time in the hands of the publisher (Leroux of Paris), and that it will appear about the end of March. Besides the introduction, and part of the description of the tombs in which the discovery was made, this fascicule will contain a description and discussion of the sarcophagus of "The Weepers."

The same letter informs me that the difficult work of restoring the cover of the great sarcophagus has been completed. This cover was in 126 pieces. It was necessary to drill 266 holes, and make use of 132 bronze clamps to join these pieces together. This will give some idea of the amount of labor which has been required to prepare the sarcophagi for exhibition. JOHN P. PETERS.

PHILADELPHIA, PA., February 24, 1891.

Notes.

EIGHT lectures given a year ago at the Lowell Institute, Boston, by Mr. Louis Dyer, late assistant professor at Harvard College, have been carefully revised, and will be printed with notes and appendices under the title of 'Studies of the Gods in Greece at Certain Sanctuaries Recently Excavated,' Macmillan & Co. being the publishers. The volume will contain Dörpfeld's plan of the Eleusinian Temple from the Proceedings of the Royal Institute of British Architects, and, by permission, Elsey-Smith's plan of Patmos from the *Journal of Hellenistic Studies*.

Henry Stevens & Son, London, announce 'The Discovery of North America,' by Henry Harrisse, being a critical and documentary investigation, with an essay on the cartography of the New World, and an account of 250 ancient maps and globes, existing or lost. The work will form two large quarto volumes, with 25 facsimiles, and is set down to appear early in the spring of 1892, so as to coincide with the 400th anniversary of the discovery of America. It will be got up in three styles of varying attractiveness and costliness, and issued only to subscribers.

Charles Scribner's Sons announce as in preparation a new edition, brought down to date, of Brander Matthews's 'French Dramatists of the Nineteenth Century'; 'Spain and Morocco: Studies in Local Color,' by Henry T. Finck; and 'A Publisher and His Friends: Memoir and Correspondence of the late John Murray,' by Dr. Samuel Smiles.

Harper & Bros. have in press 'Flute and Violin, and Other Stories of Old Kentucky,' by James Lane Allen.

Mr. Richard Malcolm Johnston's volume, 'The Primes and Their Neighbors,' about to be brought out by D. Appleton & Co., will consist mostly of short stories of middle Georgia which have already appeared in the magazines. One new one, "The Durance of Mr. Dickerson Prime," will be added.

A collection of the poems of the late Horatio Nelson Powers is being edited for D. Lothrop Co., Boston, by Mr. Oscar Fay Adams.

A Life of the late General Sherman, composed by Gen. O. O. Howard and Willis Fletcher Johnson, is in course of production by Hubbard Bros., Philadelphia.

Ginn & Co. have in press 'Principles of the Algebra of Logic,' by A. Macfarlane; and the 'Prometheus Bound of Æschylus,' with Wecklein's introduction and notes translated by Prof. F. D. Allen.

An essay on Compulsory Voting, by Frederick William Holls, will be shortly published by the American Academy of Political Science in Philadelphia.

Miss Mary E. Burt, whose suggestive and original little book, entitled 'Literary Landmarks,' we had occasion to recommend some time ago, carries out the plan there described for the teaching of literature by publishing the first of four volumes on 'The World's Literature' (Chicago: Albert, Scott & Co.), as a course in English for schools and colleges. The book is made upon a singular plan. Instead of reducing to her own words the authorities upon which she has drawn, Miss Burt has simply made long extracts from them in the original pages. The consequence is, that there is very little matter in the volume which could be protected by an American copyright. The subject treated is the Myth in general and Homer and Hesiod. The method followed is to reprint *in extenso* from Ruskin's 'Queen of the Air' and Carlyle's "Hero as Divinity," and also less generously from the works of J. Addington Symonds, Max Müller, and Gladstone. Homer is then treated by giving long extracts from Earl Derby's and Butcher and Lang's translations, attention being confined to the character of Achilles and Ulysses. Hesiod occupies only a few pages at the end. The scheme of abstracting in this way sufficient portions of the greatest works of the world's literature to give a knowledge of their nature and their sequence in civilization, may well prove useful for younger students and those who have little leisure and some desire for acquaintance with these works; but the question of the rightfulness of such free use of "authorities," for which it is not stated that permission was obtained, is a nice one, though an international copyright law probably would decide it very quickly, so far as the future is concerned. Apart from this consideration, the work is very well done, and should be serviceable in the study of literature by students of high-school age.

A brief and carefully systematized account of English Versification (Leach, Shewell & Sanborn) has been prepared by the Rev. James C. Parsons for the use of schools. It is the result of the author's experience in teaching, and shows acquaintance with what has been written upon English metres by the most learned authorities. The scheme includes a description, with examples, of all varieties of metre, together with notices of the methods by which writers of verse endeavor to vary the normal line, and at the end there is added also an account of the stanzaic forms of poetry, including the recent French importations. The author's judgment is good, and, though the work is elementary and occasionally stiff, the neophyte in verse may profit by the rules and suggestions which constitute the substance of the volume.

Mr. A. Wilson Verity edits for the Pitt Press Series of the Cambridge University Press (Macmillan) Milton's 'Arcades and Comus,' with the elaborate apparatus of notes and introductions characteristic of the present standard of school texts. The little essay on the history of the masque in English is the most notable feature of the volume, and gathers together much that is of interest about this literary form. All that is known of 'Comus,' biographically and bibliographically, is to be found here, and in the appended notes there is a large amount of philological learning. This last matter is, in our judgment, much overdone. The editor is somewhat more free than most of his predecessors in admitting Milton's obligations to preceding poets in English, but not more free than his citations justify him in being. Milton took epithets from other poets as Gray took them from him, and he also imitated the melodic structure of his favorites. The editor finds a pleasant name for this "plagiarism," styling it "the lampadephoria of literature." The work is very thoroughly done, and errs only by that excessive elaboration which it seems impossible to counteract.

Sir Philip Sidney's 'Apologie for Poetrie' is edited in the same series and with the same care by Mr. Evelyn S. Shuckburgh. He follows Arber's reprint of the 1595 edition, which, however, he has taken the pains to collate with an original in the British Museum. The spelling is not modernized. A very serviceable Life is furnished, in which, it is to be observed, the date of Sidney's birth is given as November 30, 1554, instead of November 29, on the authority of a MS. Psalter in Trinity College Library. There is no elaborate literary criticism or other extraneous matter, and the notes, though of the usual fulness, are more marked

by the illustrations they afford of contemporaneous literature than by philology. The edition is at all points admirable.

Mr. E. C. Wickham's edition of Horace is now completed by the publication of the 'Satires and Epistles,' with an explanatory commentary (Oxford: Clarendon Press; New York: Macmillan). It is of the same standard of excellence that marked his first volume, which was issued some fifteen years ago. The Latin text is constituted on the principles which were then set forth, and which Mr. Wickham has seen no reason to abandon. There are essays on the contents and nature of the Satires and Epistles, the collation of the Queen's College MS. is finished, and the volume ends with two good indexes to the entire work.

The historical and descriptive volume, called 'Hampton and Its Students,' published by the Messrs. Putnam in 1874, closed with a notable selection of fifty slave songs arranged by the musical director at Hampton. These have now been issued by themselves, by the same firm, under the title 'Cabin and Plantation Songs as Sung by the Hampton Students,' but with a considerable accession from the Fiske Jubilee Collection and from other sources. And inasmuch as Hampton trains the negro and the Indian together, three Sioux songs have been added; besides which one Japanese, two Hawaiian, one Chinese, and one Turkish song are introduced with reference to the varied nationalities in a certain Hampton choir whose portraits serve as frontispiece. This enlarged edition will, we hope, not only meet with favor for its own sake, but also redound to the advantage of the institution from which it emanates, and which may fairly be called the most interesting as it is one of the most deserving in the whole country.

We have already reviewed the 'Letters of Lord Chesterfield to his Godson,' and it is enough to say of the authorized American edition before us that it appropriately forms part of the Messrs. Putnam's pocket series of "Knickerbocker Nuggets," filling two volumes.

A correspondent complains that purchasers are in danger of being misled by the action of Dodd, Mead & Co., publishers of "Histories of the Old World," in adopting into that series Mr. S. Baring-Gould's 'Germany, Past and Present,' and lettering it 'History of Germany' on the back, as if a distinct work. Still, it is to be hoped that few persons buy books merely from the backs.

The bound volume of the *Overland Monthly* for the last half of the last year is numbered the sixteenth, and is a pleasant reminder of the maintenance on the Pacific Coast of the solitary literary magazine west of the Alleghenies that can rank with the best of those to the east. It does not, of course, draw upon the same variety or degree of talent which is at the command of editors on these Europe-fronting shores; but, if its cup is not large, it serves to drink out of, and the editing is serious and high-minded. The department of book-reviewing is carefully cherished, and is noticeably comprehensive. The *Overland* sometimes attempts pictorial illustrations, but the present volume is devoid of them. Every one who has a just conception of the tone of society in California must feel an interest in the success of such an influence for good as this publication, which has had its period of storm and stress and is doubtless still not unattended by discouragements.

The two chief theatrical annuals in our language, the British '*Era* Almanack' and the 'New York *Clipper* Annual,' try to make up for their obvious inferiority to their French rivals by a greater promptness in publication. The most interesting part of the '*Era* Almanack' is the account of certain "Old London Theatres," with reproductions of old plates. The "Record of New Plays," etc., is as valuable as usual; and the more literary portions, stories and the like, are quite as valueless as usual. The Records are also the most useful part of the 'New York *Clipper* Annual,' which contains four pages of portraits of American actors and actresses.

The latest American novel to be included in the series of foreign works of fiction published in Paris by Hachette is a translation entitled 'Monsieur Barnes de New York.'

The sixth part of the supplement of 'Danmarks Statistik' (The Statistics of Denmark) contains many statements of interest to students of economics. Figures in regard to the public debt, the condition of the treasury, the income and expenses of the State, the different budgets, the number and size of the schools, and many other matters connected with the public administration, are given with great fulness. The account of taxation in Denmark is of special value, showing as it does a considerable increase in returns since 1877. The pension list has been sensibly lowered since 1867. A great decrease is noted also in the tax on brandy, due in the main to the more general use of beer among the lower classes. Students of pedagogics will find many interesting figures under the head of education. In 1875 women were for the first time admitted to the University, and since then sixty-one have been matriculated. The number of theological students has advanced greatly during the past ten years, and, if the proposed increase of the Copenhagen churches be carried out, will undoubtedly increase still further.

Carl Schoenhof, Boston, sends us samples of the "Biblioteca Italiana" issued by Hachette & Co., with English vocabulary and notes. These handy and inexpensive little volumes contain comedies by Goldoni, Alfieri's "Oreste," Maffei's "Merope," and a couple of tales by G. Carcano. They are well adapted for the private study of a language far too generally neglected among us.

There was, after all, a certain undue haste in the recent publication of Aristotle's 'Constitution of Athens.' Mr. F. G. Kenyon, M.A., Fellow of Magdalen College, Oxford, had the good luck to discover it more than a year ago in the first roll of papyri given him to examine. The secret, kept for more than a year, threatened to leak out early in January last. Hence the full account of the startling discovery which appeared from the Museum authorities on the 19th of that month, and which did really take most of the knowing ones by surprise. Within ten days of that time, the text, with Mr. Kenyon's minute commentary, was in the hands of subscribers. But now the book has suddenly disappeared from the market, and there is delay in the promised publication of the facsimile. Rumor has it that, in the haste of publication, the accentuation of the text was intrusted to unskilled hands. The original papyrus shows only three accents and two breathings.

The University of the State of New York has lately issued a bulletin from its Museum in Albany on our local building stones, by Prof. John C. Smock, now State Geologist of New Jersey. An earlier bulletin by the same author gave a list of the quarries in the State; the present number contains a description of the quarries, with an account of the various kinds of stone they yield and a reference to the more important edifices throughout the State in which the stones are used. A map indicates the distribution of the quarry districts.

In this connection we may call attention to Bulletin No. 3 of the State Geological Survey of Missouri, where Mr. Arthur Winslow holds the position of State Geologist. This Bulletin contains an account of the clay, stone, lime, and sand industries of St. Louis city and county by G. E. Ladd, Assistant Geologist, and of the mineral waters of Henry, St. Clair, Johnson, and Benton Counties, by A. E. Woodward, Assistant Geologist. Both are prepared in good form for easy consultation, with side-headings and numerous tabular accounts of structure, products, and analyses.

Bulletin No. 2 of the same Survey contains a bibliography of the geology of Missouri by F. A. Sampson: a full list of everything relating not only to the geology, but to the several organizations of the State Survey as well, such as Governor's messages and the reports of various State officers bearing on these matters. 810 titles are given. The convenient arrangement, with tables of contents, index, and other aids to practical use, will create a wide call for this bulletin. Other State surveys might well follow the example of Missouri in thus preparing an account of themselves. The Franklin Society of Providence has done so for Rhode Island, but we do not recall any other example of the kind. Lesley's 'Historical Sketch of Geological Explorations in Pennsylvania' is arranged on quite another plan, and does not pretend to bibliographic completeness. The preparation of such lists as these may be recommended to advanced students in our colleges.

Houghton, Mifflin & Co. have added to their well-known lithographic "*Atlantic* Portraits" a very successful reproduction of Mr. Gutekunst's photograph of James Russell Lowell, at life-size. To us it seems quite equal to the best of the series to which it belongs.

Mention was lately made in these columns of Mr. Sidney S. Rider's Inquiry [in his own *Book Notes*] concerning the authenticity of an alleged portrait of Roger Williams. This exposure well deserved to find a place among the Rhode Island Historical Tracts, and Mr. Rider has just issued it as No. 2 of the second series (Providence).

An account of a recent journey to Tashkent, by Capt. A. C. Yate, which is the first paper in the *Scottish Geographical Magazine* for February, adds little to our knowledge of the progress of Russia in Central Asia. Gen. Annenkoff, the constructor of the railway, was met at the bridge over the Oxus. Among other things he showed his visitor a school in which were seventy boys and girls, saying, "When I start a cantonment anywhere for my railway troops, among the first things I construct are a school and a church." It is the policy of the Russian Government in its Asiatic possessions, in contradistinction to that of the English in India, to encourage by every possible means the learning of the Russian language by the natives. This has been carried out with such success within the past twenty-five years, that "all the inhabitants of the towns, and many of those in the country, have learned Russian." Prof. J. Geikie treats of the geological results of Dr. Nansen's expedition, saying among other things that if it has "thrown no new light on the disputed question as to the cause of the high temperature which formerly prevailed in Greenland, it is needless to say that it has added considerably to our knowledge of the present physical conditions of that country."

The February Proceedings of the Royal Geographical Society opens with an account of explorations made in Alaska last year by

Lieut. H. W. Seton-Karr. The scene of his operations was the mountainous region lying at the headwaters of a branch of the Chilcat River and just behind the Mt. St. Elias group. In strong contrast to this rugged glacier-covered region is the country between Lakes Nyassa and Tanganyika in Central Africa described by Mr. D. K. Cross. Here high hills, rich valleys, and undulating pasture land alternate with plains covered with gardens and plantations where "you may walk from sunrise to sunset and never be outside the shade of the bananas." The villages, built of bamboo and small round bricks, are swept daily; the natives' love of neatness extending to their cattle, which are "tended with the greatest of care, housed properly, washed and brushed down at regular periods." The ear is filled with the sound of the tinkling cow-bells and the reed-flutes of the herd-boys. The land is carefully cultivated and wonderfully productive, bearing two or three crops in the year. Mr. Cross sharply criticises Prof. Drummond's unfavorable statements in 'Tropical Africa' regarding Nyassaland, which were made from a very limited experience of the country at the head of the lake during the dry season. Mr. Cross also gives some account of a visit to the southern shore of Lake Rukwa, which he believes to be much larger than the maps represent it, estimating its length from 80 to 100 miles and its breadth 30 or 40. It is apparently drying up with great rapidity from an extraordinary and unaccountable lack of rain in recent years.

—There is little to note in the March *Century* beyond the continuation of the historical papers which are so marked a feature in the value of this magazine, but are too fragmentary to call for comment. Frémont's expeditions are the subject of a block of articles, and there is the usual collection of "Californiana." "General Crook in the Indian Country" is a cognate paper. Talleyrand's "Memoirs" continue in the Napoleonic period, and bring out repeatedly his plea that in being false to Napoleon he was true to France and Europe. Life in a Northern prison during the Rebellion is the subject of a new war article. The Thibetan journey continues its rather monotonous course. The special articles of the number are a pleasantly written account of the Century Club, with illustrations, and a description of the social aspects of Australian cities, from the point of view of a political observer. The usual fiction fills out the number.

—*Harper's* for March opens with a most dismal account of Buenos Ayres by Mr. Theodore Child. He finds the impression made upon him by the city and its social conditions "wholly and repeatedly that of coarse and brutal materialism." The volume of business done is striking, and the life of the streets noisy and boisterous, but the wealth acquired in the last ten years has been expended in vulgar, showy, and cheap ways. The architecture is described as not adapted to the country, the housing of the poor as of the worst sort, and the moral habits of the city as more offensive than elsewhere. Of intellectual life there appears to be nothing, and the dependence of the journals is mainly upon Paris. There are "no amenities of life," "no amusements except the theatre, which is expensive," "no distractions except gross and shameless debauchery," "no society," "no social leaders," "no leaders of opinion," etc. Altogether, a more unfavorable view of a great city could not well be drawn, and the sins of the Argentine metropolis must be great indeed to draw down such a condemnation from a traveller who has not shown himself narrow in interest or sympathy, or hard to please. Following upon this article comes an account of the smuggling of Chinese laborers and of opium into the United States, mainly across the Canadian border. It is the fruit of personal inquiry, and seems to be temperately written; and as the information is of a sort difficult to obtain in a trustworthy shape, the paper is of more than ordinary value as a criticism on our Chinese and customs laws. Mr. Lang's comment upon Shakspere's "Comedy of Errors" certainly makes the most of that not very popular play, and is especially felicitous in pointing out the Shaksperian element in the modification of the plot and the treatment of the characters as compared with Plautus. Mr. Laurence Hutton writes in his usual careful and encyclopædic manner of the throng of literary folk who have left memories in Edinburgh, and the article is effectively illustrated by a number of cuts which present the "gray metropolis of the North" to the eye. Two special articles, upon "American Leads in Whist" and on "Nationality in Music," deserve mention, as does also the always welcome writing of Thomas Hardy, who begins a series of papers on "Wessex Folk." Mr. Curtis, in the Easy Chair, pleads for smaller halls, shorter dinners, and fewer speakers, as a desirable reform in public dining. The number is unusually varied, and strong in each article.

—The *Atlantic*, which comes this month without any poetry, is distinguished by a number of articles of serious character, and maintains throughout a high average. The beginning of Mr. Parkman's narrative of the capture of Louisbourg is by itself sufficient to give the number unusual interest, and it is written with the author's ordinary vivacity and skill in character-drawing and in the grouping of detail. It is matter for congratulation that this striking episode of old New England life is to be treated by such a master of the picturesque in style as well as of historical knowledge; but we shall have another opportunity to speak of the work when it is completed. Of unusual interest, too, is the fragment of autobiography in which the late James Freeman Clarke tells of his school days. His education belonged to the unreformed period of our public instruction and the days before juvenile literature, when boys learned Latin before ten years of age, and were glad to read classics of their own tongue which now would be hardly endured as a punishment; but Mr. Clarke throve under the old discipline, and he spends much time in criticising our own methods of primary instruction, particularly in grammar, with all his old vigor and independence. It is a paper especially to be recommended to teachers. What improvement education has made in our country, more particularly in the college system, is the subject of the next article, on "The State University in America," by Prof. George E. Howard of Nebraska. The writer has collected his facts with great thoroughness, and he has arranged them with admirable clearness in order to show the tendency of State education in the past, and to forecast the place to be held by it permanently in the greater number of States. His comments, too, are sound and characterized by political thoughtfulness. Two other articles upon public questions cannot be passed over by political observers: Prof. A. B. Hart's brief and compact résumé of the powers of the Speaker and his place in our system as compared with an English Premier, and Prof. Hadley's survey of "The Railroad Problems of the Immediate Future." Prof. Hart seems to approve of the enlarged powers of the Speaker, and more especially of the influence which comes to him as a member of the Committee on Rules; and Prof. Hadley's position is noticeable for its reactionary attitude towards Governmental control or legislative interference with railroad business. We can only mention the sympathetic sketch of Grant White's personality, with its entertaining account of his Tory and Catholic grandfather, and the scientific discussion of the principle of heredity, which is the most "solid" paper.

—*Scribner's* continues its very interesting serial subjects of Japan and Africa, and has a few special features of note. Sir Edwin Arnold devotes much of his space to the praise of the Japanese woman, and presents her attractions in the most favorable way, not without some dispraise of ungallant, not to say barbaric man—for this last epithet, though just enough in connection with the subject, would hardly chime with the other adjectives of eulogy which the author lavishes on his favorite people. Lieut. Jephson's narrative of life in the Stanley expedition is very well done. Mountaineering has a topic in this number in the ascent of Mt. St. Elias and a description of its glaciers. The freshest article, and one which is indeed unique, is Superintendent Parsons's paper on the "Ornamentation of Ponds and Lakes," with some beautiful illustrations; but it does not permit of abridgment. Mr. Nadal's account of London and American clubs is sufficiently well-informed and comprehensive, but not remarkable in any way. An unusually carefully studied piece of literary criticism, by Mr. Clymer, deserves mention if only for its rarity. The subject, Jane Austen, is perhaps not well selected for a first essay, and in the treatment of it there is something too obvious in the emphasis put upon her provinciality, and too paradoxical in the comparison of her with Maupassant; the whole manner, too, is over-reminiscent of other critics' phrases and ideas. But these faults are of the sort usually regarded as excellent in new writers, and Mr. Clymer's patience, thoroughness, and evident desire to be just, although cosmopolitan, are traits so rare in literary criticism among us that it seems ungracious to find any fault whatever with the essay. It is to be hoped that practice will accustom him to a more original and independent method, for it is quite plain that he does not need to revert continually to Mr. Henry James, Arnold, and a half-dozen other leading critics. We observe also in "The Point of View" some well-timed and well-weighed remarks on the "remarkableness" of the literary form of Miss Emily Dickinson's lately discovered muse.

—It is only a few weeks since we reviewed with the highest praise 'The Finding of Wineland the Good,' by Arthur Middleton Reeves, and now we are called on to chronicle the untimely death of the writer, which occurred on February 25 in the distressing railway accident at Hagerstown, Ind., within a few miles of Mr. Reeves's home at Richmond. Mr. Reeves was born at Cincinnati, October 7, 1856, and consequently was only thirty-five years old. He graduated at Cornell University in 1878, having displayed great fondness for literature during his college course. He was the founder of a humorous illustrated paper of considerable merit, and the subject of his graduation thesis was Frithiof's Saga, which shows how early his tastes led him to the study of the North. In 1879 he accompanied Prof. Willard Fiske to Iceland, and began the investigations which re-

sulted in the notable volume mentioned above. Mr. Reeves intended to devote himself to the study of Icelandic literature from the point of *Culturgeschichte*, and, had his life been spared, he would undoubtedly have attained high rank as a scholar. He was one of the few Americans of independent means who are drawn to a life of letters by an irresistible vocation. The news of his sudden loss will fill with sorrow many who loved in him not the scholar alone, but the man of many amiable and charming qualities.

—The Edinburgh law publishers, William Green & Sons, have reprinted, in a handsome volume entitled 'Studies, National and International,' twenty lectures delivered in the University of Edinburgh, between the years 1864 and 1889, by James Lorimer, the eminent Scotch jurist. All but three of them had been previously published, either as pamphlets, or in one or another of the four principal law journals of England and Scotland, and they were revised, with a view to their publication in book form, by the author, shortly before his death, which occurred February 13, 1890. These lectures originated, we are told in the preface, in Prof. Lorimer's custom of spending the first hour of the session "in discussing in a popular manner what seemed to be the leading public question or public event of the day." They are mainly in the field of general jurisprudence and international law, as the following titles will show: "Reasons for the Study of Jurisprudence as a Science," "Prolegomena to a Reasoned System of International Law," "English and Foreign Jurists, and International Jurisprudence," "The 'Three Rules of Washington,' viewed in their relation to International Arbitration," "Of the Denationalization of Constantinople," and "Does the Corân (*sic*) Supply an Ethical Basis on which a Political Superstructure can be raised"?—which question is answered in the negative. There is an account of the Institut de Droit International; and two lectures, delivered twenty-four years apart, deal with the sphere and functions of an academical faculty of law, while the last lecture, "The Church and the Bar," discusses the relations between theology and jurisprudence. But politics and social science were also dear to Prof. Lorimer's mind, and the volume contains lectures on "Monarchy, Republicanism, and Democracy," "Centralization and Decentralization," "Politics as a Profession," "The Land Question," and "The Idea of the Family in Modern Society," while the German wars of 1866 and 1870 furnish texts for moralizing. Finally, of more local color are the "Story of the Chair of Public Law in the University of Edinburgh" (filled by Prof. Lorimer himself since 1862), and a biographical sketch of Prof. William Edmonstoune Aytoun, the author of 'Lays of the Scottish Cavaliers.' Prefixed to the book are two biographical notices of the author, one by Robert Flint, reprinted from the *Juridical Review*, and the other, more brief, and in French, from the pen of Gustave Rolin-Jacquemyns, contributed to the *Revue de Droit International* as the obituary notice of a *confrère* in the Institute of International Law. As a frontispiece there is an attractive photogravure of a portrait painted a few months before Prof. Lorimer's death by his son, J. H. Lorimer.

SIR WALTER SCOTT'S JOURNAL.—II.

The Journal of Sir Walter Scott, from the Original Manuscript at Abbotsford. 2 vols. New York: Harper & Bros. 1890.

The pathos of Scott's Journal appeals to modern feeling, but the whole tone of the book is "old-world." Wherein consists this "old-worldness"? There is no single line, perhaps no single page, in the whole diary which, as far as language goes, might not be written by an author living in 1891. The language is the language of an English gentleman who expresses himself with perfect ease on paper in the tone of good conversation. The Journal may, in this respect, fairly enough be compared to Anthony Trollope's Autobiography. Here and there, no doubt, may be found a word or a sentence which has a slightly different shade of meaning from any expression now current. When, for example, we are told that (say) two young ladies are girls of "good principles," we feel that the praise is not exactly the form of commendation which would be employed by Trollope, and that if he had chanced to use the same words as Scott, he would not have meant precisely the same thing as Sir Walter. "People of good principles" in Scott's circles were gentlemen or ladies who showed no inclination towards social or political doctrines which we should call Whiggish, and Scotch Tories would have termed Jacobinical, and who in their conduct conformed to the moral standard of gentlemanlike honor. But though here and there a phrase in the diary may betray that it was written sixty years ago, the number of such phrases is small. It is not the language, it is the tone, the atmosphere, so to speak, of the book, which constitutes its old-worldness. Wherein consists, one again asks, this difference of tone? What is it which makes Scott's mode of looking at life different from ours? When we remember that the Journal represents (as we have already pointed out) the feeling not so much of 1827 or 1832 as the feeling of 1800, the question before us is this: Wherein did the moral surroundings of 1800, as pictured in the Journal, differ from the sentiments and the beliefs of 1891? To answer this question fully would require years of labor, and would lead to the production of a long essay, not to say a large book. But it may be possible in the space of an article to point out, in the roughest manner, the sort of answer which suggests itself to a thoughtful reader of Scott's Journal.

The differences between the tone of 1800 and the tone of 1891 are both negative and positive. We may see this if we reflect on Scott's way of looking on the two large subjects which will always constitute the main interests of thoughtful men — politics, taken in a very wide sense, and religion, to which term also we must give a very wide interpretation.

In each sphere the distinction between 1800 and 1891 is in one sense at bottom the same. At the beginning of the century there existed a body of received doctrine or established opinion, both as to social and religious questions, which was accepted as a sort of foundation of opinion by respectable men of all classes. No doubt on this foundation very different systems were reared. Still, paradoxical though the assertion may sound, we may well believe that the real affinities in their way of looking at the world between men as different as Scott, Lockhart, Jeffrey, and Sydney Smith were greater than the differences which to these distinguished men themselves seemed so important, and that all four would have felt far more at home in each other's society than could any one of them in any society in which you could place him, could he return to life at the present day. We think, for example, of Scott as a Tory, and Sydney Smith as a typical Whig. Yet the Toryism of Lord Salisbury, Mr. Balfour, or Lord Randolph Churchill would, one may suspect, be hardly more foreign to Scott than the Liberalism of Mr. Gladstone or Mr. John Morley to Sydney Smith. Scott is known to the world in the field of politics as a Tory, who resisted even the innovations in point of the Scotch currency of such very unrevolutionary statesmen as Lord Liverpool and Mr. Croker. But he was in truth by no means a very rigid Tory; his opposition to Catholic emancipation appears to have been at least wavering, and with his sound good sense, which was backed by his natural courage, he perceived that if the Catholics were to receive political rights, a generous was far safer than a niggardly measure of emancipation.

It would, again, argue the utmost stupidity, to say nothing of injustice, if any one were to suppose that Scott did not sympathize with (to use an expression of Burke's) "those who labor and are miscalled the poor." The attachment he excited in the heart of every dependent and the affection which he poured upon every person attached to his service, argued, it may be said, merely the warmth of his heart. But his insight into the wants and feelings of those who labor was at least as marked as his friendliness towards them. It has been well said that he was the first writer of fiction who claimed our interest for persons who do not enjoy wealth. And this he achieved not by appeals to sentimentality, but by giving to farmers, peasants, and laborers, as to every other class, their rightful share in his pictures of life. The 'Heart of Midlothian' is what would now be called a romance of humble life. But the insight into the position of men and women who earn their livelihood by physical toil, is as plainly traceable in all Scott's novels as in the substantially true tale of which Jeanie Deans is the heroine.

He, moreover, constantly gives to the toiling multitudes not only his sympathy, but his respect. It is here we come to the feature which distinguishes Scott's way of looking at society from the light in which it is looked at at the present day by persons who would never fancy that they were tinged with socialism and would honestly call themselves Conservatives. The different classes existing in ancient and well-governed countries, such as England and Scotland, were, in the eyes of Scott, each and all entitled to respect. The King on his throne, even when he happened to be George the Fourth, the Peerage, the gentry, the farmers, the laborers of the country, each and all were portions of a society which excited his admiration and reverence; each and all were treated by him reverentially. We may venture to say that to him, as, it may be suspected, to almost all the more eminent among his contemporaries, the state of society in Great Britain seemed fundamentally good. A laborer who did his work well was, to a gentleman like Scott, a man to be honored. But it never occurred to him that there was anything wrong or unjust in the existence of a laboring class. He wished that the most careful consideration should be given to the feelings of the poor. A marked specimen of his feeling on this matter, no less than of his insight, may be seen in his remarks on the harm that might be done by altering the Scotch metrical version of the Psalms. But there is not in Scott a trace of the savage indignation at the state of the poor which fired the soul of Carlyle, at any rate in his youth. Still less is there anything in Scott of that half-unconscious socialism of feeling which, at the present moment, seems constantly to suggest to men and women who have very comfortable existences themselves, that poverty, or even the necessity for hard labor,

springs from bad social arrangements, and that somehow or other everybody has a right to be well off.

No doubt Scott's respect for existing social arrangements depended in part on another sentiment of his day which now has, at any rate for the time, gone out of fashion, or perhaps of existence. This sentiment was a feeling of intense pride and satisfaction in the position of Great Britain. It had its root in two facts: Great Britain had been for centuries the great free State of the world. The freedom of Continental nations was of dubious character and of recent existence. In the few countries where it existed, it was the imitator of British liberty. The great free State, moreover, was the triumphant State of the world. Look at the feelings of a German after 1870, and you have a slight though inadequate picture of the proud resolution of Scotchmen and Englishmen in 1800, and of their triumphant pride in 1815. We can now see that the genius of Napoleon was a very different thing from the masterly competence of Wellington; but, after all, it was Wellington and the country of Wellington that remained conqueror in the long contest of giants. These, it will be said, were the feelings of a Tory, not of a Whig. The remark is plausible, but superficial. Grey, Russell, Jeffrey, Sydney Smith, were at bottom as ardent admirers of the social system existing in Great Britain as was Sir Walter Scott. Hallam's conviction, uttered in 1818, that the uninterruptedly increasing prosperity of England was "the most beautiful phenomenon in the history of mankind," expressed the sentiment of a whole generation.

The political differences which divided Scott from the Whigs were in one sense superficial. They had to do with means rather than with ends. He loved the Scotland and the England which he knew; he looked upon Scotland and Great Britain as the noble product of a noble history. Changes small in themselves excited his distrust because they menaced the social condition which he reverenced, and, above all, threatened not the national independence, which had no existence, but a very different thing, the national individuality of Scotland. The Whigs, too, for the most part, prized too highly the fruits of English civilization to desire any change which shook the foundations of society. They believed in reform because they disbelieved in revolution. They most of them were firmly convinced, with Hallam, that the progressive prosperity of England was "the most beautiful phenomenon in the history of mankind." Time, it may be said, has justified both Scott and his opponents. He possessed the insight, or foresight, of genius, but was not a political philosopher. The somewhat narrow political philosophy of the Whigs was sounder than the Tory doctrine of the day. However this may be, one thing is certain: Scott and Lockhart, Jeffrey, and Sydney Smith, all looked with patriotic satisfaction on English greatness and English freedom. They were not further removed from the savage Jacobinism of 1791 than from the socialistic dissatisfaction which characterizes the England of 1891.

It is easier, in many ways, to estimate the political than the theological or religious sentiment of a past age. The difficulty is increased by a fact which itself marks something like a moral revolution. In 1800 or 1830 men were on the whole reticent about their religious beliefs, and still more about their religious disbeliefs. "Atheism," says a modern preacher, "is not now at all shy." Superstition or credulity is, he might have added, equally outspoken. The religious opinions, moreover, of a generation, even when perfectly sincere, differ a good deal from their religious convictions. On a celebrated occasion Macaulay daunted an elector who tried to "heckle" him about his religious views, by the brief statement, "I am a Christian." Scott, under like circumstances, might have said exactly the same. Neither of the two men was capable of uttering a lie; but both Scott and Macaulay were prepared on occasion to vindicate their honor by a duel. In all this there is no dishonesty, nor even, if one may say so, inconsistency. But a critic may remark that the Christianity of Scott and Macaulay was in reality a mixed creed, drawn in part from the Gospels and in part from the code of honor. Now a reader of Scott's Journal must be strangely obtuse who does not perceive that, with Scott, religion was a real thing; but, though real, it meant a somewhat different thing from the same term when applied to Wesley or to Wilberforce. It is also a different thing from the religious sentiment, often combined with very deep scepticism as to the truth of many theological dogmas, which will probably fifty years hence be noted as a characteristic of the thinkers and writers of 1891.

There is not the least trace of scepticism, in the ordinary sense of the word, in Scott's Journal, nor would a reasonable critic expect to find any trace of that sentiment. There is no reason to suppose that he would not have described himself with perfect honesty as holding the religious convictions of his countrymen. But for all that there is something in Scott's attitude towards theology different from anything we should now find in most writers of the present day. The absence of any systematic scepticism represents one side of the matter. The absence, on the other hand, of any keen interest in theological differences represents another. We have, as we read Scott's writings, to remember that the Anglo-Catholic movement, that the Rationalist movement, that the new development of Romanism, that the different sceptical movements which have marked the last fifty years in England, were subsequent to his time. We must note, also, that the religious expressions—there are not very many of them—which occur in his Journal, though not implying the least unorthodoxy, are, as a matter of fact, those rather of a Deist than of a person much occupied with Christian dogmas.

It is the historical results, moreover, of Christianity on which, to judge from one or two expressions in his Journal, he mainly based such dogmatic creed as he held. It may be suspected that, in religion no less than in politics, the leading men of Scott's time approximated more nearly to one another than they themselves perceived. No doubt many of Scott's Whig friends were sceptics in a sense in which he was not. But modern critics are apt to underrate the positive aspect of the religious convictions really entertained by the greater number of Scott's contemporaries. They most of them, whether Tories or Whigs, looked with coldness and suspicion on enthusiasm. Neither the reminiscences of Puritanism (which, be it remarked, was and is still a power in Scotland), nor the anti-religious fanaticisms of the French Revolution, were likely to commend to the men either of 1800 or of 1832 beliefs based on fervent popular sentiment. But, on the other hand, even the sceptics of the day were—in general, to say the least—convinced Deists, and many men whose want of enthusiasm kept them quite apart from the so-called religious world were firmly convinced that the truth of the leading facts of Christian history was established past a doubt by Paley and other apologists of the same school. An infidel was not only a man of bad principles, but a fool. Lord Abinger will hardly be counted as a religious enthusiast. "I recollect," writes his son, "to have heard him say that, independently of moral conviction, there was sufficient circumstantial evidence of the truths of Christianity to convince any twelve unprejudiced and enlightened jurymen. This was his remarkable legal view of the question." This was the view, sound or unsound, which lay behind the religious opinions of the leading Englishmen of sixty or ninety years back. But these opinions, combined with distrust of enthusiasm, led to that real belief in rational piety which is the true note of the generation of Scott and his associates. With some the piety, with others the rationality, of the creed was the more patent. But it was at bottom a real, genuine creed, differing in ways easier to perceive than to define from the beliefs, sceptical or anti-sceptical, of to-day. No one who reads Scott's diaries with an open eye can deny that it was a creed which, when held by men of fine natures, produced noble results.

FURNESS'S "AS YOU LIKE IT."

As You Like It. [A New Variorum Edition of Shakespeare, edited by Horace Howard Furness. Vol. VIII.] Philadelphia: J. B. Lippincott Co. 1890. Pp. ix, 452.

A PREFACE is generally the part of a book written last, and read last, or not at all. But when a new volume of the 'Variorum Shakespeare' appears, the old student of Shakspere is apt to choose the preface for first reading. Mr. Furness has a way of laying by good things for his preface, and making it an appetizer for the banquet. He begins with an essay on the value and interest of variorum notes over and above verbal explanation and antiquarian information—the penetrating and enlightening thoughts of keen intellects. Reading him here, it seems impossible not to agree with him. Shakspere is not only witty himself, but the cause of wit in others. A Shakspere symposium of Johnson, Coleridge, Hazlitt, Campbell, Christopher North, Mrs. Jameson, Lamb, Mrs. Kemble, Lady Martin, Goethe, Schlegel, George Sand, is "a feast of the gods." One, indeed, to whom literature is a by-play, who turns to Shakspere as to a comic opera to dream away an idle hour, may find all he wishes in rapid and sympathetic reading, or merely receptive hearing and seeing a play of Shakspere, and Mr. Furness says truly that we all have such moods. But this is only an introduction to Shakspere. Even in this vacant mood, pictures sink into the memory which rise again a wonder and a wild delight; expressions which cannot be forgotten suggest new thoughts, new views of life, provoke, startle, baffle us, lead us on to earnest study of the text and the context and everything that has been said about them, and of everything that Shakspere has written and everything that he was.

It is a surprise to find Mr. Furness objecting to the study in the plays of the personal history of Shakspere. That is another of the topics of the preface. He does not believe that either Shakspere's outer or his inner life is to any discoverable degree reflected in his plays. The smallest dash of the author's self would mar the characters. The whole subject of the time and circumstances under which one of the plays was written is one which with him "has absolutely no relation whatsoever to the play itself or the enjoyment thereof." But it is cer-

tain that every thought uttered in these dramas was a thought of Shakspere. Of the myriad facts and judgments which are the elements of the speeches there is no one but was drawn from Shakspere's knowledge or opinions. The words the characters used are Shakspere's; one idiom he brought up from Stratford, another he picked up in London; he caught one from Marlowe, another from Jonson; he made a third. What is a man's inner life? Are a dreamer's dreams no part of it? If one could meet Shakspere, as Jonson did at the Mermaid, and hear him talk till midnight, till morning, in his happiest vein, would that open his inner life? Did the sonnets unlock his heart? Most men's talk is a phonotype of their morning newspaper and evening magazines. The inner self is not spoken out in any phrases, facts are fables agreed upon. And yet the students of character ask triumphantly, How can a man be concealed? Phenomena which are nothings one by one, become data for the reason to apprehend, to compare, to interpret, to comprehend; we can study out the sense of cuneiform inscriptions, of hieroglyphics; no cipher can keep its secret.

It is possible, indeed, to conceive a poet who gets up baffling poems, who, when old, says to himself, Now I will write as a youth, or who stores up his experiences, as Goethe did, till time gives them poetic glamour. But Shakspere was not of this type. He uttered himself freely. Mr. Furness says: "For my part I believe that Shakespeare wrote his plays, like the conscientious player that he was, to fill the theatre and make money for his fellow actors and for himself." But it seems probable that the peculiar Shaksperian qualities were the main attraction of his plays; that he knew that the best play to fill the theatre was the play in which his genius was most manifest, in which he could work most freely and happily, in which his felicities flow through every line. Life is not shown in Shakspere as in a plain mirror. No person ever talked in the rhythm of *Hamlet*, or *Jacques*, or *Rosalind*, any more than in the strains of an opera. There is a miracle of preëstablished harmony between these dreams of beauty and music and the natural world, and there is a mounting spirit in us which proclaims these dreams more real than nature, more true than fact. To dwell content in single plays, as scenes of real life, and care nothing for the laws which govern them, the laws of the Shaksperian world, which are traits of the character of Shakspere, seems exactly parallel to the study of nature as described by Bacon: "While the Minde of Man looketh upon Second Causes Scattered, it may sometimes rest in them and goe no further. But when it beholdeth the Chaine of them Confederate and Linked together, it must needs flie to *Providence*, and *Deitie*." A single speech of *Hamlet* may please us for a time as a gem of thought; reflecting on all his speeches, we frame a character of *Hamlet;* an induction from all the speeches of all the characters in all the plays leads to the inner life of the poet.

Mr. Furness says further, that if we are to infer the experiences of Shakspere from the tone of his dramas, it would be an error to infer that a sad life prompted sad writing. He would surely retreat to an inner world of his own creation where all was fair and serene. And so Mr. Furness suggests that it was possibly from a life over which sorrow and depression brooded that there sprang the jocund comedy of "As You Like It." That "As You Like It" sprang from a sad heart seems true, but no such paradox as Mr. Furness pleases himself with, is needed to explain it. The life is led "under the shade of melancholy boughs," and one does not need *Jacques's* power to suck melancholy out of a song as a weasel sucks eggs, to find it plain in all the merriment.

"Blow, blow, thou winter winde,
Thou art not so unkinde as man's ingratitude."

We feel the winter wind from the first, and there is not a flower in the forest; there are sermons in the stones. The play is a companion piece to "A Midsummer Night's Dream"—a November day dream. We give ourselves up to the enchanter, and encounter the most surprising matters and things without surprise, as we do in our dreams. The old Shaksperian lion is here, as much at home as the deer; here are palm trees, oaks, olive trees. Time and space adjust and readjust themselves to the story, and so do the characters. *Orlando* looks in the eyes of *Rosalind* and talks love, and does not know her. The villains of the play are as good as girls. When we wake from our dream, we recognize that the magician who creates it is the same who created the dream in the wood near Athens, but that he is sadder now and older, and has a commonplace book crammed with thousands of wise saws which flow freely from all his mouthpieces, from *Jacques*, *Touchstone*, *Rosalind*, from philosophers, and fools, and girls.

HOSMER'S ANGLO-SAXON FREEDOM.

A Short History of Anglo-Saxon Freedom: The Polity of the English-Speaking Race outlined in its Inception, Development, Diffusion, and Present Condition. By James K. Hosmer, Professor in Washington University. Charles Scribner's Sons. 1890. Pp. xx, 420.

THE study of institutions is being taken more and more as the proper ground-work of national history. Clearly, it offers the best opportunity for scientific method, while a rich and comparatively new field is thus thrown open to research. As a result, the last few years have produced a large number of treatises, monographic and general, relating to the institutional development of England and the United States. Local constitutional history, in particular, is gaining more definite form; and two or three writers, looking even beyond the nation, have traced the expansion or described the present condition of a Greater England. The work of Prof. Hosmer, however, has the distinction of being the first sustained effort to follow, phase by phase and with some attention to the more salient details, the comparative constitutional history of the English-speaking race, from the "Teutons of Cæsar and Tacitus to the British Empire and the United States of 1890." This is surely a formidable undertaking. To sketch faithfully the polity of a great people in its lower as well as in its higher organism during the vicissitudes of many centuries—a polity, moreover, whose beginnings are so often obscure, and whose present tendencies are thought by many to be almost equally uncertain—requires a firm hand, much self-restraint, and the mastery of a vast number of facts. Prof. Hosmer deserves high praise for the satisfactory way in which he has performed his intricate task; especially since he has been able to present his subject in a form suitable for the general reader.

The author is a believer in the continuity of Germanic institutions. As will be inferred from the title of his book, he regards the present condition of English self-government as in spirit a survival, in some sense a restoration, of the primitive democracy. Anglo-Saxon freedom is most simply and comprehensively stated, he says, in the phrase of Abraham Lincoln, "government of the people, by the people, and for the people." Everywhere, largely under the influence of American experience, the "plain people" of the English race have again come into power; just as, according to the well-known view of Freeman, the elective kingship of early days has been restored. The first two chapters are devoted to the period before the Norman invasion. Here the author has, in the main, accepted the guidance of John Richard Green and Bishop Stubbs. The conquest of England was achieved by Germanic tribes from the shores of the Baltic, bringing with them their customs, their social ranks, and their political institutions. The unit of organization was the tunscipe, whose prototype was perhaps the ancient mark. Above the tun were the hundred and the shire. In the town-meeting, as in the higher moots, the free land-owning ceorl and the noble æ.heling governed themselves. An important innovation, after occupation of the island home, was the establishment of monarchy. Thus, in the beginning, the simple freemen were in possession of the substance of political power. But even then there existed the germs of deterioration. By the middle of the eleventh century, the primitive tribal kingship had been transformed into a territorial monarchy, whose prerogatives were tending towards absolutism; and the rudimentary landed aristocracy of the days of Ine had been replaced by a feudal thegnhood, chiefly through the influence of the Danes.

Prof. Hosmer will undoubtedly be criticised for ignoring, except in his preface, the opposite theory of Frederic Seebohm, that manorial serfdom prevailed from the very beginning of English history. Indeed, it is possible, in the present stage of inquiry, that entire suspension of judgment would be the safer course; still, it should not be forgotten that the author is writing for the general public, and avowedly presenting those views which he believes to be sustained by the weight of authority. While such scholars as Paul Vinogradoff and the late Prof. Allen find it necessary to reject Seebohm's conclusions for the early period, the older and more popular conception of the primitive Anglo-Saxon constitution cannot be regarded as overthrown. On another important question the author is more conservative. He is very reluctant to accept the view that representation in the local moots, through the "reeve and four" of each township, appeared before the Norman conquest. This is the opinion of Bishop Stubbs, who supports it only on the slender evidence of the so-called Laws of Henry I. It is not improbable that the great historian is right in his position; yet until further proofs are brought forward, if such exist, it certainly will be prudent to "proceed here with caution."

The story of the struggle for English liberties from the landing of William to the age of George III. is told in nine chapters. Here the author is perhaps at his best. His style has all the clearness, vigor, and grace with which the readers of his 'Samuel Adams' and 'Young Sir Henry Vane' are familiar. Excellent judgment is shown in the choice of material for each phase of development. The battle of Hastings, Magna Charta and the rise of Parliament, the coming up of the serfs, the times of the Lancastrians, the depression of the power of Parliament under the Tudors, the England of Charles I., the Commonwealth, the Revolution of 1688, and the era of parliamentary corruption are each briefly and graphically presented in a way which cannot fail to hold the attention of the reader. Probably the

best chapter is that in which the remarkable constitutional experiment of the Commonwealth is discussed. There are two merits in this book rarely met with in a popular survey. Some of the descriptions are enlivened by a local coloring, a precise attention to details, which can only be attained by one who has carefully and sympathetically examined the topography with his own eyes. Again, the author often reveals a firm grasp upon the sources. Documents are subjected to independent analysis; and many a quaint phrase shows that he has written with the ancient chronicle before him.

A very interesting account is given of the rise and development of local organisms on American soil. In Virginia, English society of the seventeenth century was most faithfully reproduced. The county was the unit of administration. At its head was the Court of Quarter Sessions, composed of justices appointed by the Governor. Below the county was the parish, controlled, as in the mother country, by a select vestry, a close corporation. This aristocratic and centralized type of local government became the model for the other colonies of the South. In New England, on the other hand, important modifications were made in the system with which the Pilgrims and Puritans had been familiar in the old home. The continuity of English institutions is unbroken; yet in the higher as well as in the lower sphere of political life there is a revival of the fuller liberty and the more democratic methods of earlier days. There is no conscious retrogression. Nevertheless, as Freeman has well said, "the New England town-meeting is the moot of the Anglo-Saxon tun resuscitated with hardly a circumstance of difference." The Pilgrims, declares the author, "did not reproduce the state of things they had left behind; nor, on the other hand, did they invent something new." They were true conservatives, "for, in the society which they set up, they went back to old ways which in England itself had been largely forsaken." When left to themselves, it was natural that the pioneers, "following tendencies which had come down in their blood, should adopt and at the same time strengthen what remained of the ancient features of Anglo-Saxon freedom." Prof. Hosmer thoroughly appreciates the importance of the New England town; but the colonial shire, especially that of Massachusetts, deserves much more serious attention than he has given it.

It is curious to see how entirely the various forms of local self-government now existing in the Western States have grown out of the early institutions of New York and Pennsylvania. By an act of 1703 (not 1705), reviving an earlier statute, there was created for each county in New York a fiscal board, composed of the township supervisors. This became the direct model for that higher type of township-county organization first carried into Michigan, and thence into Illinois, Wisconsin, and Nebraska. In the board of supervisors of the Western county, as in the newly created councils of the English shires, may be seen again in principle a revival of the ancient shire-moot composed of township representatives; and the author seems, on the whole, to favor the view that this plan of local government is the most efficient and evenly balanced which has yet appeared.

Not less interesting has been the influence of Pennsylvania. From her has come the lower type of township-county organization which, after the passage of the Ordinance of 1787, first found its way into Ohio and eventually into Indiana, Iowa, Kansas, and Missouri. Here there is no popular moot, or else it exists in a rudimentary form; and the township sends no representatives to the county board. But this is not the only feature of the local constitution which the West owes to Pennsylvania. It was in that province, during the early half of the eighteenth century, that the first real experiment in republican county government was tried. Yet nearly all writers have strangely overlooked the fact that, not directly from Virginia, but from Pennsylvania, is derived the independent county-precinct plan now existing in the majority of Western States, and whose marks are an administrative board of three or more commissioners and the choice of all officers by popular ballot. The author has referred (pp. 127, 286, 293) to this important fact in general terms. He should have discussed it with more precision, and given it prominence in his chapter on the present condition of American polity. It is this republican type which is now gradually being adopted throughout the South and Southwest.

There is much of interest in this work which can here receive but passing notice. Such is the chapter on the causes of the American Revolution, containing a good account of the inconsistencies in which the King and colonists became involved with respect to the legislative powers of Parliament; the chapter on the Revolution itself, where the fact is clearly brought out that the contest was "a struggle of parties, not countries," and the result a "victory of the popular party on both sides of the Atlantic"; the discussion of the Federal Constitution, which is described as "merely a modified version of what stood in England between 1760 and 1787," though gaining a new significance from its written or "rigid" form; and the account of the progress of federation and civil liberty in the new colonial empire of Great Britain.

In the last three chapters an attempt is made to forecast the future of Anglo-Saxon freedom. The author is very hopeful. It would perhaps be wrong to say that he has underrated the capability of other peoples for self-government, or that he has overestimated our own. Still, one cannot help thinking that a somewhat more cautious, less dogmatic, mode of treatment would have been better. There is danger of fostering the habit of self-glorification. It would be misleading, however, to insist very strongly on this criticism, for the embarrassments which beset popular government in both England and the United States are carefully pointed out. Attention is called to the conspicuous failure of our municipal administration; to the troubles growing out of our wretched civil service, our overgrown corporations, and the unsatisfactory relations between labor and capital. Moreover, the author has fortified even his most extreme judgments with an array of contemporary opinion which constitutes one of the peculiar features of his book. After all, who will deny his conclusions, that capacity for self-government is the especial gift of the Anglo-Saxon, who has in consequence already achieved the leadership of the world? that this leadership may hereafter be imperilled, particularly by the vast expansion of Russia and the awakening energy of China? or that humanity is deeply concerned in a closer fraternity, a general federation, of the English-speaking race? On the whole, we are indebted to Prof. Hosmer for a sound and very interesting contribution to the history of politics.

Further Records, 1848-1883: A Series of Letters by Frances Anne Kemble, forming a sequel to 'Records of a Girlhood' and 'Records of Later Life.' With a portrait of Mrs. Charles Kemble. Henry Holt & Co. 1891.

THE vivacity of Fanny Kemble's pen is well known from her memoirs, and it does not grow tame with years. The subjects upon which she exercises her faculty of writing simple, gossipy letters in the present volume are more monotonous than in the previous two volumes, but the life of the writer is infused even into the details of housekeeping and the annoyances of age, and what she says is often readable when it is not perhaps profitable. The present series of letters is principally from the year 1874, when she was settled in Philadelphia, to 1877, when she returned to England, and is concerned with domestic particulars. Towards the end of the volume are some letters of travel in Switzerland, the Tyrol, and Italy, and a separate batch dating from 1848 to 1883. The text is frequently interrupted by bracketed passages in which reminiscences of some person mentioned are set down; and these are the more important parts. The collection, however, adds very little to our knowledge of the writer or to her anecdotes of the past. There are occasionally passages which good taste would have excised; but the absence of proper editing is the most noticeable defect of the work.

Life in America is naturally the chief topic; and especially the trials of household service, the degradation of politics, the expense of living and the extravagance of people of wealth, and the insupportably hot weather are the subjects that afford the bulk of the matter, if we except family news. This judgment upon American women is a sample of what Mrs. Kemble has to say of her own sex in this country in more than one place:

"The men and women of the United States are upon the whole the least animal race of human beings that I have ever seen. The men have no backs to their heads, and the women no backs to their bodies, and their animal nature appears to me weaker than that of either English, French, Italian, or German people. The affections have their root in the animal propensities, though they exist of course in measure where these are not strong. The Americans love their children, I should say, more morally and intellectually than physically, which is the reverse of all coarse and powerfully animal natures. The American women do not care to have children, and have, I think (compared with women of other nations), little baby and little nursery love; for all which their general infirm health and terrible climate and miserable lack of domestic assistance for the proper care of their children (rendering the period of their infancy one of absolute slavery to the mothers) would be reasons enough."

The men, too, she says, are a less robust and a subtler race than the English.

Of social or biographical matter we find very little. There is one interesting passage upon the lack of society in Boston which is worth quoting. Mrs. Kemble has just been speaking of the group of educated and talented men who made the Boston of her day famous, and in whose circle she was always a welcome guest, and she continues:

"With such material for the most charming and brilliant society, it has often been a subject of curious surprise to me that Boston had nothing that could be called so, nothing comparable to that finest product of mature civilization, the frequent easy and delightful intercourse of highly cultivated and intelligent men and women. They were all intimate or friendly acquaintances with each other; their wives, sisters, and daughters were in almost daily intercourse; and yet there was nothing that could be called society, in the true sense of that word, in the Boston of my day. . . . Three reasons may have tended to this result: the

men worked too hard in their business abroad, the women were too hard-worked in their duties at home; and I think the New Englanders inherited from the old ones the want of both taste and talent for society, and from their Puritan ancestors a decided disinclination and incapacity for amusement in general—for amusing others and being amused themselves."

Of this group of men we get very few glimpses in this volume, except the very sympathetic account of Longfellow's dinner and tribute to her when she read in the city, and of his affectionate regard for her in later life. Englishmen appear as little on the pages. There is a kinder characterization of Charles Greville than he appears to have deserved, and a pleasant account of Lord Houghton and of a visit with him to Tennyson; but hardly anything else. The letters of foreign travel are not especially entertaining. Altogether, were it not for the womanly charm and good sense and entire naturalness of Mrs. Kemble, the collection would be described as containing the lees of life; but her own vitality makes the volume unusually interesting, and one is surprised at the end to see how much he has been entertained by the merest trifles of correspondence which hardly ever ceases to be domestic.

Picturesque India. By W. S. Caine. Geo. Routledge & Sons. 1890.

THIS pleasant guide-book easily carries one back to far-off India, and revives the memory of one's visit to that wonderful country, with its crowded cities where the Europeans land—Bombay, Madras, and Calcutta; the rolling highlands of the south, the sunny plains of the north, and the grand mountains beyond—each with its teeming populations, its architectures and its religions, the whole uniting in a marvel of complexity which few persons really understand. In a country characterized by the poverty of millions and the great wealth of the tyrannical few, it is natural that the great buildings should receive more attention than anything else. This is the case with Mr. Caine's book, and nearly every traveller has the same experience. The unnumbered poor live in hovels that attract only the self-forgetful sociologist; the little country villages are passed by unnoticed between the great cities. The native merchants are often well off, but their customs are so far removed from those of Europeans that the traveller seldom learns much from their poor English. The Anglo-Indians, whether as members of the Government or of the army, or as merchants, remain foreigners, too often out of sympathy with the people around them. The missionaries enter further into the life of the natives, and from these, as from the educated Hindus whom one may come to know if he makes the effort, something of native life may be learned. Few travellers go so far as this; they hurry from city to city, stop at the English clubs or hotels, look at the great buildings, temples, and tombs, and have no time for anything else. But even such a glimpse is a grand entertainment. What can excite greater interest than the history suggested by the caves and rock temples about Bombay, the mosques of Lahore and the other Mohammedan cities of the northwest, the tombs at Agra and old Delhi on the river plains, and the Hindu architecture from Benares southward? Yet it is the history of rulers, not of the people. Curiously, in all this, the only emphatic impression of English origin is in the sanitary settlements on the foot-hills of the Himalaya and on the southern plateau; there is now even a narrow-gauge railway up to Darjiling, with loops and switch-backs, climbing from the plains up to a height of more than seven thousand feet above the sea.

Mr. Caine tells of all these things in a very straightforward and entertaining manner, giving a simple recital of what may be seen at place after place. The book is something between a guide and a traveller's narrative. It is not compact or statistical enough for a guide of the most convenient kind; it gives too much description, and sometimes even suggests the appropriate emotions, as in quoting Sir Edwin Arnold's account of the Taj. Such superlatives should never be read before going to a place; they may be read on the spot, or afterwards at home, but not beforehand if one would have his own enjoyment and not some one else's. The illustrations are numerous and well drawn, chiefly from photographs, of which the traveller finds a most attractive assortment in India. The suggestions in preparation for travel in India are valuable, chiefly from their simplicity and from the emphasis they give to the importance of letters of introduction. From this last we may appreciate what Rudyard Kipling tells in one of his stories—how the hospitality of the Anglo-Indians is being dulled by the number of passing globe-trotters who bring introductions with them, and thus, as it were, demand entertainment. The letters may be given more cautiously after this note of warning, but the travellers will continue to increase in number, for it is only a little way now—half round the world—to India. The traveller who can run to Alaska in the summer may easily spend part of the next winter in India. He must not stop on the way, and he cannot see all of the vast peninsula in one visit, but if an entire change of programme is desired after having seen this country and Europe, he should try India.

Electricity in Daily Life: A Popular Account of the Applications of Electricity to Everyday Uses. By Cyrus F. Brackett and Others. Charles Scribner's Sons. 1890.

THIS very handsome and richly illustrated volume is made up of ten separate essays upon as many different electrical subjects and by as many different authors. The essays originally appeared in *Scribner's Magazine*, and it is of no small interest to note the prominence of what is almost purely scientific writing in such a periodical. Books of similar purport, though less elaborate, are not uncommon in our language, and one of them we have already noticed. The essays, of course, vary much in ability, but all are fairly good, while the wood-cut illustrations are very fine; the portraits given are at least tolerable. Though the essays are, of course, intended for non-professional readers, they still contain a great deal which even an expert will read with pleasure and profit.

The historical parts of the work are often open to objection. We think that Mr. Buckingham, in "The Telegraph of To-day," has done scant justice to the late Prof. Henry, and that he has failed to see, or at least to state, in what Morse's real merit consisted. There were electric telegraphs before that of Morse, as there were steamboats before the *Clermont* of Fulton; but whether the electric telegraph was an original conception with him or not, this much is certain, that Morse grasped the subject with a perfectly clear view of the end to be attained, and, at least in a general way, of the means of attaining it; and that he finally did attain the end, and, under the greatest difficulties and discouragements, made the telegraph a practical success. That is honor enough for one man. Fulton's case was precisely similar.

We can cordially recommend the collection of essays which form this volume as agreeable, instructive, and suggestive reading.

Petrarch: A Sketch of His Life and Works. By May Alden Ward. Boston: Roberts Bros. 1891.

THE author of this volume, who has previously written acceptably upon Dante, derives the material of her portrait mainly from the letters of Petrarch, and her conception of his place in history from Mr. Symonds. There is very little criticism of Petrarch's works or illustrations of his life from his poems: the volume is thus no more than a biographical sketch of the man himself. His birth and childhood, his various wanderings, his studious solitude, relieved by his mingling with the courts of the time, his coronation at Rome, his friendship with Rienzi and also with the Visconti, his sojourn at Venice, his love of fame and of manuscripts, and his habit of letter-writing, are all duly dwelt upon, with a view to exhibit the singular contradictions of his character, his great place in the world of his time, and those qualities by virtue of which he is named "the first modern man." Of the poetic side of his genius, of the traditional lover of Laura, we hear very little, and the author has most successfully avoided in her characterization all that might tend to make of Petrarch a sentimentally idealized figure such as he is usually conceived. As her aim has been to set forth the man, it must be conceded that she has done so without any sparing of his weaknesses, the contradictions in his nature, the disconcerting incidents of his career; but she shows the great amiableness that distinguished him, the love and veneration which he won, and the independence of thought and action, especially in political affairs, which were most honorable to him. Yet, after all, one misses the poet from the volume, much as if one should miss the orator in a life of Cicero drawn mainly from his familiar letters. The volume fills a place among popular and not too learned books about great literature, and is to be recommended as entirely sufficient to its modest aim.

Architectural Studies in France. By the Rev. J. L. Petit, M.A., F.S.A. With illustrations from drawings by the author and P. Delamotte. New edition, revised by Edward Bell, M.A., F.S.A. London: George Bell & Sons; New York: Scribner & Welford. 1890.

MR. BELL'S editorship of this new edition of Petit's 'Architectural Studies in France' is confined to adding a new index, which was desirable, and a few notes, and to rearranging the cuts. There was no reason to alter the text; the discussions, though in great part superseded by the progress of knowledge and the changes in the tendency of architecture since they were written, are not without present interest. Mr. Petit had a fair knowledge of architecture, an artistic instinct, a quick eye, and a clear judgment, and the notes and illustrations of his zigzag tours remain a useful guide through the most interesting of the French provinces, unsuperseded inasmuch as architectural study has drifted into other regions; and any one may still do good service who will follow out their indications, and fill up the important parts of Petit's outline by the help of the camera and modern reproductive processes.

Those who know the original work will re-

member that it is lavishly illustrated with anastatic lithographs of Petit's own pen sketches, and by cuts from drawings by Delamotte. The processes used in reproducing here the old illustrations have not dealt very kindly with them. Those from Petit's pen drawings are mostly reduced, with much advantage to the compactness of the volume, and with little harm to the rather rude originals. Three, by the way, which are classed with these in the descriptive list, are surely from another hand than his, and a more skilful one (pp. 146, 153, 299). The cuts have not fared so well. Some, in which the original blocks may have been used, are satisfactorily given, but most are either badly processed or printed from blocks that are worn and clogged, so that they misrepresent the originals. But the paper and letter-press are good, and the illustrations, if they have lost much of their charm, are still instructive. The student of architecture can afford to be grateful for the republication, though whether Mr. Petit and Mr. Delamotte would be as much so is more questionable.

The Eclogues of Calpurnius. Rendered into English Verse by Edward J. L. Scott. London: George Bell & Sons. 1890.

PASTORAL poetry in the purely literary type known as the Eclogue has never become domesticated in English. Even in Latin, Vergil's Bucolics owe their place in literature to their matchless grace and mastery of language and metre, and not to their matter, which was apparently exhausted by the pioneer in the type, Theocritus. As for the Eclogues of Calpurnius, the copy of a copy, "shadow of a shade," nobody ever thinks of reading them save those whose business it is to go down into the deeps of hexameter construction. One is, therefore, rather at a loss to see why Mr. Scott has felt it worth while to translate them into English verse, in spite of his statement that they have never before appeared in English. The metre which he has selected is hardly a happy choice. As Gay said in his proem to the "Shepherd's Week," the language of the swains and shepherdesses of bucolic poetry was "not only such as in the present times is not uttered, but was never uttered in times past, and, if I judge aright, will never be uttered in times future." They spoke an altogether artificial dialect, as of courtiers playing at being rustic. They were not the natural country folk of what Mr. Lowell calls the

> "days endeared to every Muse,
> When nobody had any Views."

And to put their sham simplicity into this same delightfully confidential verse, as Mr. Scott has done, instead of into the consecrated heroic couplet, is surely an error of taste.

But there is no such fault to be found with the translation itself. Besides being admirably faithful, its language is exactly suited to the literary type, having (to quote Gay again) "too much of the country to be fit for the court; too much of the court to be fit for the country." This was just what the ancient bucolic poets succeeded in producing; this is what Mr. Scott has reproduced.

The Industrial History of England. By H. de B. Gibbins. London: Methuen & Co. 1890. Pp. viii, 232. 8vo.

THIS is the first volume of the "University Extension Series," edited by J. E. Symes, which will comprise books on historical, literary, and economic subjects, suitable for extension students and home-reading circles.

"The volumes are intended to assist the lecturer, and not to usurp his place. Each volume will be complete in itself, and the subjects will be treated by competent writers in a broad and philosophic spirit—in the spirit of the movement they are designed to assist. They will, it is hoped, be acceptable to those who have not time to study in detail the large subjects treated of, but who desire to get a general knowledge of the conclusions arrived at by specialists."

This statement regarding the scope of the series conveys some idea of the general character of Mr. Gibbins's little book. It is not a work of original research, but gives, in a clear, concise, and simple form, the main points in England's economic and industrial history; it gives a "general view of the broad outlines of the growth of our wealth and industry in their relation to the general history of England." The scope of the work is not well indicated by its title. England's commerce and agriculture receive almost as much attention as her industry.

In dealing with so large a subject, it is almost impossible to write a popular treatise free from errors. Mr. Gibbins errs in identifying the manor with the township (pp. 7, 22); he also fails to grasp the distinction between a manor and a borough (pp. 22, 23). Names of places ending in *ing* can scarcely be called relics of the mark system (p. 7); nor does the name *Tucking Mill* afford striking evidence of the settlement of the Flemings in England (p. 37). The Domesday Survey was not made in 1089 (p. 16). The *firma burgi* was not a "composition for taxation," the payment of a fixed sum of money in lieu of tallages, etc. (p. 25); most English writers persist in giving this erroneous definition of *firma burgi*, although there are numerous documents in print which show clearly what the term really meant. It is also a mistake to assert that all the towns had secured the *firma burgi* by the end of the Norman period (p. 25). Some of the author's assertions regarding the gilds are very doubtful, especially his statements, on pp. 27, 28, that the gild feast was held once a month, that the merchant gilds "existed certainly in Edward the Confessor's time," that the old village gild feasts are probably represented to this day in the parish feasts, and that the gilds bought up the *firma burgi* of their respective towns. For "Maxtead" (p. 58) read "Thaxtead."

As a rule, however, Mr. Gibbins is accurate, and has evidently made careful use of the best authorities on his subject. His clearness of style is also notable. His book likewise contains some excellent maps. It may be recommended without hesitation to those who desire a good concise account of the economic history of England.

Die Spectralanalyse der Gestirne. Von Dr. J. Scheiner. Mit einem Vorworte von Prof. H. C. Vogel. Leipzig: Engelmann. 1890.

THIS book belongs to that limited class of scientific works whose very excellence blunts the interest of a detailed review. Devoid of nonsense and devoted entirely to setting forth what is known, what remains to be discovered, and how to proceed in mastering that remainder, the task of the reviewer is limited to showing what the book is and what want it fulfils. We learn from the preface that the late Dr. Engelmann, in whose person the professions of astronomer and publisher were happily united, conceived the idea of a thorough treatise on "astrophysics," showing fully the present state of the science. The present work is a partial embodiment of that idea, embracing, with all necessary detail, the subject of celestial spectroscopy. In the first part the instruments and methods of research are described with all necessary completeness. In the second the two leading principles of spectroscopy are developed, and here, perhaps, the American and English student will find most that is new and useful. It is often said that an incandescent gas is characterized by bright lines in its spectrum, but we learn the fact, which has been long known though half forgotten, that this is true only under two conditions, viz.: that the gas is transparent through and through, and has within it no solid matter as hot as the gas itself.

The results of spectrum analysis are set forth in the third and concluding part. As an example of the author's method we may instance his dealing with the spectrum of the zodiacal light. In three pages he describes the spectrum as seen by four observers, giving more than half his space to the results reached by the best-situated observer, Prof. A. W. Wright of New Haven. Six figures of spectra show to the eye that the spectrum is identical with that of reflected sunlight.

What renders the work especially valuable to students and investigators is, in the first two parts, the completeness with which physical principles are applied to methods of research; and, in the third part, the condensation of the latest results reached by observers everywhere. We therefore hope that it will speedily be made more accessible to American students by an English translation.

Woman's Work in America.

Edited by ANNIE NATHAN MEYER. Introduction by JULIA WARD HOWE. 12mo, $1.50.

Contents: Woman in Education. (a) In the East, Mary F. Eastman. (b) In the West, May Wright Sewall. (c) In the South, Christine Ladd Franklin.—In Literature, Helen Gray Cone.—In Journalism, Susan E. Dickinson.—In Medicine, Dr. Mary Putnam Jacobi.—In Ministry, Rev. Ada C. Bowles.—In the State, Mary A. Livermore.—In Law, Ada M. Rittenbender.—In Industry, Alice Hyneman Rhine.—In Philanthropy. (a) Care of Poor, Josephine Shaw Lowell. (b) Care of Sick, Edna D. Cheney. (c) Care of Criminals, Susan Barney. (d) Care of Indians, A. B. Quinton. (e) Work of the W. C. T. U., Frances Willard. (f) Work of the Red Cross, Clara Barton. (g) Anti-Slavery Movement, Lilie B. Chace Wyman.

Fanny Kemble's Further Records.

Forming a sequel to Records of a Girlhood and Records of Later Life. 12mo. With a portrait of Mrs. Charles Kemble. $2.

Taine's 'Modern Regime.'

By H. A. TAINE. Translated by JOHN DURAND. Vol. 1. (To be completed in two vols.) 12mo. $2.50.

HENRY HOLT & CO., New York

GENERAL SHERMAN'S

MEMOIRS WRITTEN BY HIMSELF.

The *only* book written by the General, and the *only* one in which his family are in any way interested.

New Edition, Complete in One Volume, $2.00.

This edition, beautifully bound and printed, brings the great book within the reach of all. None are too poor to own it.

An additional chapter has been written, bringing the story of the General's life down to date, describing the closing scenes and the vast demonstration that attended the burial. Revised and corrected by

HON. JAMES G. BLAINE,

who also contributes a personal tribute to the General and a critique of the Memoirs.

FOR SALE EVERYWHERE.

CANVASSERS WANTED IN EVERY G. A. R. POST IN THE U. S.

Sent, postpaid, on receipt of price.

One Volume complete, nearly 1,000 pages, $2.00.

SPECIAL.—We have a two-volume edition of this work for $5.00, beautifully gotten up, uniform with the Memoirs of Grant, Sheridan, McClellan, and other celebrated war volumes. These books can be secured on easy payments by subscribing for our Great War Library in ten volumes. Particulars on application.

Dyspepsia

HORSFORD'S ACID PHOSPHATE.

In dyspepsia the stomach fails to assimilate the food. The Acid Phosphate assists the weakened stomach, making the process of digestion natural and easy.

Dr. R. S. MCCOMB, Philadelphia, says: "Used it in nervous dyspepsia, with success."

Dr. W. S. LEONARD, Hinsdale, N. H., says: "The best remedy for dyspepsia that has ever come under my notice."

Dr. T. H. ANDREWS, Jefferson Medical College, Philadelphia, says: "A wonderful remedy, which gave me most gratifying results in the worst forms of dyspepsia."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION: Be sure the word "Horsford's" is printed on the label. All others are spurious. Never sold in bulk.

De POTTER'S

Tours to Europe.

TWELFTH YEAR.

Advantages and Satisfaction Unequalled.

ROBERTS BROTHERS, BOSTON.

THE DEFENSE OF CHARLESTON HARBOR

(JOHNSON).

SECOND EDITION.

This standard work, military, naval, and historical, has called forth the encomiums of the highest authorities for its accuracy, impartiality, and attractiveness. The author tells how Charleston was rendered impregnable by land and sea for four years.

The *Athenæum* says: "This most important military work, so interesting to military readers that we name it, although it is not much in the way of the *Athenæum*, is a beautifully printed and got-up book, full of portraits and also of technical military plates."

The work in one volume, 8vo, cloth $4.00, half russia $5.00, may be obtained through

ALEX. CAMPBELL, Agent,
52 Broadway, Room 92, New York,

or it may be ordered of

T. PINCKNEY LOWNDES, Charleston, S. C.,

and will be sent prepaid for cash.

The Nation.

NEW YORK, THURSDAY, MARCH 12, 1891.

The Week.

WHAT the Fifty-first Congress has done can be stated in a few words: It has passed the most reckless and indefensible pension bill ever put on the statute-book, together with private pension bills by hundreds, and has thereby put in train a probable deficit in the Treasury during the coming year. Such a deficit can be met only by issuing bonds or imposing new taxes. It has passed the most reckless and indefensible tariff bill ever known in our history, and has embodied in it a new principle more vicious and unrepublican than the tariff itself, viz., that of bounties for the production of a particular article of commerce. It has increased the purchase of silver bullion from $2,000,000 to $4,500,000 per month, and by so doing has exposed us to the danger of a change in the common standard of value from gold to silver. If the same firmness in resisting the demands of the silver-mine owners had been shown last June that was shown in February, the country would have been spared this danger and this drain on its resources. It has brought into the Union, before their time, six new States, with twelve Senators, in order to keep the Republican party in power after it had lost the numerical majority in the country. It has passed a Postal Subsidy Bill of which it may fairly be said that no such bill was necessary in order to get the foreign mails carried. It has introduced the new principle in legislative procedure that if a quorum of the House does not respond to the roll-call, the Speaker may count one by eyesight, and transact business on the presumption that his eyesight is good. This practice, it is safe to predict, will expire with the Congress in which it originated. The only good things to be set down to the credit of this Congress are the passage of a Copyright Bill, badly crippled, indeed, but better than nothing, and a bill for the relief of the Supreme Court. Credit must be allowed for a vast deal of mischief not done, and particularly for the defeat of the Force Bill. This was a case where one bad measure killed another. The Free-Coinage Bill killed the Force Bill, and the Force Bill helped to kill the Free-Coinage Bill.

The Copyright Bill recognizes for the first time the property of a foreign author in his books sold or printed in this country. It puts an end to the Algerine system of fostering the national intelligence. It enables a foreign author to fix the price of his own wares, instead of having to accept whatever the bounty of the American pirate chooses to award him. But if we said that it was a measure to be proud of, we should be going far beyond the truth. The obligation under which it places the foreign author to have his book "manufactured" in this country, as a condition of protection for it, is a piece of tariff barbarism which is enough to make one hang one's head. It is no more respectable than an act obliging foreigners on landing here to provide themselves with a suit of American-made clothes in order to entitle them to the services of the police or to access to our courts of justice. To put any condition on a man's right to the protection of the law for his person or property, beyond honesty and peaceable behavior, is unworthy of a civilized government, at the close of the nineteenth century. The next generation, we venture to predict, will, for this reason, be heartily ashamed of our first international copyright act.

The members of the Copyright League, and especially Mr. George Haven Putnam, Mr. Gilder of the *Century Magazine*, and Mr. R. U. Johnson of the same periodical, are fully entitled to all the praise and congratulations which are being showered on them for their share in bringing about the passage of the Copyright Bill. Mr. Johnson in particular bore the brunt of the struggle at Washington during the late weary weeks of alternating hope and despair. Many of his experiences in that period must have resembled those of a shipwrecked man on a raft, who every day sees sails bear down on him and then disappear without noticing him. The condition of the Congressional mind on the copyright question, too, has been for months one of the greatest mysteries in psychology. Members who were supposed to be firmly rooted in their support of the bill would often be found over night, or after a short absence from the Capitol, quite alienated from it and greatly cooled towards it, and the work of conversion would have to be gone over again. Or some clergyman or moralist would start up in some part of the country and announce his belief that books were things which God Almighty meant to be stolen, and that the failure to except them by name in the Ten Commandments was a mere oversight. Or some Western newspaper would reveal some hidden villany at the bottom of the bill on the part of the pampered nobles who write books and carry on the publishing business in England, and on this the knees of some friend of the bill would begin to shake, and would have to be hand-rubbed with more embrocation. Never was a bill which had no "money in it" pushed under greater disadvantages. That it should, too, have been extracted from probably the most venal and unscrupulous Congress that has ever met in Washington, the one most indifferent to moral considerations, adds of course greatly to the glory of the exploit.

We have heard a great deal about the last Congress as "a business body." Of all business which a legislative body can transact, none could be more delicate than a radical change in the judicial system. The last Congress made such a change by its act constituting nine new circuit courts, and the *Sun* draws a picture of the curious hodge-podge made of the matter by the two branches, which would be incredible if it were not based upon the official record. It appears that the act as passed on the 28th of February provided that the new courts created by its terms should begin operations on January 12, 1891, and made no provision for the cases now pending in the Supreme Court, while definitely repealing the statute on which the present jurisdiction of that tribunal rests. This "practically swept from the docket of that tribunal its entire calendar, leaving it without any civil cases to try, and providing no new tribunal for the cases that were thus summarily disposed of." Happily this aggregation of blunders was discovered before Congress expired, and a joint resolution was rushed through which provides that the new Circuit Courts of Appeal shall organize on the third Tuesday in June, 1891; or if through any casualty they fail to meet on June 16, then on a day subsequent to be fixed by the Chief Justice or any Justice of the Supreme Court; and that nothing in the new law shall impair the jurisdiction of the Supreme Court or Circuit Courts in cases now pending or reaching the docket before the first of next July.

A Washington correspondent makes an interesting contribution to the history of the defeat of the Force Bill, giving the chief credit for the result to Mr. Ingalls. The Kansas Senator was asked to follow the example of Reed in the House, and push the measure through the Senate by brute power, refusing, at a given signal, to recognize any Democratic member who sought to oppose such revolutionary proceedings, and declaring it passed as soon as the Republicans had answered to the roll-call. His party colleagues expected him to comply with the request, but Mr. Ingalls peremptorily refused. Moreover, he declared that he would defeat the plot if the conspirators should find a tool ready to attempt it. But for his firm stand the project would have been carried through, and its failure is therefore due to him. It was a great service to the cause of good government, the value of which is not impaired even if one feels constrained to question whether Mr. Ingalls might not have taken a different view of the situation if the Kansas Legislature which was to elect a Senator had been controlled by bloody-shirt Republicans instead of by the Farmers' Alliance.

There are already eight States which have adopted ballot-reform laws this year, making the total number of such laws to date twenty-one. The new-comers are Washington, North and South Dakota, Nebraska, Oregon, West Virginia, Arkansas, and Vermont. These are all desirable and thoroughgoing

applications of the Australian system, the greater number of them being modelled closely upon the Massachusetts law. In fact, the only bitter hostility which is shown to the reform anywhere now is that led by the Boutelle Republican faction in Maine and the Chandler Republican faction in New Hampshire. In the former State the fight is very close, and the outlook for the passage of a very excellent measure, which is pending, is extremely doubtful. In New Hampshire a very good bill has been reported from committee, but, while the Democratic members are all in favor of it, the Republican Machine leaders are against it, and are determined to kill it. The motives of these leaders are the same as those which actuate their fellows in Maine. They believe that an honest, because secret, ballot will so cut down the Republican vote as to give the Democrats control of the State.

"In Kansas and Nebraska a mortgage falls due every ten minutes," writes a correspondent of the *Evening Post* from the latter State. He adds that in every such case renewal of the loan can be obtained only by the mortgageor signing a note or bond payable "in gold coin of the United States, of the present standard of weight and fineness, or the equivalent thereof." The attention of the borrower is called to this clause in every instance. If he does not agree to it he is, of course, at liberty to pay now, and paying now means paying gold value. Usually the mortgageor makes a wry face and tries to borrow somewhere else, but there is nobody so green as to lend gold value to-day with the prospect of being repaid in silver at 20 per cent. or 30 per cent. or some other per cent. discount when the loan falls due, with interest meanwhile at a like depreciation. So the new note is signed and the mortgageor goes home with some new ideas in his head on the money question. If the mortgage companies had taken this precaution in the beginning, and if they had, during the past fifteen years, made the same requirement of gold payment that lenders on railroad mortgages have made, there would be no silver craze in the West to-day. We observe that the bills to prohibit the making of gold contracts in Kansas and Nebraska are not making rapid progress in the Legislatures of those States.

The settlement of the controversy over the Fayerweather will is cause for hearty congratulation. The agreement reached will result in the ultimate distribution of nearly four million dollars among educational institutions, and about half-a-million more to hospitals. More than thirty colleges, seminaries, and schools are in the list of beneficiaries, and while no two persons would agree in compiling a list of that length, every candid man must admit that remarkably good judgment was shown in the selection of institutions and in the apportionment of money among them. No such wide distribution of money for educational purposes has ever been made by a rich man, and it is a noteworthy feature of the case that these gifts came in the nature of surprises to the institutions, as Mr. Fayerweather's intention was not known. Altogether the disposition of the estate is one of the most remarkable manifestations of broad and wise benevolence ever known.

The Canadian elections have resulted in a practical defeat of Sir John Macdonald and the Conservative party. Although they have secured a numerical majority, they have met very serious losses. This result does not, we think, betoken any near approach to Annexation, but it does betoken the early breakdown of protectionism in the Dominion. This baleful system is doomed to overthrow on the whole American continent. Sir John and his Government were and are the representatives of the system which taxes the many for the benefit of the few. They raised the cry of Annexation to frighten the timid, just as the protectionists in our last Presidential campaign raised the cry of Rebel Brigadiers. But the people were not alarmed by the spectacle of the small pattern of the "bloody shirt" which was waved so vigorously in the Northern breeze. They evidently believed that Canada could take care of herself, in a political sense, just as well without a protective tariff as with it. The pretence put forward by Sir John that the Dominion would lose the power of self-control under reciprocity with the United States has been decidedly rebuked. The contest has attracted little attention on this side of the line—much less, indeed, than in England—but the result will be satisfactory as showing that the trend of ideas in reference to that venerable fraud and gigantic humbug called protection is the same in Canada as in the United States.

Mr. Stansfeld's motion in favor of the "one-man-one-vote" plank in the Radical platform, supported by Mr. Gladstone, was defeated, owing to the abstention or absence of the Irish members, by a heavy majority in the House of Commons last week, but his object was doubtless fully achieved by bringing the matter before the public through a debate. There is probably no purely domestic question on which the mass of Radical voters are so sensitive. As the law now stands, a man can vote in as many different constituencies as he has houses or lodgings. In this country, where elections are held in all constituencies on the same day, this would do him no good. But in England a properly qualified voter can travel about and vote in several. This, of course, often gives a well-to-do man three or four votes to the poor man's one. It is almost the only anomaly which has come down from the old days of restricted suffrage and rotten boroughs, and the Radicals, of course, seriously resent it. The Tories, however, cling to it, as increasing the political weight of property, but they do not in these days, when they are trying to "dish the Radicals" by pretending to be more radical than they, like to own it. So they did not venture to meet Mr. Gladstone's proposal openly. They turned his flank, as it were, by proposing representation based on population — "the equal numerical divisions" scheme of the Radicals, which they secretly loathe, but which is for the moment a good card, as it would reduce the Irish representation in the House of Commons by eighteen, and would therefore be unpalatable to the Liberals.

A conference on "the organization of industry" was held at Oxford (England) on the 29th of November, the report of which has just been printed and now lies before us. As such men as Mr. Leonard Courtney and Mr. Arthur Acland, two prominent members of Parliament; Mr. Tod, a leading director of the London Dock Companies, and the now celebrated Tom Mann, the leading English labor agitator, were among the members, we read the report with the expectation of lighting on some important contribution to the discussion of the labor problem. Tom Mann spoke his full mind on behalf of labor, and Mr. Tod his full mind on behalf of capital. Sympathizers with labor, who had been backing up the dockers and others in their strikes, spoke their full minds on behalf of the benevolent lookers-on. But a more completely barren conference probably never met. Not one ray of light was thrown on the labor problem from any quarter. Tom Mann's case was that there were on that day "30,000 men out of work in East London alone, the greater part of whom were responsible as citizens, and responsible as fathers of families," and that "this was a state of things so frightful that it would not bear calm contemplation without making the very blood boil in the veins of straightforward men and women." Of course it did the men out of work no good to have other people's blood boil over them, so Mr. Mann had to produce a remedy. The first feature in his plan was the prohibition of "overtime," so that the work done in overtime by the employed would go to the unemployed; then a compulsory reduction of the day's work to eight hours as a maximum. If after this there still remained any men out of work, there should be for them "municipally controlled workshops, where all those who could not get work under ordinary circumstances should be drafted, instead of being left at the street-corners, and ultimately finding their way into the workhouses and jails to live at the expense of the community. They should be drafted into the municipal workshops and provided with raw material to make that which they require for their own consumption or its equivalent."

Of explanation how this scheme would work in practice Mr. Mann did not offer one word. If we use the light thrown on it by French experience, when Louis Blanc's "national workshops" were tried in 1849, and by everybody's experience of human nature, we should say that what would happen would be this: The men now in employment would, on learning that they

were sure of work in any event, grow more and more careless and insubordinate in doing such work as they already had, and would go "on strike" with increasing frequency, compelling private employers either to discharge them in greater and greater numbers, or retire from business altogether. Consequently, the "municipally controlled work-shops," instead of having 30,000 men to find employment for, would probably find themselves before many months supplying "raw material" to 200,000 or even 300,000 men. In fact, there would be practically no limit to the demands on them. All the lazy, the mutinous, the incompetent, and the drunken would crowd into them, in the perfectly reasonable expectation that, being political workshops in which nobody was interested either in making a profit or keeping down expenses, and in which political "pulls" would tell, the work in them would be light, the hours short, and attendance irregular. The spectacle of 30,000 men out of work even in such a huge city as London, to which so much human good-for-nothingness drifts from all parts of the world, is doubtless a very painful one; but people whose blood boils over it must not forget the part it plays as that external spur to industry and honesty which somehow thus far seems an absolute necessity in every field of human endeavor. Probably 500,000 men are kept "up to the mark" in London by the sight of these 30,000 industrial failures.

There is a commission now sitting in New South Wales on the labor question before which the representatives of labor are making a desperate battle for the enforced recognition of the unions by the employers in all labor disputes. The same contention will probably be made before the Royal Commission which is shortly to sit on labor in England. The laborers have put it in the forefront of their battle in England during the late great strikes. But no civilized government can make any such concession without providing penalties to enforce on the workmen the fulfilment of any contracts into which the unions may enter. At present the great and indeed fatal objection to treating with the unions is that they cannot keep their promises. If the employers accede to their demands to-day, there is no guarantee that another strike against these very terms may not be made in a week, or that the men may not abandon work without giving any reason. In addition to this, no government calling itself civilized can recognize the unions as corporations without providing protection for those workingmen who do not choose to belong to them. At present the persecution or annoyance of everybody in the same trade who does not join them, is one of the chief duties of every union. If the power or importance of the unions were increased, the lot of the men who prefer to manage their own lives in their own way would be harder than ever. In fact, every union we have yet heard of contains the promise and potency of a tyrant and oppressor. The world does not want to begin the battle of personal freedom over again.

There was an old mediæval custom of putting up during Lent in the churches a "Devil's Advocate," to dispute with the priest occupying the pulpit, but he was, of course, bound by the terms of his employment to suffer himself to get the worst of it in the controversy, and finally to be ignominiously routed. An attempt to revive the practice in one of the churches of Rouen in France two or three years ago led to a riot, which necessitated the clearing of the church by the police. The Devil's Advocate played false, and, instead of giving ground before the pulpit orator, he held firm and made himself too much for the priest, amid the wild applause of his irreverent followers among the audience who thronged the church to see the fun. This led to the discontinuance of the spectacle in Rouen, but this year it has been revived in Paris, in the interest of socialism, as a means, we presume, of getting some of the workingmen to go to church. A Socialist orator has been allowed in one of the churches to contend with the preacher about the evils of our present social organization and the proper remedy for them, and the audiences are said to be very large; but whether the debates inure to the benefit of the Christian religion may well be doubted. We have seen no full report of them, but it would seem that the Socialist tells that old story about the "exploitation" of the poor man by the capitalist; about the poor growing poorer and the rich richer; about the ease with which rich men get loans, while the poor, who need them most, can get none, and about the right of the laborer to the whole products of his labor. Where he and the preacher join issue is probably in searching for a remedy. The Socialist doubtless wants ownership of the "instruments of production" by the State, and State loans of money to all comers without security, while the priest insists on a more regular attendance at mass, the taking of the sacrament at least twice a year, frequent resort to the confessional, the sending of children to church schools, and greater respect for clerical advice. It is easy to see that if this supposition be correct, the disputants are separated by an immense interval; but if the discussion can be carried on calmly in a church, it will show that the French Socialists are more reasonable than they used to be.

M. Leroy-Beaulieu blows a terrible blast, in the last number of the *Économiste Français*, against the work of the French Tariff Commission which has just made its report. He says their bill, which, though it puts cotton, silk, and hides on the free list, raises the cost of nearly everything else 20 per cent., will not and cannot be executed. He says 600 men in frock-coats and blouses cannot decide for a great country containing 40,000,000 of population how it is going to live and labor; that there is something stronger than parliaments, namely, the "force of circumstances"; that the immense exporting interest in France will rise against a tariff which reduces their trade with nearly every foreign country; and that the consumers—the professional classes, the salaried classes, the working classes who do not participate in tariff-made profits—will see to it that the same fate shall overtake the bill as overtook the corn laws in England and has overtaken the McKinley Bill in the United States. In short, he remarks, "We consider the work of the Commission still-born. The bill may be passed, but it will not be executed for more than three months. It will be attacked with irresistible fierceness by the million of households which are supported by our exporting industries, by the cultivated, literary, and artistic class, which is not only the ornament of France, but its great attraction and advertisement to foreigners; and it will be ruined from top to bottom by the retaliation which it will call forth from foreign countries in the abrogation of the treaties relating to art, literature, and trade-marks."

Belgium, notwithstanding Mr. Depew's ranking her among the converts to the policy of protection, still remains one of the few countries of Europe that cling to the idea of commercial liberty. In the course of a recent debate in the Belgian Chamber, reference was made to the new French legislation, so pronouncedly protective in spirit, and fear was expressed that Belgium would find her market in France greatly restricted. Thereupon a prominent member observed that the true way for Belgium to meet the situation was to make still lower the duties on raw materials and all imports that have any effect upon the country's ability to export goods. In this way, he maintained, Belgian manufacturers would have a new advantage over their French competitors in the foreign trade, which, together with the extra handicap of the latter in the shape of taxed raw material, would enable Belgium to win from France more of the South American trade than would be needed to make up for the diminished commerce with France. Then let heavier taxes be laid on imports of luxuries, and the deficit in the Treasury would be made good, while the productive power of the country would be increased. M. Beernaert, the Minister of Finance, joined in the debate, and, though he did not explicitly commit himself to the plan suggested, he made it plain that any changes in the Belgian tariff would be in the interests of commercial freedom. He called attention to the significant fact that the trade returns for the four countries of Europe which still stand out against the general invasion of protection—England, Switzerland, Belgium, and the Netherlands—were more satisfactory than those of any protected country, while the one with the least industrial development yet did a business, under a system of liberty, which, relatively to the population, was twice as great as that of France or the United States, and almost four times that of Austria or Italy.

OUR LEGISLATIVE ANOMALY.

THE figures compiled by Mr. Dockery of Missouri showing the comparative appropriations of public money by the Fiftieth and Fifty-first Congresses may not be strictly accurate as regards the latter, because there has not yet been time to examine them closely; but if they err at all, they err in the direction of underestimate. About the appropriations of the Fiftieth Congress there is, of course, no question whatever. The following figures have been printed by the *Herald*, which first obtained them; they will serve to give a point to what we are about to say :

Appropriation Bills.	Fifty-first Congress.	Fiftieth Congress.
Agricultural.....	$4,827,253	$3,385,780
Army.....	48,810,000	48,771,415
Diplo. and Consular.	3,367,740	3,408,490
Dist. of Columbia...	11,372,669	10,733,816
Fortifications.....	8,007,738	5,177,594
Indian.....	23,389,016	16,299,424
Legislative.....	43,084,278	41,598,713
Military Academy..	837,360	1,217,809
Naval.....	55,677,689	41,635,345
Pensions.....	233,672,246	163,516,900
Post-office.....	150,133,920	127,465,577
Rivers and Harbors..	25,136,295	22,397,616
Sundry Civil.....	67,247,645	51,598,145
Deficiency.....	76,617,448	35,986,743
Miscellaneous.....	27,737,905	15,670,862
Indef. appr'priat'ns.	2,236,000	
Total annual.....	$782,155,210	$588,864,229
Permanent.....	227,115,261	224,331,853
Grand total.....	$1,009,270,471	$813,196,082

Now, more than one-half of these thousand millions of public money appropriated by the Congress which has just come to an end, was voted by a body of men who had been already dismissed from office by their constituents after as complete a trial as legislators as any men in American public life have ever had. They entered on the duties of their office in December, 1889, and they sat continuously from then until October, 1890, legislating vigorously all the time under a new set of rules specially devised by themselves to facilitate their business. They then went with their handiwork before the country and asked for its verdict, and they went, of course, on the assumption on which not only American democracy, but all free government, is based—that the electors are competent judges of the qualifications of the elected. It was not open, therefore, to a Representative, when called to account, to question the judgment of the voters, and the Republican Congressmen did not in November question the judgment of the voters touching either men or measures. They delivered themselves into the hands of their constituents by every means known to American usage—speeches, articles, books, pamphlets, pictures, forged extracts, and cross roads talks. They knew well that any claim to an occult body of doctrine too strong for popular comprehension, and held in a sort of hierophantic reserve by such prelates as Reed and McKinley and Lodge, would, if produced either on the stump or in the press, have covered them with derision and made their defeat certain. They therefore took care not to produce any such claim. They said to the voters, "Here we are and here is our handiwork. You are the sole judges of both. If you approve, send us back. If you do not approve, dismiss us."

The voters in due course exercised their ancient and unquestioned right by dismissing from the service of the United States an unprecedentedly large proportion of the majority. No party has, in the history of the country, ever received such a mark of popular disapproval as was inflicted on the Republican party in the November election. No such vote of "want of confidence" is to be found in our political annals. Only a handful of the legislators of 1889–'90 got back to Congress. In every legislative body either of our time, or of any time, except the Congress of the United States, such a defeat at the polls would have returned the defeated candidates *instanter* to private life. It would have stripped them of both power and emoluments on the day on which the vote was declared. And this effect of defeat is necessary not only to good government, but to safe government. A ministerial officer may be safely left in office after he has received notice of dismissal, because his duties are defined by law, and nothing of importance is left to his discretion. But a legislative or judicial officer cannot. A judge who has been removed for incompetency or corruption cannot be allowed to mount the bench again to pass on other men's title to life or property, and a legislator whose legislative work has been emphatically condemned by the voters ought not, in like manner, to be allowed to go on legislating.

All our State constitutions act on this most wholesome and necessary rule. All foreign parliamentary States act on it. It is only the Congress of the United States—and this by a bungle in the matter of dates—which is exposed every two years to the irruption of a horde of discredited politicians armed with full legislative power, for the manner of exercising which they owe no responsibility to anybody. The House of Representatives, which has been sitting since December last, and adjourned on Wednesday week, had, in fact, no constituents. Nobody could punish it for misconduct, nobody could call it to account. It had nothing to fear or hope from public praise or censure. And yet, such as it was, it had the legal power to loot the richest treasury in the world and divide the booty as it pleased. It accordingly went back to Washington and voted away over $500,000,000, knowing that the individuals of the majority would be out of sight, and most of them out of mind, before the public got accurate knowledge of what they had been doing.

In truth, the conduct of the majority since the election has furnished a more impressive justification of their dismissal than their conduct before the election. Had they been men worthy of their places, their defeat at the polls on such a tremendous scale would have made a deep moral impression on them. They would have received it as a decided, even if unpleasant, proof that they had lost public confidence, and they would have gone back to Washington for the remainder of their term in the spirit of an honorable trustee or bank president who has been removed for errors of judgment, and is simply holding office till his successor is ready to assume its duties. Such a man would confine himself strictly to routine work. He would avoid all acts calling for the exercise of discretion, all use of doubtful powers, all persistence in a policy condemned by his constituents, and particularly all expenditures of funds which were not strictly mandatory. If he were not an honorable man, he would act very much as the Republican majority have acted—that is, he would endeavor to make hay while the sun shone by using all authority left in his hands to fill his own pockets and those of his supporters in the Board of Trustees, and making as many contracts and engagements on behalf of the bank as could possibly profit him personally without getting him into the hands of the police.

On one point the late majority have gone beyond even the most notorious rogues of ancient or modern times. They have actually turned round since the election and begun to deny their employer's ability to understand his own business. We do not believe there is anything either in political or criminal annals equal in brass to the contention of Reed and his confederates, carried on up to this day in their organs in the press, that the people do not understand their legislation, and may not understand it for years to come, and that, therefore, their dismissal was due to the stupidity of their masters.

HARRISONIAN "KEYNOTES."

THE President has put forth, through the medium of Senators Hoar and Dawes, the following authorized explanation of his motives in removing Gen. Corse from the Boston Post-office:

> "The President thought that, considering the attitude of the Democratic party, which was murdering United States Marshals and expelling Republican postmasters from their offices in the South, and endeavoring to overthrow constitutional government by revolutionary proceeding both in the House and Senate, and by preventing honest elections wherever they could get the power so to do, it was not wise to appoint to an important office a person who made no expression anywhere of disapprobation of these things, and whose political influence, so far as it was exerted, was in their favor."

This remarkable utterance may be taken as an accurate diagnosis of the President's mind as he stands at the beginning of the second half of his term. It "sounds the keynote" of the policy which he is henceforward to pursue in regard to appointments for public office. It will be seen at a glance that it is a very different keynote from the one which he sounded in his letter of acceptance, for in that he declared that "fitness and not party service should be the essential and discriminating test in appointments to every grade, and fidelity and efficiency the only sure tenure of office." It is a very different keynote, also, from that which was sounded in the Republican platform upon

which the President was elected, for that declared that "the spirit and purpose of the [civil-service] reform should be observed in all executive appointments."

It is difficult to comment upon the present keynote and observe strictly the respect due to the President's high office. We must leave to other and more reverent pens the task of showing the strength and logic of Presidential reasoning which holds that the citizens of Boston were justly deprived of the further service of the best postmaster they have ever had, because he had failed to express disapprobation of alleged partisan proceedings by members of his own party in the Southern States and in Congress. To us it would seem that if he had expressed such disapprobation he would thereby have furnished cause for his removal. As we understand it, it was not a part of his duties as Postmaster of Boston to express views of any kind about what his own or any other political party was doing in the Southern States or anywhere else. He was there to administer the office in the best interest of the public, and he did this so well that citizens of all parties united in demanding of the President his continuation in office. This sentiment was so strong that the two Republican Senators who now publish the President's explanation advised him to yield to it, and the eminent Republican politician whom the President decided for the reasons given to put in Gen. Corse's place, joined them in the same advice, saying of the General's conduct in office: "Politically, personally, and especially in business matters, Gen. Corse has made an unexceptionable record in his present office. He has resisted the Democratic wolves, he is the head of the Loyal Legion, and his reappointment would silence a part of the criticism, justly made, against the Post-office Department, that it has yielded too much to the place-hunters, in this case Republicans. In a measure the removal of Mr. Saltonstall would be offset by the renomination of Gen. Corse. If the interest of the public service is to decide, Gen. Corse will be renominated." But the interest of the public service was not to decide, and consequently a man who had been one of the bravest generals of the war, was turned out of an office which he had administered to the highest public satisfaction, because he had not expressed "disapprobation" of partisan matters which were none of his business.

We presume that the explanation which the President has given of his conduct in relation to Gen. Corse will be made to fit also the appointment which he made last week of William R. Leeds as Marshal of the Eastern District of Pennsylvania. This is so bad an appointment that its defence on ordinary grounds is an impossibility, but, viewed as a rebuke for Democratic misdeeds in the Southern States and elsewhere, it may be justifiable under the present Harrisonian policy. Leeds is one of Quay's tools in Philadelphia, and has been the leader in the worst political ring that city has ever known. He was repudiated by his party in 1887, when he ran as Republican candidate for Sheriff, and, though handsomely endorsed by James Gillespie Blaine, was defeated by more than 7,500 votes, running more than 25,000 votes behind his ticket. Quay was anxious to have the President nominate Leeds for Postmaster of Philadelphia, and pressed him for that office, but the protests from Philadelphia Republicans were so emphatic that even good Mr. Wanamaker was afraid to disregard them. Even the Philadelphia *Press*, which is able to defend Quay, is not equal to the defence of Leeds, and says frankly: "The repudiation of Mr. Leeds by the Republicans in this city was not a mere caprice, but a deliberate judgment founded on abundant reasons. His appointment as Marshal is a virtual overruling of it as far as Federal authority can do so. It is an appointment which should never have been made, and will deeply disappoint the President's best friends in Pennsylvania."

The trouble with the *Press* is that it is not looking at the appointment in the proper light. We advise it to peruse thoughtfully the Harrisonian explanation of the Boston appointment. With that as a keynote of policy, all becomes clear. Appointments are to be made henceforth, not in accordance with the demands of local sentiment, and not in accordance with the fitness of candidates, but in accordance with what the wicked Democratic party is alleged to be doing to thwart the beneficent purposes of the Harrison Administration. As that wonderful newspaper, the Boston *Journal*, puts it in sustaining the President's position, the "aggressive opposition to every Republican measure on the part of the Democrats in Congress and throughout the country, the slurs upon the Administration by the Democratic and the miscalled independent press, indicated that any act of magnanimity upon the part of the Republican President would be interpreted as an admission that the party was weak in men and weaker still in the courage to exert its legitimate prerogatives." That is the way to look at it. The party must show a bold front to all "slurs" by turning good men out of office and putting Republican partisans and rascals in, or it will be considered as being "weak in men and weaker still in courage." The intellectual aspect of this position is a thing upon which no unregenerate Mugwump should trust his discretion with a comment.

THE LAW OF THE BARRUNDIA AFFAIR.

Secretary Blaine and Secretary Tracy have each affirmed, by their conduct in the Barrundia case, that a law forbade Guatemala to visit the American ship *Acapulco* in order to arrest Barrundia. Each has, by what he did in that case, declared that Guatemala could not arrest Barrundia, because he had committed a political and not a common-law offence against Guatemala. Secretary Blaine and Secretary Tracy have each of them been repeatedly asked for the book and page which contain a law forbidding Guatemala to make the arrest. Thus far each of them, although often requested, has failed to do so.

As President Harrison dismissed from office our Minister at Guatemala because he did not resist, but assented to, the arrest of Barrundia by Guatemala, and as Secretary Tracy censured our naval commander then in the port where the arrest was made, because he did not prevent, or resist, the arrest, what should the country say and do to President Harrison, Secretary Blaine, and Secretary Tracy, if Mizner, our Minister, was dismissed from office contrary to law, and Reiter, our naval commander, was censured contrary to law?

It is important, for many reasons, to ascertain what the United States have declared to be the law of the Barrundia transaction. Secretary Blaine's immediate predecessor in the Department of State gave an opinion from which the inference is irresistible that, in his opinion, Guatemala was entitled to make the arrest which she attempted. It is believed that such an opinion has been uniformly upheld in the Department of State when there has been occasion to consider a similar question. Not only the Executive Department of the Federal Government, but the Judicial Department, has expressed opinions which justify the conduct of Guatemala, of our Minister, Mr. Mizner, and of our naval officer, Reiter. In a case reported in the ninety-second volume United States Reports, page 520, the Supreme Court declared that, "unless treaty stipulations provide otherwise, a merchant vessel of one country visiting the ports of another for the purposes of trade, is, so long as she remains, subject to the laws which govern those ports." The question in that case was whether Gen. Butler, when in command at New Orleans, was justified in compelling certain articles of money, silver plate, and bullion to be removed from a Prussian vessel, and her clearance to be withheld until his order should be complied with.

In a case reported in the 120th volume of the United States Reports, page 1, the Supreme Court again declared that, unless exempted by treaty, a foreign merchant vessel, entering a port of the United States for the purposes of trade, is subject to the local law, and the local courts may punish any crime committed in the vessel within the port by one foreigner upon another foreigner. The vessel in that case was Belgian, and lying in one of the ports of New Jersey. There was a treaty between Belgium and the United States conferring power upon Belgian consuls to take cognizance of differences between captains, officers, and crews of Belgian merchant vessels in our ports, and also stipulating that the local authorities shall *not* interfere "except when a disorder arises of such a nature as to disturb the tranquillity of public order on shore or in port." The Supreme Court decided that the treaty did not apply to a felonious homicide on board of a Belgian merchant vessel in one of the ports of New Jersey. In disposing of the case, the Court said: "It is a part of the law of civilized nations that when a merchant vessel of one country enters the ports of another, for the purposes of trade, it subjects itself to the law of the place to which it goes, unless, by

treaty, or otherwise, the two countries have come to some different understanding or agreement; for, as Chief Justice Marshall said in the *Exchange* case, 'it would be obviously inconvenient and dangerous to society, and would subject the laws to continual infraction and the Government to degradation, if such merchant vessels did not owe temporary and local allegiance, and were not amenable to the jurisdiction of the country.'" The Court also said: "As the owner has voluntarily taken his vessel for his own private purpose to a place within the dominion of a government other than his own, and from which he seeks protection during his stay, he owes that governernment such allegiance, for the time being, as is due for the protection to which he becomes entitled."

The Court, in this case, referred to a decision by the French Court of Cassation, the highest judicial tribunal of France, in which the French court declared "that merchant vessels entering the port of a nation other than that to which they belong, cannot be withdrawn from the territorial jurisdiction *in any case in which the interest of the State of which that port forms part finds itself concerned.*"

If President Harrison, or Secretary Blaine, or Secretary Tracy claims immunity for his action in the dismissal of our Minister and in the censure of our naval officer, and claims it under a law which gave protection to Barrundia from arrest by Guatemala while the *Acapulco* was in one of her ports, the President, or the Secretary of State, or the Secretary of the Navy should be able to furnish the text of such a law, or the accepted principle of international jurisprudence from which the deduction of such a rule is inevitable. As not one of them has yet offered such a text or such a principle to the inspection of the country, the inference must be that neither text nor principle is in existence.

Barrundia's widow has made a claim against the United States for $1,000,000 for the loss of her husband. Under the rulings of both the State and Navy Departments, she has a moral claim to the money. What answer to her have they got? "Let us keep still and maybe the affair will blow over," they probably say. Oh, no, it will not blow over until we get from them the law of the case.

A FRENCH VIEW OF THE ITALIAN SITUATION.

PARIS, February 19, 1891.

THE retirement of Crispi is an event of no small importance. He was known to be the stanch advocate of the Triple Alliance, and he enjoyed the perfect confidence of his King, who had repeatedly given him extraordinary marks of favor. There was some surprise felt in the world when Italy entered into the Triple Alliance, as this alliance was visibly directed against a possible combination of France and Russia; but those who knew Italy well were not much astonished. Italy has become thoroughly convinced that there is no Power in Europe which could or would eventually destroy her unity except France. This conviction may be completely erroneous—I believe myself that it is; but it is very widespread. There is a general conviction on the other side of the Alps that if France had a monarchical and clerical government, such a government would be unfriendly to the House of Savoy, would make some effort in order to reëstablish the temporal power of the Papacy, and would even perhaps reconstitute the kingdom of the two Sicilies. Italy seems to dread nothing more from her old enemy, Austria. The declamations of Irredentism are not signs of any real hostility. Austria seems herself to have completely renounced all idea of ever garrisoning again the beautiful cities of northern Italy and the Romagna; she has turned her back on the south and is looking only eastward: is she not *Oesterreich?*

Just or unjust, the fears which Italy feels with regard to France would not perhaps have sufficed to induce her to enter into the great constellation of the German Powers. Italy might have remained neutral in the midst of the complication of European affairs; she had fairly reorganized her finances, she was becoming more industrial, more wealthy; she would probably have gained more by adopting a determined and systematic non-intervention policy than by any other means. But such a policy is absolutely contrary not only to the Italian genius, but also to the peculiar genius of the House of Savoy. If you read the history of this extraordinary house, you will have the key to its policy: "Avanti, Savoia!" is its motto. The Dukes of Savoy, afterwards the Kings of Piedmont, have always been ready to run great risks: in our own times, remember Novara, remember the Crimean expedition, Solferino, all that came after Solferino, and finally the attack on Rome. The Piedmontese advisers of the King and the King himself all labor under a conviction that the House of Savoy has a "manifest destiny," and that this destiny can only be accomplished by a policy of action. It is not enough to wait for events; such men as Cavour and Crispi think they must prepare events. And who could better help the Italians to prepare events, a few years ago, than the all-powerful *Kanzler* who had in his hands all the diplomatic strings of Europe? Who could smooth matters better between Austria and Italy than Prince Bismarck, who had formed the alliance between the two German empires, and thus formed a great European barrier against Russia? It is not to be wondered at that Italy allowed herself to be tempted by the prospect of forming a part of this great pacific alliance; her accession to it seemed to give her a greater dignity, to open a new horizon in the East and in the Mediterranean; it secured for ever her newly conquered unity.

This was the brilliant side of the affair; there was, unfortunately for Italy, another side: she could only enter the Triple Alliance prepared for certain eventualities, and the preparation was a costly one. Her army, her navy, her armament had to be put in readiness for all contingencies. She had, with many difficulties, and not without much merit, put her finances in a good state; now she was to incur enormous expenses, and the era of deficits in the budget was about to recommence. You can feed a proud nation with glory, or even with promises of glory; but you can only do so for a certain time. The tax-gatherer does not wait. The Italian people is, at the present moment, quite overburdened. During these last few years Italy has reminded me of Bluebeard's wife, in Perrault's tale, standing on the top of a high tower, looking round, and questioning her sister—

"Ma sœur Anne, ma sœur Anne,
Ne vois-tu rien venir?"

No; Italy, like sister Anne, saw nothing coming, and she also could say: "Je vois la poudre qui poudre et l'herbe qui verdoie."

The Triple Alliance brought nothing except increasing expenses and increased taxation. Crispi had completely identified himself with the policy of the Triple Alliance, and for a long time he seemed unassailable. Cabinets might fall, he could not fall. His Cabinets, in fact, had become a mere harlequin's coat: when one piece was torn or faded, he simply put in another. Things began to take another aspect when Prince Bismarck fell from power. Crispi had been, with the great Chancellor of northern Germany, a *persona grata;* his prestige was partly derived from the prestige of Prince Bismarck, who had thought him worthy of his confidence and had made him an associate in his great designs. When the Emperor of Germany struck Bismarck, he indirectly struck Crispi. The Italian Premier, who seemed necessary as long as the German Chancellor himself was necessary, was now almost left to himself, and he had to face an entirely new situation. Instead of being one of the gods of Olympus, he fell among the demi-gods; he was reduced to the rank of an ordinary Prime Minister.

Crispi did not lose heart; he still enjoyed the confidence of the crown; he hoped, with this powerful help, to be able to weather the parliamentary storms. The great cry was economy, the diminution of the national burden; he studied more carefully than he had done before the situation of the finances. Though the principal instigator and first mover of the Triple Alliance was no longer in power, the duties of the allies remained strictly the same; it was not possible to save anything on the expenses of the army and of the navy. But two reforms seemed possible to Crispi: (1.) It was possible to reduce the number of the prefectures in Italy, and by this means all the administrative expenses connected with the Home Office. (2.) There was a great anomaly in the existence of several State banks in unified Italy. Would it not be better, in the interest of political unity, in the interest, also, of the commercial classes, to have a single bank of emission, such as the Bank of France, as the Bank of England?

As soon as Crispi had made up his mind first to diminish the number of the administrative subdivisions and offices, and to merge all the State banks into one (two measures, by the by, which had no party character), he threw himself into the business with his usual ardor and determination; but he soon found that it is not safe for a minister who has ceased to hold an exceptional and impregnable position, to attack private or corporate interests. The project of the prefectures alarmed the great and powerful class of the functionaries; the project of the State banks alarmed the financiers of the provinces. The activity of the Opposition became incessant, and the parliamentary majority was visibly dissolving. When Crispi became aware of his danger, he had no hesitation; he threw down the gauntlet to the Right, and made the most aggressive speech against his enemies. He knew he must fall, but he chose to fall on the Left, so as to become the leader of the Left immediately after he had quitted the Cabinet. The time was past when he could manœuvre between the Right and the Left; his only chance of returning to power with an increased strength was in making himself again a partisan. He deliberately insulted the Right, and accused it of having mismanaged the finances of Italy when it was in

power. It was evident to all that he wished to abandon power for a time, and that he was tired of struggling with a Parliament which had ceased to follow him blindly.

The King was obliged to form a Cabinet with very mixed elements, and to go from Rudini, a stanch Conservative, to Nicotera, a stanch Radical. Coalitions are sometimes necessary in parliamentary life; they may be formed under the influence and at the dictation of a man strong enough to impress his will for a time upon a number of men opposed in general principles, but willing to act for a time in harmony, in view of some great object or merely under the pressure of necessity. There are other coalitions which unite accidentally men who have no common principles, who have only what may be called negative objects, who are working against a common enemy, and who, after having been united for a day, separate as soon as they come to discuss some new measures. The present coalition which is personified in the Rudini-Nicotera Cabinet, seems to belong to this second class of coalitions rather than to the third. I look in vain for the superior man who can impress his will, for the leader who can make himself obeyed in all circumstances. In all probability, the Italian Parliament, after a short period of lassitude and confusion, will have to be dissolved, and new elections would probably give the majority to the Left and to the groups of the Left who follow the leadership of Crispi.

Much depends, however, on events which are out of the control of the Italians themselves. Crispi must share more or less the fate of the Triple Alliance; he must even share, to a certain extent, and by an indirect influence, the fate of Prince Bismarck. We hear very strange things from Germany—so strange that we can hardly believe them, and that we remain incredulous. The young sovereign who now rules in Berlin has a singular idea of his mission. It is not long since he sent his full-length portrait to the German Embassy in Paris. The portrait is not without artistic merit, but when you look at it, it seems as if you were looking on some portrait of past centuries. The Emperor is standing so that you see only his profile, sharp and well cut; in his hand he holds the sceptre, like a staff of command, with a bold gesture, as if he were holding a sword. The sky forms the background. The picture reminds you of the famous pictures of Louis XIV. It is evidently symbolic; the young Emperor must have himself chosen the attitude. We have seen him at work since he ascended the throne. His restlessness denotes a hurried ambition, and an ambition which extends over all objects; the world is waiting with some anxiety for what may be inspired by this uneasy genius, which will brook no obstacles. Italy has placed herself in the rear of Germany; she must, directly or indirectly, bear the consequences of the alliance which she has been so anxious to form.

AMERICA IN THE GUELPH EXHIBITION.

London, January, 1891.

I have made two visits to the Guelph Exhibition now in progress, and with an eye to the interest which it has for students of American history. The *Times* to-day, in discussing the Bering Sea difficulties, says, with a good deal of truth, that the Americans have had no history of much interest to the world except as it has grown out of the relations which they have sustained, either in a friendly or inimical way, with England; and so one may go to an exhibition intended to record all that there is remarkable in English history from the accession of George the First to the death of William the Fourth with a not unreasonable expectation of seeing American history traced more or less remotely in the grouping. It is indeed so remote for the years of the first George that there is hardly a picture in the Exhibition suggesting an American reference. For the period of the second George there is not much, and what there is relates to the conquest of Canada and to the war against Spain in the West Indies. No naval name of this reign is more frequently, I suppose, on the lips of Americans than that of the Admiral with whom Washington's brother served, and whose name became for this reason attached to that estate on the Potomac which the nation preserves in memory of its most illustrious citizen. When one looks upon the picture of Admiral Vernon as drawn by Gainsborough, hanging here in the neighborhood of such heroes of the sea as Hood, Vincent, and Rodney, one is quite inclined to believe that it was a happy stroke of luck that gave him Porto Bello when he risked all and captured it with the aid of six ships of the line, and that his later failure at Carthagena with a much heavier armament was more in accordance with the intellectual smallness of his personal bearing. One finds far more satisfaction in the shrewd energy displayed in the face of Boscawen, as Reynolds, with his momentary art, caught it in the half-length which tells of the capital exploit when Louisbourg fell in 1758, to make an opening for the great victory of Wolfe the next year.

Of the victorious general on the Heights of Abraham there is but a single picture, and that is a small full-length in uniform, of which I do not remember any engraving, and it is lent to the exhibition by a private owner. To those who are most familiar with the profiles that so belie his character, this picture is hardly recognizable; and there is little of the heroic in either to suggest connection with the sword which he wore, and which is here exhibited by favor of the Royal United Service Institution, and the cloak in which he died, which I found exhibited the other day amid the armor preserved in the Tower.

When we come to the reign of George the Third, there is much more of direct interest, though there are but three Americans represented by likenesses. Considering the number of good Washingtons that there are in England, beginning with the superb Stuart which Lord Rosebery has, and which has recently been engraved in the *Illustrated English Magazine*, it is rather surprising that the Committee should have been content with a small profile in pastel, which stands uncredited in the catalogue, but which seems to be one of Sharples's, or perhaps a copy from his studies. A china statuette and one of Wedgwood's reliefs—the last not unsatisfactory—also add to the record of the importance which Washington maintained in the reign of the third George.

Franklin is represented by a small picture belonging to Earl Stanhope, of which the catalogue says nothing as to its authenticity. It is the familiar picture, where Franklin sits reading with his thumb to his chin, and is probably a copy of the large picture which used to hang over the fireplace in the house of Mr. Henry J. Williams in Philadelphia, as I remember it there fifteen years ago. There are two attempts of Wedgwood to depict the shrewd and placable lines of the philosopher's face in one of the cases near by, as well as a similar likeness of Franklin's Tory son. One turns easily from Franklin to the London printer Strahan, to whom Franklin sent, on leaving London in 1775, that well-known epigrammatic letter; but only to find in Reynolds's drawing of his unemotional and almost un-Scottish face little to counterpart the wit and lubricating sense of the American printer.

The two dominating figures of the whole collection are those of the third and fourth Georges, and one sees them in every aspect and in every style. The befrizzled simper and dancing-master attitudes of George the Fourth tire one to death, on canvas, on panel, on ivory, in wax, in enamel, in china, on snuff-boxes, on brooches, on medals; and even one of his eyes was thought divine enough to paint in a cloud and to be set in a royal ring! The effigies of George the Third are quite as numerous, but one has a sort of respect for that stubborn monarch who forced Lord North to continue the war with the colonies against all hope. As a young fellow in his princehood, George the Third was not a man to be avoided, if we may judge from the picture which Reynolds painted of him in 1759, and which the Queen has sent from St. James's Palace. It is perceptible how, as he grew older, his face hardened, grew less flexible, and looked almost stolid; for even the grace of Gainsborough in the full-length which he exhibited in 1781, and which has been brought to the exhibition from Buckingham Palace, fails to make one look with more than a certain pity on the obstinate King of those troublous days. The almost too numerous miniatures which help to impress that face and air upon the spectator—though some of them are exquisitely done—the wax model made by Flaxman, and the enamels, ivory medallions, and medals which recur so often as one glances along the glazed cases in the centre of the rooms, are significant of the unwavering steadfastness of the King while his reason remained, and mark many stages in a reign whose great duration his granddaughter seems desirous of emulating.

Of all the men who stood in Parliament as representing the royal will, one looks with most pity on that poor Lord North whose likeness there in the top row seems to show his amazement at his sovereign's stubborn consistency. He sits leaning back as if with an air of resignation to do the King's bidding, while his own judgment revolted at the miserable task he was put to do beyond the Atlantic. We never quite understood Lord North till we got that series of confidential notes which he and the King exchanged for so many years, during which the British soldier and the German mercenary were striving to avert the inevitable. I look upon his picture with a new interest in the light of those revelations.

The American who wanders about London seeking the haunts of Dr. Johnson—and there is no personality of the Georgian era more deeply impressed upon London streets—rarely thinks of him as a political pamphleteer, taking sides against the incipient revolution which was growing about Massachusetts Bay; and yet there is not a picture in this collection more forcibly bringing that contest here in London before me than this of Johnson by Reynolds, which Lord Sackville contributes to the exhibition. One almost believes it the attitude in which Reynolds may have seen him thundering out those clamorous postulates which he not long afterwards embodied in his 'Taxation No Tyranny,' which was like a fist struck in the face of Sam Adams. In a brown garb, with dishevelled hair—almost the only picture of Johnson, that is familiar, which has no wig—his features losing something of their bluntness in profile, his hands awkwardly raised one over the other in disputatious fashion,

even his gnawed finger-nails showing in the fidelity of the painter's art—we have in him the incarnation of a rampant spirit of prerogative.

There, not far off, hangs a row of the men that took part in those Parliamentary debates which made the advent of American independence almost more a part of Westminster than of Faneuil Hall. There is Chatham in the figure of his virile prime, full of reserved power, and more a man than he was when he swooned in that historic scene which Copley has painted, but rather nearer in vigor to that waxen effigy in his living garb which the curious stranger sees to-day in a secluded loft in the Abbey. There is Fox, who perhaps enjoyed his harassing of the Ministry more than he cared for American justice—just as Reynolds painted him with the fervor with which he knew how so well to flush his speeches, and shown at an early age when Reynolds did not discern all that rugged strength one sees in the statue which stands opposite the reposeful Pitt in the gallery at Westminster, as the modern sculptor has fancied him. There is Burke, in his pictures more the scholar than the ardent inveigher against wrong, sensitive and sensible as Reynolds depicted him, and supremely intellectual in Opie's hands; there is Rockingham, the refined, inquisitive Liberal, with more power than you feel he might ordinarily exhibit, and we entertain no doubt that Reynolds has not mistaken his character. There is Gen. Conway—and Barré ought to be with him—not handsome, not great, even in looks; but the embodiment of that nerve which so endeared him to his fellow-subjects beyond the sea.

Turning to the belligerents of the struggle in America on the part of the Crown, the representatives are not so many as one could wish. A good many pictures scattered about in the English country-houses—like that of Earl Percy in Alnwick Castle—of those whose names were a terror in many an American hamlet, are wanting. We find, however, Lord Howe, but only in one of Wedgwood's reliefs. Cornwallis is in no better form than on one of those China tea-pots such as I remember seeing in my boyhood in a mansion of the Old Colony. Clinton is shown in nothing better than one of Cosway's mannered miniatures. It is something surprising to see that Sir Thomas Lawrence, in his overfineness, has left anything of dash and hardiness in the half-length of Rawdon, who figures so prominently in the Carolina campaigns. If Rodney had been more intimately connected with our Revolutionary struggle, a superb full-length by Reynolds, which belongs to St. James's Palace, would be a crowning example for this part of the exhibition; but his splendid victory over De Grasse in the West Indies came too late to trouble the Americans, though it served to stiffen the English negotiators during the treaty time; and, but for the ensnaring of Major André, he might, as the confederate of Arnold, have ascended the Hudson with a part of his fleet.

In one of the rooms of the Guelph Exhibition Nelson and Wellington divide the attention, and personal relics of the two fill a case in the middle of the room. With the former we have a slight connection in our American history. He had been made a captain in 1779, and commanded a frigate which cruised on the New England coast in the later years of the war. There are brief references to this part of his career in a recent life by Mr. Latham Browne, drawn from some of Nelson's own memoranda. I was curious to know if there were more details than he printed, and applied to the author; but he tells me he has given everything which he notes of his American experience. What Nelson did made no mark on the progress of the war. He captured a few coasters, and, for some service rendered, let one of those small vessels go, with a safe-conduct, and Mr. Browne mentions this document as still hanging on the library walls of a gentleman in Boston. He is mistaken. When the late Judge Davis lived in that city, it no doubt was so preserved; but it is at present in the cabinet of the Pilgrim Society at Plymouth. I remember a gentleman, almost a centenarian when he died, who at this period was sent off with a flag of truce to a British frigate in the offing from a small New England seaport; and it was his delight in after years—and, dying over fifty years ago, he survived the hero of Trafalgar hard on to thirty years—to tell the story of his reception at the gangway by Nelson, then in command of the ship. This man, whom I distinctly remember, in his queue, small clothes, and buckled shoes, was born in the year when Louisbourg fell before Pepperell. There is among these pictures of Nelson one by Rigaud, taken just before he started for the American station. Like most of his effigies, it has little to remind one of his career. Indeed, among all the likenesses of Nelson accessible to the visitor in London, there is one by Füger, taken at Vienna in 1800, and now in the Museum at Bethnal Green, which almost alone gives the head of Nelson the character that bespeaks his nature.

One easily reverts to this other collection of national portraits to fill out the interest of the students of American history, and hardly another among them attracts so much the attention of a New Englander as Dobson's picture of that Antinomian disturber of early Massachusetts politics, Harry Vane. This picture was given in the first place to the British Museum by Thomas Hollis, whose interest in Massachusetts history never flagged, and in 1879 it passed, by the consent of the Trustees, into the present collection. Not far from the Vane hangs a good picture of Popham, the Chief Justice, which must have been painted just about the time when he was planning with Sir Ferdinando Gorges that abortive colony on our Maine coast. Close by is Raleigh, just in the period when he was lending his influence to the planting of the Carolina coast.

The time of the Canadian conquest is splendidly represented in the portraits of Boscawen, Amherst, and Wolfe. Reynolds gives us the first, Gainsborough the second, while each of the three pictures of Wolfe, side by side, depicts him strangely with his weak and aimless profile, almost a mockery of his deeds.

For our Revolutionary period, Bethnal Green is much the same in scope with the exhibition now going on in Regent Street. It has for Washington an unmistakable profile by Mrs. Sharples, and a picture by Stuart that I don't remember seeing before—what seems to have been perhaps a trial sketch for the portrait now so well known in various replicas, and usually called the Presidential likeness of Washington. This little picture was purchased by the Trustees of the Museum from George T. Meredith so late as 1887. The single Franklin is an interesting one, and was painted in Paris in 1783, just at the time he was concluding the negotiations of the treaty of peace. Its surface is bad, and I suspect some cleaner is responsible for the difficulty. It is not much unlike in aspect the heads which we associate with Greuze.

One is glad to see in the Museum Gainsborough's portrait of Cornwallis, painted two or three years after his disheartening experience at Yorktown. The catalogue, in saying that his surrender took place at "New York," speaks in a certain sense truer than one of better knowledge would have written; for we cannot forget that Cornwallis always considered that it was Clinton's enmity at those headquarters which allowed his subordinate to be entrapped in Virginia. Admiral Howe is never an interesting character in his experiences on our coast, and his portrait is not more attractive.

The political aspect of the struggle on this side of the Atlantic is in some respects better represented at Bethnal Green than in the Guelph Exhibition. There is, for instance, a striking modelling of Reynolds's disputatious picture of Johnson, in a study by the late Sir Edgar Boehm, in which the sculptor was aided by a death-mask. We find here, too, Reynolds's familiar figure of Burke, more alive, perhaps, with that character's peculiar intellectual instincts than any other. Nollekens appears quite in his element in dealing with the ruggedness of Fox. North, though none of his pictures impresses you as that of an able man, was not certainly quite worthy of the littleness which Dance puts into a likeness of him. The most satisfactory of all is Reynolds's preservation of Lord Shelburne in his peer's robes. We owe much to the liberalizing element which this nobleman carried into the councils that finally ended in the treaty of 1782, and we never quite understood the relative value of the aid which the American Commissioners gave in consummating those negotiations till we got access to the papers of Shelburne, in the life of him which his great-grandson Lord Edmund Fitzmaurice has published.

JUSTIN WINSOR.

IBSEN'S "ROSMERSHOLM."

LONDON, February 24, 1891.

THE performance of Ibsen's "Rosmersholm" has been the chief theatrical event in London since the production of "Beau Austin" at the Haymarket. Whether because of the late "Hedda Gabler" dispute, which at the time, however, scarcely created the excitement anticipated by one at least of the disputants, or because of Mr. Henry Arthur Jones's later attack—from the lecture platform—on foul-mouthed realism, or (as his admirers would have us think) because of Ibsen's own force as moral preacher and social reformer, it would be difficult to decide; but certainly the play was looked forward to with unusual interest, and tickets for the only advertised matinée were disposed of so readily that a second performance was rashly promised before the success of the first had been assured.

I say rashly, since of all the Ibsen dramas there is not one which is so hopelessly devoid of dramatic action. In the "Doll's House" and the "Pillars of Society," the only others heretofore presented on the London stage, there are several essentially strong dramatic situations; they are plays which compel one to recognize in them the work of a good dramatist who, unfortunately for the world, has sacrificed his art to moral fads. But with "Rosmersholm" it is a different matter. Interesting as the story is in itself, despite its somewhat childish talk about emancipation and freedom (Ibsen's moral theories in England somehow always do seem a little antiquated), it is, as Ibsen writes it, a story to read, but not to act.

Everything, with the exception of the great final incident, has happened before the curtain goes up for the first time. *Rosmer* has already

shaken off his old political and religious shackles; *Rebecca West's* love for him has long since led her to rid herself of her rival; the suicide of *Beata*, *Rosmer's* wife—the pivot, as it were, upon which the plot turns—already dates back a year. Four acts are passed in explanation of these facts; confession follows confession; confidences are the order of the day. Even the final incident or catastrophe, the suicide of *Rosmer* and *Rebecca*, is but vaguely suggested and realized; we have but the word of the housekeeper for it as the curtain falls upon the fourth and last act. The play deals essentially with effects of causes not set forth with sufficient clearness, and these effects, revealed by words only, never, by any chance, until at the very last, lead to action or incident; it is all talk, and nothing but talk, from beginning to end.

If the business of the dramatist is henceforth to represent solely the development of character, rather than a sequence of circumstances, then "Rosmersholm" is the best example to be had of the drama of the future. And it was probably because it was felt by theatre-lovers to be such a genuine test case—a case between the old and the new dramatic schools—that the house was crowded from stalls to gallery. But the crowd, as might have been expected, was largely made up of actors and actresses (the performance was given on a Monday afternoon), and of the long-haired men and "æsthetically" draped women who haunt socialistic gatherings and private views—people whose soulful appreciation could be counted on beforehand. The average play-goer was conspicuously absent. In the stalls, the critics who had come to scoff held themselves apart, physically as well as mentally, from those who had come to worship. On the one side, Mr. Clement Scott, fresh from his duel of words with Mr. Grundy; Mr. Wedmore, ready to damn with neat phrases, and the men who address themselves to that public whose idols just now are Augustus Harris and Jerome K. Jerome; on the other, Mr. William Archer, who but the week before had been trying through the weekly press to prepare the world for the subtleties of "Rosmersholm"; "Spectator" of the *Star*, and all the radicals in dramatic criticism. A deaf man, by watching these two groups, by noting at moments the elation of the unreclaimed and the dejection of the professed Ibsenites, would have known exactly how the play was going.

There were times when it went very badly indeed. The house was a sympathetic house; there was no exacting pit to groan and hiss and rebel at flagrant disregard of sacred traditions. But, for all that, in some of the most serious passages in the dialogue, the house laughed uproariously—good-naturedly to be sure, but with undisguised mirth. And the house was quite right; the performance at times was as funny as a farce. But the curious part of it was that even as one laughed most unrestrainedly, one asked one's self whether it was really at Ibsen or at his interpreters. For in the most oppressively dull scenes, in the most deliciously irresistible absurdities, not Ibsen, but actors or translator, or utter want of adaptation, seemed to blame. For a certain vagueness as to why *Rebecca* first came to Rosmersholm, why the discovery that she is an illegitimate child should so move her that she at once confesses her guilt, why the plunge into the mill-race should be the one and only solution to *Rosmer's* love and political difficulties, Ibsen alone is responsible.

But a clever stage-manager could easily make this vagueness seem less. In reading the play one sympathizes in a way with the weak, vacillating student, really meant by nature for a quiet domestic life and a quieter political and ethical sphere, and yet imagining it his duty to turn prophet and enlighten the world. But nothing could have been less interesting and more exasperating than the character of *Rosmer* as played by Mr. Benson, a man whose only qualification for the stage is a face of the Irving type. To this very modern rôle he brought all the old tricks of the stage tragedian; of *Rosmer* he made, as I heard it cleverly put, but a "writhing right-angle"; you were amused at his contortions, but never once convinced of his sincerity; his talk of emancipation was the weak boasting of a child who has played truant or broken into an apple orchard. That a woman of the supposed character of *Rebecca West* could have loved him was simply an impossibility. An incomparably better actress than Miss Farr could not have saved the situation. Not for a moment in their relations was there even a suggestion of that reality which alone could make "Rosmersholm" possible as a play. Then the actor who undertook the part of *Mortensgärd*, the radical and atheist editor, got himself up as a sort of villain, a genteel Jack the Ripper, and his first appearance convulsed the audience.

No less fatal, in one place at least, was a blunder of the translator. Mr. Archer apparently has been too busy rooting out the errors in Mr. Gosse's translation to have time to attend to those in a work brought out under his own supervision. When *Rector Kroll* accuses *Rebecca West* of trying to seduce *Rosmer*, he tells her of her mother's shame, and then attributes her own conduct to an "involuntary filial instinct," (!) which is a curious and original definition of Ibsen's beloved theory of heredity. But all this scene cried out for the adapter. *Rebecca* will not believe in her mother's guilt: "My mother never said anything to me about it," she tells *Kroll*, and naturally the audience was amused. And the last meeting between *Rebecca* and *Rosmer*, where they decide to die together, which should have been impressive in its tragical intensity, degenerated into the farcical, simply for lack of a little cutting down and concentration. When they go from the house towards the mill-race, into which *Rosmer's* wife, the year before, had thrown herself, a titter ran through the theatre.

But that the play was still interesting, notwithstanding the many drawbacks to its performance; that one would not willingly have missed it, though, given the same circumstances, one would not go to see it a second time—there can be no doubt. After the play was over, in the lobby and entrance hall, groups stood discussing it for half an hour or so. "Certainly," as one of the Ibsenites said to me, "whatever you may say about Ibsen, you must admit that he sets people to thinking and talking as no other dramatist of the day can." This is in a measure true, for to most people it is much easier to understand a moral problem than a work of art. It may be that "Rosmersholm" is a fair type of the coming drama, and that ten or twenty years hence Ibsen will be looked up to by dramatists as master, just as Manet, despised by earlier generations, now is by artists, Zola by novelists. But in this case a new school of acting will have to be developed in England. Played by the average English actor of to-day, an Ibsen drama might be mistaken for a screaming farce.

However, actors and Ibsen alike are to be provided with every chance in London. Already two schemes for English *Théâtres Libres* are being considered, and one, I hear, before long will be actually carried out. The little Royalty Theatre in Soho, sacred to French plays, where M. Antoine brought his company two years ago, will be secured for the purpose, and the opening performance, in all probability, will be Ibsen's "Ghosts." The experiment will not be without its value. N. N.

Correspondence.

RELIEVING THE SUPREME COURT.

To the Editor of The Nation:

Sir: Congress has now applied a remedy, and it will be a curious subject of observation how it will work. With no desire to find fault, one may venture to call attention to the fact that one of the two objects of a court of appeals has been eliminated from the judicial system of the United States, namely, *compulsory uniformity of law*. One equally important object has been preserved by giving an appeal to a tribunal distinct from the court of the first instance—that is, compulsory obedience to a law of some sort on the part of the court of the first instance. The monstrous system that freed the trying judge from all supervision or control where plaintiffs were content to exact only $5,000, has been terminated, and it is hoped permanently. It may be that this is well purchased by substituting nine systems of law governing contracts, rights of property, and personal rights not involving the death penalty.

The curious problem for the future is how will the system work that creates nine popes for determining the truth in respect of human rights, with an optional right to any one to call a general council to decide between any two of them, and then only so far as a declaration can be a decision. A power of compulsion will not exist in the council, saving for the case in which intervention is asked. Singular mode of obeying the Constitutional command—There shall be *one* Supreme Court!

R. C. McMurtrie.

Philadelphia.

THE TEACHING OF MATHEMATICS.

To the Editor of The Nation:

Sir: A quotation made in your issue of the 12th ult., in the course of a review of Prof. Florian Cajori's 'Teaching and History of Mathematics in the United States,' has, I see, called forth the objection of a correspondent that the passage gives an unfair impression of one of the most eminent of living mathematicians. Permit me to add that it seems to me equally misleading as a specimen of the contents of the book. The words quoted are not those of Prof. Cajori himself, and they occur in the course of a survey of Sylvester's work the whole spirit of which is the exact reverse of disrespect.

The history begins with the colonial period, and, while perhaps "anecdotical," certainly not tedious, in style, it gives evidence of much pains taken to secure accuracy. To all of this historical work—the main subject of the volume—the reviewer devotes but three lines, except as he treats the author's account of the last fifteen years, and this chiefly by making the above-mentioned strange selection.

F. H. L.

Clark University, March 2, 1891.

To the Editor of The Nation:

Sir: Will you kindly allow a little space for a few remarks on the somewhat unjust criticism which appeared in the *Nation* of the 19th

inst. on my work entitled 'The Teaching and History of Mathematics in the United States'? The reviewer places undue confidence in his own opinions when he asserts that the replies given by 168 teachers of mathematics in our leading colleges "prove nothing, unless proof be needed that most college professors know little of the aptitudes of their students." The reviewer finds fault because no replies to questions concerning methods of teaching were secured from Harvard, Yale, Princeton, the University of Pennsylvania, Ann Arbor, Cornell, Clark University, and the University of Wi consin. Is it possible that he failed to see that the mathematical teaching at all these institutions but two was described at length in another place? From most of the eight institutions just named I had received letters with detailed accounts of their work in mathematics before the 1,000 letters with the printed questions above referred to were sent out. For that reason, most likely, these institutions did not consider it necessary to send in information a second time. The obtuseness of the reviewer is brilliantly displayed when he expects reports from Clark University at a time when it had not yet opened its doors to students.

Respectfully yours, FLORIAN CAJORI.

COLORADO COLLEGE, February 27, 1891.

[Complaints about book notices, when not made with a view to the advertisement, are mostly based on the idea that such a notice is mainly written in order to do justice to the author's merit. In fact, its purpose is to give the public such information about a book as it desires, and particularly to show in what way the book may be useful. While we would not deliberately do an author injustice, we cannot go into the question of "pains taken," except in those rare cases where the public desires to hear about that. When so distinguished an astronomer as Sears C. Walker is called "Mr. C. Walker," when other names are misspelled, dates are erroneous, and the information generally defective, great pains may have been taken, but not pains enough. We repeated the nickname and anecdote concerning a great living algebrist, as being well calculated to convey to readers of the *Nation* a hint as to the degree of delicacy of Prof. Cajori's discrimination. "F. H. L." thinks these things "misleading as specimens" of the work; but in truth there is much which were better withheld while the subjects are living, such as: "Professor —— was appointed . . . to supplement Professor ——'s shortcomings," "—— is a far more amiable and congenial person to meet than Professor ——," and the like, the names of the living persons being given. The excuse put forth by "F. H. L." that these things were communicated to Prof. Cajori in private letters, is an explanation that fails to explain.

Another correspondent, "X." (*Nation*, No. 1339), blames us for repeating the story. But in what age of the world, pray, are we living? It was already in print, it was quite true, and, after all, is merely a tale of a bit of eccentricity such as theoretical mathematicians and thinkers generally have been proverbial for since antiquity, and such as may be told of nearly every man living who has made important contributions to pure mathematics. There was a phase of American development (not yet, unfortunately, altogether past) when to say that a person was different from others was an accusation, to call him eccentric simply shocking. Whenever such a charge was made, those of the party's friends who were conscious of superior powers of mendacity, naturally hastened to repel the odious libel, and to assure the public of the maligned gentleman's eminent mediocrity. No wonder that in such an atmosphere mathematical studies have not flourished.

Prof. Cajori must not represent us as pooh-poohing the opinion of 168 teachers. No doubt, were judicious questions asked, their replies would be well-nigh conclusive. We merely said that replies pretty equally divided between "yes" and "no" proved nothing; adding only that, the question being as to the relative aptitudes of two classes of students for mathematics, answers very positive and yet irreconcilably conflicting do go to prove that most of the answerers know little of those aptitudes. From hardly any of the best schools of mathematics were replies to the questions received at all, nor is it true that there is anything in the book equivalent to such replies. The publication is 'Circular of Information, No. 3, 1890,' and therefore one naturally expects to find the opinions concerning methods of teaching held by the instructors at Clark University under the head of "The Mathematical Teaching of the Present Time." But there is nothing of the sort there concerning most of the chief seats of mathematical learning in this country. There are only some generalities under the title, "Influx of French Mathematics," which is surely a thing of the past. The detailed information concerning methods of teaching relates, with some exceptions, exclusively to second-rate institutions.—ED. NATION.]

THE GAP IN PRACTICAL EDUCATION.

TO THE EDITOR OF THE NATION:

SIR: The points raised by your excellent editorial of February 19 upon some of the defects of female education do not seem to be fully met by the "Harvard Annex" plan as represented by Mr. Gilman in your issue of February 26, for it would seem that those who are "not only women with a purpose," but women "advanced beyond the period of leading-strings," must already have received a pretty large share of their education. We who are connected with coeducation schools do not see how the gap can be well filled except on our plan, where young women and young men are held to the same standards and are taught by the same teachers. Is it not also a question whether it is a thing to be boasted of in a woman's school that "there are no women among the instructors"? Indeed, can we be so sure that some women instructors would be entirely out of place presiding over classes containing young men? Must all the young men be for ever excluded from enjoying instruction from such a teacher as Prof. Maria Mitchell proved to be in astronomy? We are far from claiming that the plan of coeducation is above criticism, but that it does supply superior opportunities for filling the gap which you have pointed out must be evident to all.

G. FREDERICK WRIGHT.

OBERLIN COLLEGE, March 6, 1891.

Notes.

THE Society for Political Education, No. 330 Pearl Street, New York, announces for publication on March 16 'The Reader's Guide to Economic, Social, and Political Science.' The editors, Messrs. R. R. Bowker and George Iles, have been aided by twenty-six specialists in the preparation of their lists. The Guide will give titles of the most important and recent books, articles, and reports, with numerous descriptive and critical notes. The courses in economic and political science offered by the principal American colleges, for men and women, will be summarized, and courses of reading, elementary, intermediate, and advanced, will be prescribed. The Guide will contain 170 pages, whereas the pamphlet similar in aim published by the Society in 1880 had but 36 pages.

The American Academy of Political and Social Science, whose headquarters are in Philadelphia, announce in their report for 1890 that they will issue at an early date translations of the text of the Mexican Constitution by Prof. Moses of the University of California; of the French Constitution by Prof. Cohn of Harvard; of the Belgian by Francis B. Lee of Trenton; of the Prussian, etc. The fourth number of the Society's *Annals* will appear in April, completing the first volume of the Proceedings. Thereafter the Proceedings will be published bi-monthly instead of quarterly. The membership of the Society exceeds 1,600.

Announcement has already been made of the programme of the Spanish Academy for the celebration of the fourth centennial of the discovery of America. Additional action has just been taken by that body in the shape of a plan to publish an anthology of Spanish-American poetry and a *catalogue raisonné* of the most famous writers of the ancient Spanish possessions in the New World. The work is to be under the charge and at the expense of the Academy, and contributions to the proposed volumes are invited from the corresponding academies of South America. Special attention is to be given to the literature produced since independence of Spain. The Academy shrewdly announces beforehand that the anthology is not to extend beyond two quarto volumes; we fear that the work of reducing the vast bulk of Spanish-American poetry to that space will be as difficult as getting the genius of the 'Arabian Nights' back into the coffer again.

The Academy has also in hand the publication of the 'Cantigas de Santa María' of Don Alfonso el Sabio, based upon the codices of the Escorial, which have been scrupulously collated. It will be provided with an introduction and a glossary by the Marquis de Valmar, and will be of the greatest value to the student of the comparative philology of the Romance languages.

A popular ornithological work by John B. Grant, which involves the careful reproduction, by photography, of sixty-four of the more familiar birds of North America, with descriptive text, is in preparation by Charles Scribner's Sons.

Robert Clarke & Co., Cincinnati, will issue directly 'The Spanish Conspiracy: A Review of Early Spanish Movements in the Southwest, etc., etc.,' by Thomas Marshall Green.

'A History of the Sectional Struggle'—between North and South, namely—by Cicero W. Harris, to be comprised in an octavo volume of 600 pages, will be published by J. B. Lippincott Co., Philadelphia. The author's

references to authorities will be copious and exact.

Harper & Bros. will shortly publish 'A New England Nun, and Other Stories,' by Mary E. Wilkins.

'An American Girl in London,' by Miss Duncan, with illustrations by F. H. Townsend, is in the press of D. Appleton & Co.

Maj. Casati's work, 'Ten Years in Equatoria, and the Return with Emin Pasha,' which has just appeared in its Italian dress, will soon be published in English by F. Warne & Co.

John Wiley & Sons announce 'Ordnance and Gunnery,' by Capt. Henry Metcalfe, U. S. A.

A new and enlarged edition of J. Harrington Keene's 'Fly Fishing and Fly-Making for Trout' is about to be brought out by the *Forest and Stream* Publishing Company.

Charles L. Webster & Co. have engaged Mr. Blaine to oversee a chapter bringing Gen. Sherman's Memoirs down to date, and to add a personal tribute and a critique of the Memoirs.

'Dangers of the Apostolic Age,' by the Bishop of Manchester, and 'Life Story of Our Earth' and 'Life Story of Man' in the "Science Ladders" series, are to be published in this country by Thomas Whittaker.

A. Lovell & Co. announce Alarcon's 'El Final de Norma,' translated by Mrs. F. J. A. Darr.

Worthington Co. announce Ossip Schubin's 'Boris Lensky,' translated by Elise L. Lathrop; and E. Marlitt's 'A Brave Woman,' translated by Margaret P. Waterman.

E. P. Dutton & Co. have recently distributed among their employees a portion of the profits of the business during the past year. Instances of this commendable practice are, we believe, by no means common in the publishing business.

Mr. George Willis Cooke has brought the work of many Browning students to a head in his 'Guidebook to the Poetic and Dramatic Works of Robert Browning' (Boston: Houghton, Mifflin & Co.), which is a dictionary of the persons named in the poems, the poems themselves, their allusions, etc., arranged alphabetically. The way of the writer has been made easy for him by the works of Mrs. Sutherland Orr, Mr. Arthur Symons, the Publications of the Browning Society, etc., but he has been sufficiently patient and comprehensive to make an excellent encyclopædia of the sort of which Browning stands in need, and in the volume the student will find easily what he might have to search for in many other books. There is a bibliography of Browning literature in connection with the work and an index. Altogether, it is the most complete work of its kind yet issued, and may fairly be called a compendious Browning Library in itself.

Within the space of three years, Prof. Henry Drummond's episodical book of travels, 'Tropical Africa,' has got into a fourth edition, low-priced in order to be "popular" (Scribner & Welford). The work has already been reviewed by us at length, but we will recommend it afresh for its positive information and graphic descriptions, and for its humane spirit, which, manifested on behalf of the miserable victims of the slave trade, will also unconsciously elevate the mind of the reader.

The latest volume in the Camelot Series (London: Walter Scott; New York: A. Lovell & Co.) is a reprint of Darwin's classic work 'On the Structure and Distribution of Coral Reefs.' The handy and attractive volume is provided with a colored map, and Mr. Joseph W. Williams furnishes a brief introductory account of the origin of Darwin's theory of coral formation, and a candid and very useful summary of the present state of the question, which must be considered far from settled. Due notice is taken of the most recent American scientific observations and opinion.

'The Medical Annual' (New York: E. B. Treat & Co.) is an English epitome of the progress of medicine and the allied sciences. The volume before us, the eighth, bears date of January, 1890, and is thus one year behind the journals, but is probably as near to them as proper selection would warrant. The chapter on sanitary science contains statements on drainage, ventilation, and water supply well supported by authority, but which cannot be regarded as new. The whole is a convenient practical condensation, with the references to the originals generally noted.

The excretion of sugar characterizes two diseases, one of which, true diabetes, terminates in death after a slow career. Much study and experiment has been expended in searching for its essential nature and its proper treatment. The latest contribution to the subject is that of Dr. Emil Schnée of Carlsbad, in his book 'Diabetes: Its Cause and Permanent Cure,' translated by Dr. R. L. Tafel (London: H. K. Lewis). The author claims that the disease is distinctly curable, provided the physical changes have not passed the limit where mechanical restoration is possible. The report of cases appears to confirm that claim, and it would seem to be physicians' duty to go over this ground with care. The very pronounced use of the first person gives an unpleasant tone to the book, and, in one of our own race, would suggest doubt as to professional standing; but in this instance it seems a matter of taste rather than of intelligence. The translation is intelligible but not altogether smooth and idiomatic. We repeat that a sufficient presumption is established to warrant reinvestigation by the faculty of the causes and treatment of this grave disease.

Under the title 'Protective Philosophy,' Mr. David Hall Rice undertakes the defence of the "American protective system," as embodied in the McKinley Bill (Boston: Geo. B. Reed). The comparative effects of a high tariff and free trade are ingeniously established by two photographs, one showing the workers in a British linen mill, the other those in an American mill of similar character. A captious critic might object that the art of photography has not yet reached such perfection as to enable us to see causes; but unless some malignant free-trader should produce photographs of the workers in Austrian or Russian mills, we apprehend that Mr. Rice's method will be deemed conclusive by protectionists.

M. Gustave Brunet, the book-lover of Bordeaux, has just published a volume of 'Études sur la Reliure des Livres, et sur les Collections de Bibliophiles Célèbres' (Bordeaux: Vve. Moquet; New York: F. W. Christern). It is an amplification of a pamphlet published in 1873. Its chief value is as a supplement in some sort to the lists of books owned by famous collectors—M. Leroux de Lincy's catalogue of the Grolier library, for example, and certain of the briefer catalogues contained in M. Quentin Bauchart's 'Femmes Bibliophiles de la France.' M. Brunet is able to add nearly fifty titles of books owned by Grolier to the list of some three hundred and fifty contained in M. Leroux de Lincy's biography. Considering the present condition of the bookbinding art in Great Britain, it is curious to discover that British bookbinding was fashionable in France early in this century. Yet M. Brunet is unable to get Roger Payne's name right (p. 156); he calls him John.

In the *Nouvelle Revue* for February 1 is an article by Mlle. Marie Anne de Bovet on "Un Écrivain Cosmopolite: Henry James." To the readers of the elder *Revue des Deux Mondes* Mr. James's fiction had already and long ago been introduced by Mme. Th. Bentzon. In the Hetzel collection of translations, one of the latest volumes is 'La Sœur de Miss Ludington,' by Mr. Edward Bellamy, translated by R. Issam.

The twenty-seventh part of the new 'Stieler's Hand-Atlas' (Westermann) consists of maps of the German and the Chinese Empires and of India.

Dr. W. Junker contributes to *Petermann's Mitteilungen* a detailed account of the route between the Albert and Victoria Nyanzas followed by him in 1886. His purpose was to secure a passage through Unyoro and Uganda for Emin Pasha and his people, which failed because of a war then raging between the two countries. He refers to the great number and extent of papyrus swamps to be found on the banks of the streams. From the stems the natives construct floating bridges, or rafts when the streams are too wide and deep for bridging. He draws an attractive picture of Uganda, with its large and industrious population and its villages nestling in banana groves, with scattered farm-houses surrounded by cultivated fields. Not far from the capital he passed a hill which was crowned with a castle "just like ours," though built only of wood and straw.

In striking contrast to Dr. Junker's account of Uganda as it was five years ago is the report of Mr. Jackson, who visited that country in 1890 in the interests of the British East Africa Company. As a consequence of the persecution of the Christians and the civil wars, it has become a desert. "Rank vegetation covers the once fertile fields and groves. Dead bodies are lying about everywhere. All industry seems at a standstill. The people are mostly in a state of semi-starvation." Though the Christians are for the time in the ascendant, "the Mohammedans are collected on the borders of the country watching their opportunity to rush in and take possession." It is proposed, accordingly, to give up the idea of making Uganda the base of the company's operations on the lake, and to establish their headquarters in Usogo on the northeastern shore, and "one of the most desirable of the lake countries." With a summary of this report in the London *Times* is joined that of Capt. Lugard, another agent of the company, who was sent to explore the country between the coast and the lake, with a view to determining the route for the railway and to establish stations. "He found beds of rich iron ore, plumbago, and copper sulphate," and also mentions, "with great caution," the discovery of "crystalline quartz reefs similar to the gold-bearing reefs which he has seen elsewhere." Among other things which are being done to develop the country under the company's control, valuable timber trees from India are being set out in favorable places, and a number of Persians and Indians have been imported to start plantations of various kinds.

The February *Portfolio* (Macmillan) has a varied and readable table of contents. Mr. Walter Armstrong, with the aid of several plates and process cuts, justifies the recent appreciation of the paintings of Johannes Vermeer of Delft. Haddon Hall is redescribed and pictured, the letter-press being from the pen of Mr. John Leyland. Mr. Hamerton pursues his theme of "The Present State of the Fine Arts in France," devoting his second paper to "Painting; the Observation of Contem-

porary Life." He here talks very suggestively of the opportunities for the artist offered by the modern marvels of invention and industry, like the express-train, the steam-roller, the forge for armored ships, and the like; notes the drift towards subjects connected with surgery, chemistry, and anatomy; and discovers a democratic trait in the depicting of scenes from ordinary life, particularly in the humbler and more painful walks. Memoranda of certain of the paintings referred to serve in a rather crude way to point and enforce his remarks. In the March number the theme is "Various Effects of Modern Observation," and the moral, that when a modern French artist "has to make his choice between an artistic advantage on the one hand and some additional piquancy of human interest on the other, he will generally go where his public lead him." In other words, "in a very great number of modern pictures, art is sacrificed to mere fact." This is illustrated by the discussion of several well-known canvases of recent date, beginning with Brouillet's "Suzanne." Significant is Mr. Hamerton's comment on the contrast between Parisian public architecture and the paintings (open to the above criticism) chosen to decorate them.

A correspondent who writes to us from New England says: "The word 'lad,' though it has not been so strictly confined to the written language as the word 'wag,' has yet been unfamiliar to the mouths of all save a few superior persons who happened to be in a condescending mood. As Chauncey Wright used to say, 'lad' has been 'a boy with a man's hand on his head.' I have on this account noted with interest during the last few months a revival of the word among school-boys. 'Lad' is now not only in common use with them as a synonym of 'boy,' but the slang phrase 'Give a lad a chance' seems to have become a catch-word."

—*L'Art* (Macmillan) closed its last volume in December with a plaint. It had early in the year offered three prizes for etchings in as many classes, and had named a competent jury. To the disgust of the proprietors, but a single offering was made—a translation of Chaplin's "L'Age d'or," which has since been printed among the plates accompanying the new volume that marks the seventeenth year of this art journal. In the issue for January 1 one is met directly with the regrettable announcement that the state of M. Paul Leroi's health compels his retirement from the conduct of *L'Art*. He will carry with him undoubted respect for his zeal and devotion in his late office. At the same time the *Courrier de l'Art* of his founding will no longer accompany the main journal. Its publication is definitively abandoned, and in place of it the subscribers will be annually presented with a notable engraving. This year's is already distributed, and is a large and fine etching after Rosa Bonheur's well-known cattle-piece in the Luxembourg, "Labourage Nivernais." M. Leroi will be succeeded by and his work divided between two very capable men—Émile Molinier for the literary direction, and Théophile Chauvel for the artistic. The latest numbers to February 15 inclusive continue the retrospect of a "Century of Salonniers," with reviews of a number of holiday and illustrated publications. We may mention also the paper on the new-old castle of Vincigliata, near Florence, one of the greatest curiosities of that city, and a chapter on the mode of lighting ball-rooms and theatres in the eighteenth century, taken from Henry d'Allemagne's "Histoire du Luminaire." Both are furnished with interesting illustrations.

—The most interesting article in the February number of *La Réforme Sociale* is that entitled "A Travers la Russie: Observations Sociales et Impressions de Voyage," by M. A. Delaire. Had not the writer felt himself bound to account for Russia as a whole and describe the landscape, he would have had more space for his remarks on the condition of the factory hands, which is really his subject. In spite of his amateurishness, he sets forth clearly the fact that the absence of labor agitations in Russia is, in great part, due to the importance there accorded to religion and the family. The point is thoroughly well taken. At factories visited by him near Moscow and St. Petersburg, he found a form of family and communal life in the working-people's tenement-houses, which are admirably arranged for health. According to the Russian law, women cannot be employed between the hours of nine P. M. and five A. M. Young lads of fifteen to seventeen are subject to the same regulations. No children under twelve years of age can be employed. From twelve to fifteen, they may work eight hours a day, in stints of four hours, with an interval of four hours for rest. The women work eight hours, generally, or nine hours, in two stints. In St. Petersburg, the drinking-saloons are successfully opposed by free lectures and classes in church singing, which are thronged. The object of M. Delaire's article is to encourage Frenchmen to employ with profit their money and talents in the creation of manufactures in Russia, in emulation of those of his countrymen who have already reaped a rich harvest by so doing. He ends with a word of warning to France, exhorting her to avert impending peril by practising the virtues worthy of a free people, and to strengthen the foundations of prosperity, as in Russia and the United States, by recognition of the principles indispensable to prosperity—the law of God and the authority of the father, religion, and family.

—Out of 150 pages of W. M. Rossetti's edition of Shelley's 'Adonais' for the Clarendon Press Series (Macmillan), only 25 are occupied with the poem; the rest consists of memoirs of Shelley and Keats, separate essays on the composition and bibliography of the poem, its argument, and a general exposition, and notices of Bion and Moschus, together with over fifty pages of notes in fine print. This is the first work of Shelley to be submitted to such minute treatment, and it is not surprising to find that the editor often has occasion to remark upon inconsistencies in the imagery, irregularities of grammar, and obscurities of all sorts. Shelley was a poet full of faults of expression, and they are of the kind that grow greater the more they are attended to; but we were not prepared for the Procrustean rigor of some of Mr. Rossetti's criticism. Not infrequently we find notes which seem to us puerile; as, for example, on "Grief made the young spring wild," it is said that this "may be taken as implying that Shelley supposed Keats to have died in spring, but in fact he died in the winter—23 February;" and similarly, on "For whom should she have waked the sullen year," it is questioned whether "the year" began with January 1 or March 23. Worse even are the following: on "the mountain shepherds," we read—"As the shepherds do not belong to the low country, so neither do the poets to the flats of verse"; again, on "Ever at thy season be thou free to spill the venom," we read "*at thy season* can be understood as a reference to the periodical issues of the *Quarterly Review*." In more serious points, the ineptitude of the editor's comments on Shelley's science is especially remarkable, but one instance must suffice; on "The golden day had left the earth a corpse," he says that Shelley "takes no account of the fact that the sun when it ceases to illumine one part of the earth is shining upon another part." This is not enlightening criticism. Occasionally the editor has, in our judgment, missed the meaning. The "daring hyperbole" in the phrase "Death blushed to annihilation" is suggested probably by the faint hue of life revisiting the face as "the breath" revisited the lips, but it is treated as if no simple explanation were possible. In stanza 29 the notion that Shelley means that a new genius "appears to contemporaries to throw preceding poets into obscurity" is without good ground; the antithesis is between the sun and the reptile or insect life—the latter die, the former [*i. e.*, the poet] becomes a star in the night of death, with its "kindred lamps." No doubt the imagery in this passage is very confused, but it is in Shelley's usual manner. We have cited more instances than ordinarily because of Mr. Rossetti's distinction as a Shelley scholar; but it is a disappointment to find him least successful in this labor of minute exposition. The volume is very prettily bound and admirably printed.

—A second volume of Brugmann's 'Comparative Grammar of the Indo-Germanic Languages' has appeared in English translation (Westermann & Co.), and we are pleased to notice in the matter of the English idiom a decided advance over the first volume, whose abundant barbarisms gave us in an earlier number opportunity for criticism. The translation of the present volume is the joint work of Mr. Conway and Mr. Rouse, both Fellows of Cambridge colleges, and has been done with extraordinary care and self-consistency. A serious effort has been made to determine and establish a system of appropriate English equivalents for the technical nomenclature of the science—no easy thing to accomplish, inasmuch as the science, being almost exclusively German in its origin, has developed a German rather than a cosmopolitan nomenclature. The adoption of such terms as "proethnic" (*ur-*), "pre"-Greek (*vorgriechisch*), "fertile" (*produktiv*), "extended" (*erweitert*), "epithetised" (*mutiert* for compounds like *baldhead*, *greatheart*), "analogical," "thematic," etc., will meet with general approval. Whether the final naturalization of "ablaut," "umlaut," "grundform," and "Indo-Germanic" will be accepted with equal readiness seems to us questionable. *Ablaut* and *umlaut* have, to be sure, the advantage of being confined to an exclusively technical use, but *gradation* and *mutation* are truer. *Indo-Germanic* is less familiar to Englishmen and Americans than *Indo-European*, and by Frenchmen can never be viewed but with abhorrence. *Aryan*, which is still preferred by ethnologists, is better than either, but is unfortunately appropriated by most German linguists to the value *Indo-Iranian*.

—Prof. Arnold Brass of Marburg has just published a volume entitled 'Die niedrigsten Lebewesen' (Leipzig: Thieme), which, in view of the universal interest excited by Dr. Koch's bacteriological researches and his recent discovery of the bacillus of tuberculosis, may be regarded as a very timely work. It is a clear and comprehensive presentation of the subject, attractive in style and combining scientific accuracy with perfect intelligibility to the ordinary reader. The text is also illustrated by nearly seventy excellent woodcuts. It is divided into three sections, of which the first

and most important treats of "Spaltpilze," the second of vegetable micro-organisms, and the third of animal micro-organisms. The "Spaltpilze," which he subdivides into four groups, are exceedingly varied in form and function, and comprise some of the most active friends as well as the most destructive foes of the human race. They are the producers of fermentation and putrefaction, and, were it not for their ceaseless activity, there would be no beer nor cheese, no wine nor leavened bread; the refuse of vegetation and the dead bodies of men and animals, instead of decaying and disappearing as dust, would dry up and harden, and the earth would be encumbered with innumerable and imperishable mummies. But if they are necessary co-workers with man in his industrial enterprises and sanitary regulations, they are not less efficient as pathogenic agents or generators of disease. Prof. Brass gives an interesting account of the methods of studying bacteria, the processes of "pure culture," the means employed to color these delicate and transparent organisms with aniline colors, of which they are remarkably fond, in order to render them more easily observable, and the application of photography to the same end. The work deserves to be translated and disseminated as a valuable contribution to public hygiene.

—Mr. James Terry has published a monograph upon certain "Sculptured Anthropoid Ape Heads" found in or near the Valley of John Day River, one of which is in his collection, another is the property of Professor O. C. Marsh, while the third is owned in Oregon. They are described as being carved from bowlders of basaltic rock; and the resemblance, more or less close, which they bear to the apes, leads Mr. Terry to the conclusion "either that the animals which these carvings represent once existed in the Columbia Valley, or that, in the remote past, a migration of natives from some region containing these monkeys reached this valley, and left one of the vivid impressions of their former surroundings" in these sculptures. This explanation may be correct, but the facts do not prove it any more than the statement of Major Long, that an Omaha Indian "attributed to an animal from which he received his medicine the form and features of the elephant," proves that elephants formerly lived in the valley of the Missouri, or that the tribe had migrated from a region where these animals abounded. As a matter of fact, there is another explanation; and without wishing to insist upon its truth, we may be permitted to suggest that these carvings may have been made at any time during the past century by a white man, or by some Indian who had seen a monkey or a picture of one. There is nothing impossible in the idea, and it acquires a certain plausibility from the fact that these specimens are surface finds, and, hence, must be classed as recent until proved otherwise.

A SENATOR OF THE FIRST CONGRESS.

Journal of William Maclay, United States Senator from Pennsylvania, 1789–1791. Edited by Edgar S. Maclay, A.M. D. Appleton & Co. 1890.

In order to estimate this Journal at its true value, we must form to ourselves some proper conception of the character and peculiarities of the writer. We may say, then, that William Maclay seems to have been a man of acute intellect, well trained in the logic of the bar; constitutionally simple in his habits and in matters of taste invincibly opposed to the very appearance of artificiality; inflexible in his social convictions and political principles; narrow in the range of his sympathies, and therefore inclined to be suspicious in the judgments he formed concerning the motives and actions of men; naturally endowed with a sub-acid temper, and therefore easily stirred into irritability by the contacts of public life. He was, besides, a confirmed valetudinarian, doomed to coddle his rheumatic joints with anxious solicitudes, and diverted from his daily chronicle of political fault-finding only to register his twinges of personal pain, and record specifics for rheumatism compiled from Buchan's 'Family Physician' and the quack advertisements which met his eye.

We must also consider the psychological effect which is likely to be produced in certain minds by the mere fact of keeping a diary, whether for the writer's eye alone or with a view to ultimate publication. Large and wholesome natures like Walter Scott may keep a daily chronicle of thoughts and observations without betraying any side on which their minds are unequally weighted, because they hold their minds under even command; but if there be any want or excess in the balance and proportion of a diarist's mental constitution, it is sure to be disclosed and to be intensified by the constant repercussion with which the pen will return to certain topics according to the points of view which give a predominant outlook to the writer's observations. The 'Mémoires' of Saint-Simon not only show what an acute observer he was, drawing shrewd inferences from looks, tones, and gestures, but also show how this critical acumen of his was sharpened by long practice. The diary of Brainerd not only shows how sensitive he was to "the plague of his heart," but how that sensitiveness grew morbid and became a running sore under the irritation of daily self-analysis. The same monochromatic tone is perceivable in books of confessions, whether written by a St. Augustine to crucify sinful affections and lusts, or by a Rousseau to glorify the naïveté of his sentimental naturalism. Self-performed autopsies, like those of Bunyan in his 'Grace Abounding,' of Lamennais in his 'Paroles d'un Croyant,' of even Newman in his 'Apologia,' must all fall under the same condemnation so far as they fall under the same category. And as in religion so in politics. Few are the benignant bosoms in which the fires of patriotism are seen to blaze with the pure white flame which burns its own smoke. The public man who, fresh from the fervors of debate, hastens to commit his burning words to a diary, is pretty sure to leave the smell of smoke on his manuscript. The diary may even serve as a chafing-dish, for as he muses, pen in hand, the fire will burn afresh, and we may count him happy if, with the *esprit d'escalier* coming to his aid and comfort, he can resist the temptation to make it hotter for his adversaries on paper than in the actual war of words. In the diary of John Quincy Adams, ardent patriot and good hater as he was, we fancy that we can often detect the traces of the nitric acid which dripped so easily from his tongue and pen. In the Journal of Maclay, ardent Republican and good hater as he was, the odor of "sweltered venom" is as pervasive as it is pungent.

In further explanation of the "snip-snap and contradiction" (as Maclay phrases it) which keep up a constant reverberation in this Journal, like fire-crackers exploding in a barrel, we must bethink ourselves of the temper of the times in which this determined anti-Federalist was called to act and write. The new Government of the United States had just been framed under the Constitution, after a critical period of unparalleled confusion, doubt, and apprehension. The Constitution, with its new form of polity, instead of relieving the public mind from this state of tension, had as yet only added a new element of doubt and apprehension to make the confusion worse confounded. Maclay was of those who shared in all the fears begotten by the enlarged powers delegated under the Constitution to the general Government. The fierce champion of State-rights, he was perpetually startled from his propriety by the spectre of "Monarchy." And so it naturally came to pass that when this unbending Republican entered the Senate of the United States in 1789, filled with all the apprehensions of the hour, he was strict and quick to mark every symptom, whether in debate, ceremonial, or public life, which seemed to him of evil augury for the simplicity of American politics. As the Senate held its sessions in secret, and as the writer kept his Journal for private inspection alone, he was left perfectly free to give full license to his pen, not only for the purpose of jotting down his observations, but also for the purpose of giving form and pressure to every dubious impression and flitting suspicion that crossed his mind. We have, therefore, a complete spectrum of his mind exhibited in lines which enable us to know the writer *intus et in cute*.

So suspicious of the new Constitution that his soul often "revolts" against it, lest it may "turn out the vilest of all traps that ever was set to ensnare the freedom of an unsuspecting people"; so suspicious of men that he is always prone to divine some sinister motive at the bottom of human actions; such a hard-hitter in debate that his hand is against every man, and yet so touchy in his sensibilities that he complains of slights received from friends and enemies; so controversial in his temper that he sometimes mingles in debate for "pastime," and sometimes purely for practice in the art of dialectics; so critical in his judgments that nearly everybody is made to smart under his lash, yet sometimes wondering why it is that men in Congress "keep him at a kind of guarded distance that seems to preclude sociability"; so minute and penetrating in his own observations that he tries to discern the secret thoughts of men behind the veil of their words and acts, yet so frank in his own self-revelations that he tells us, without a blush for his social ethics, how he "pared his nails" in open Senate, and how he tried to buy two votes for Harrisburg as the site of the Federal city; so secluded and simple in his tastes that he lived in the retirement of a New York boarding-house, at the rate of $2 a week, yet so self-conscious that he not only marks the neglect in which he is left by the diplomatic corps and by "people of *ton* in the city," but shows that he felt it by recording that he "did not care a fig for it"—this stalwart champion of pure and simple democracy was, we see at once, a born *Frondeur* who never felt so much at home as when he was in the ranks of the political opposition. Confessing himself without charity enough to believe that the prevailing party in the Senate could be composed of honest men, he now exclaims, "Lord, deliver us from rascals!" and now ejaculates, "O, sweet candor, when wilt thou quit the cottage and the lisping infant's lips, and shed thy glory around the statesman's head?"

In view of this constitutional censoriousness, it is no great surprise to learn that certain people, at the close of his two years' term, were minded, as he says, to have him out of the Senate, "even if they should put the devil in his place." Nobody questioned his inflexible

Republicanism. It was only his political pessimism that soured the minds of men against him. But the same porcupine quills which a hundred years ago made him an uncomfortable companion in the Senatorial family of that day do but make his diary the more piquant and poignant now that their sharp points draw no blood.

At first it would seem that the figure of Washington loomed before his eyes with a genuine nimbus around the head of "the first character in the world," but the nimbus soon began to fade. Little awkwardnesses came at the outset to make "the great man" seem ridiculous, as when, in state ceremonials, he was seen to stumble and fumble while acting what seemed to Maclay the part of a posture-master, or as when, at state dinners, the President, in intervals of silence between the courses, "played on the table with a fork or knife, like a drumstick." A little later Maclay began to suspect that Washington was symbolizing with the men who favored the establishment of a "splendid court" around the Presidential office. Next he suspects that "His Elective Highness" is courting the House of Representatives in order to depress the Senate and exalt the prerogatives of the Executive. So he hints that Washington, in the use of patronage, was acting the part of Walpole, and after adding that "Walpole was a villain," what, he whispers to his Journal, "must be the man who follows Walpole's footsteps"? The "fine gold" in the world's "first character" soon becomes "dim," until, in the end, smitten with disgust at the pomp and circumstance of a Presidential levee, the diarist records a fervent wish that "Washington were in heaven!" After this the President comes in for heaviest reproach as "the constant cover to every unconstitutional and unrepublican act," and is finally flouted as having become, in the hands of Alexander Hamilton, "the dishclout of every dirty speculation, because his name goes to wipe away blame and silence all murmuring." When Maclay comes to write down his final verdict concerning our first President, the record seems to have been so disparaging that the leaf of the diary containing it has been torn out.

Richard Henry Lee, Oliver Ellsworth, and Alexander Hamilton hold a particularly bad eminence in the pages of this Journal. Lee is painted as the "Ishmael of the Senate"; as the leader in futile discussion for titles and for all the fooleries, fopperies, fineries, and pomp of royal etiquette; as combining great practice in public business with a factious and restless disposition; and, finally, as seeming to do his best to destroy the Constitution (to which he had been opposed) by overloading it with alien forms and usages. He says that Lee was believed to be "the worst of men" till Pierce Butler of South Carolina entered the Senate and became *facile princeps* as the marplot of debate.

It was to be expected that an ardent Federalist like Oliver Ellsworth, the framer of the Judiciary Act, would incur the special odium of an ardent Republican like Maclay. From the first, Maclay expresses a doubt whether Ellsworth is a man to be trusted. He is described as being tainted with monarchical notions; as being "the most conceited man in the world"; as believing that he could carry anything by sheer force of pertinacity, and by a prolixity of tongue which procured for him the epithet of "Endless Ellsworth"; as a "bare-faced supporter" of the Administration in all its measures; as ready to "varnish over villany and give effect to roguery without license"; as a man of ability, but "without a particle of principle"; as gifted with much argumentative dexterity, but a poor draftsman of statutes, who sometimes could not even spell correctly. Yet Maclay recognizes in Ellsworth a political foeman worthy of his steel, and records with evident gusto an occasion when, as he thought, he got a "hard hit" at the Connecticut partisan.

Alexander Hamilton is, of course, put in a pillory and pelted with every variety of injurious epithet. It is predicted that the Funding System will "damn his character as a Minister." It is charged that he was a base buyer of votes; that he used the Cincinnati Society as his political machine; that he converted the mercantilism of New York city into an engine of administration, until at last the city deserved to be called "Hamiltonopolis"; that he kept a crew of stipendiary servitors in the House of Representatives, and owned a troop of "gladiators" in the Senate who were ever ready to fight for their master; that a majority of the Senate were "sold" to him because he had "bought" them, and that he showed economy in not paying more for votes on sale than he found to be necessary. In a word, the writer sets down Hamilton as a "damnable villain."

But after all these poisoned arrows have been discharged from Maclay's full quiver, it is John Adams, "Bonny Johnny Adams," who must be accepted as the favorite quarry of our Republican archer. The language of the writer seems to labor for the invention of words that shall be adequate to express the aversion and contempt with which he is inspired by the bearing, manner, words, and acts of the first Vice-President of the United States. His alleged fussiness, his fidgetiness, his peevishness, his pedagogical imperiousness, his fondness for trifles, his supreme delight in questions of etiquette, his mania for nobility, his insufferable loquacity, his vacant laugh, his unmeaning simper, his egregious egotism are all held up for constant ridicule in the pages of this Journal. There are times when the chronicler can no longer contain himself as he recalls the demeanor of his *bête noire*, and he exclaims, "O, Adams, Adams, what a wretch art thou!" It is recorded with surprise that on one occasion, when the Vice-President had the casting vote, he actually voted right—that is, he voted with Maclay. Ordinarily the writer complains that the Vice-President "affected to treat him with all the neglect he could." The following excerpt from the Journal, under date of May 11, 1789, will suffice as a specimen of Maclay's antipathy for "Bonny Johnny Adams":

"Mr. Izard and sundry gentlemen of the Senate [are] dissatisfied with our Vice-President. He takes on him to school the members from the chair. His grasping after titles has been observed by everybody. Mr. Izard, after describing his air, manner, deportment, and personal figure in the chair, concluded with applying the title of *Rotundity* to him. I have really often looked at him with surprise mingled with contempt when he is in the chair, and no business before the Senate. Instead of that sedate, easy air which I would have him possess, he will look on one side, then on the other, then down on the knees of his breeches, then dimple his visage with the most silly kind of half smile which I cannot well express in English. The Scotch-Irish have a word that hits it exactly—*smudging*. God forgive me for the vile thought, but I cannot help thinking of a monkey just put into breeches when I saw him betray such evident marks of self-conceit."

The Journal, however, has a solid value apart from these vivacities of expression and this impressionist style of portraiture. As has been already intimated, the very age if not the body of the time in which it was written, can here be found with its sharp sectional contrasts and its bitter political antagonisms. The Pennsylvania Senator confesses to a special hatred for New England, and intimates that "honesty throve badly east of the Hudson." Sometimes, indeed, the record of cabals and intrigues is relieved for a moment by a pleasant picture of the first Senators gathered together in "chatting parties about the fires and stoves," but such glimpses are only for a moment. The scene soon shifts to some company of Senators and Representatives, inside or outside of the halls of Congress, where "the nether jaw of Clymer is seen shaking with convulsive motions, like a goose nearly strangled in the act of deglutition"; where Benson of New York "bungles like a shoemaker who has lost his end"; where Fisher Ames raises aloft "his hippocratic aspect"; where Elbridge Gerry exhibits the advantage of having "a cadaverous appearance," because he looked so bad that he "ran no risk of deterioration"; where Boudinot's wrinkles "rose in ridges," while the angles of his mouth "assumed a curve resembling [that of] a horse's shoe"; where "Hamilton's group," assembled at a public funeral, "are pricking up their ears and Speculation is wiping a tear from either eye"; where Read of Delaware "is swinging on his legs for an hour or more," in tiresome speechification; where Gouverneur Morris, "half pimp and half envoy," is portrayed as a political eavesdropper at the English Court; where Gen. Schuyler is whistled down the wind as "the supple-jack of his son-in-law, Hamilton"; where the courtly visage of Rufus King is described as "a perfect canvas for the devil to paint on"; where the respectable John Jay, seated at the dinner-table of Washington, "tries to make a laugh" by retailing a *scabreux* anecdote, or where the whole Pennsylvania delegation, assembled at mess-table, are making the air feculent with "bestial badney."

It will be seen at a glance that there is a certain picturesque exaggeration and a large dash of Rabelaisian humor in such grotesque characterizations as these. Yet we have no doubt that the writer was perfectly sincere when, at the close of his term and in full prospect of his failure to be reëlected, he made a minute that the First Congress of the United States "deserved to be d——d."

If it shall seem strange that we have bestowed so much attention on the acrid personalities which abound in this Journal, we have only to remark that it is these hot-spiced condiments which give to the present publication its only original flavor. The substantial contents of the diary, with the expurgation of its invidious flings, were published some ten years ago—in a very inadequate form, it is true, yet with the addition of much illustrative material drawn from contemporary sources. The editor of this new recension tells us in the preface that "great care has been taken to give the present publication word for word from the original manuscript, even to the [mis]spelling of proper names." But the transcription of the manuscript for the press has, we fear, been very carelessly made. The text swarms with mistakes which are apparently the fault of the copyist rather than of the printer, as, for instance, when we read "delated" (p. 239) for dilated, "Nousee" (p. 261) for Nourse, "impart" (p. 348) for import, "part notes" (p. 350) for post notes, "protect" (p. 353) for protract, "Governor Clarton" (p. 194) for Governor Clinton, etc., etc., etc. We are glad, however, that the editor has not cumbered the text with many explanatory notes, for the few that he

risks are often misleading. Macfay, for example, refers again and again to "Jackson of the President's family." The editor informs us in repeated foot-notes that by this descriptive designation ("the President's family") the diarist meant to characterize "a supporter of the measures adopted by the Administration." Major Jackson, we need not say, was Washington's military aide, and resided in the President's family as his private secretary, sharing this office with Tobias Lear. The index of the book is wofully defective.

JULES BRETON.

The Life of an Artist. An Autobiography. By Jules Breton. Translated by Mary J. Serrano. D. Appleton & Co. 1890.

Jules Breton, as is well known, has some pretensions to rank as poet as well as painter, and his autobiography certainly shows some sides of the poetic temperament. He tells us that it was written because his physicians had forbidden him further indulgence in the composition of poetry, from the excitement of which he had "contracted a nervous affection of the brain, accompanied by vertigoes which resembled trances, and lasted for hours." He took up poetry late in life, and prose still later, and it is perhaps natural that his prose should show strongly the effect of his poetical work. At any rate, his 'Life' is distinctly lyrical rather than historical. It opens with a rhapsody on childhood and closes with a pæan on the Universal Exposition. Where another would say, "I was born on such a day at such a place," Breton says: "The Garden of Delight, the cradle of Adam, we have all dwelt in it," and so on for two pages. More than a hundred of the three hundred and fifty pages of the volume are devoted to reminiscences of his childhood, filled with descriptions and "impressions," but only giving dates or facts by indirection and, as it were, accidentally, and in a "poetical prose" which may sound better in French, but is somewhat fatiguing in English.

He might well, however, excuse the lack of straightforward narration in the words of "The Needy Knife-Grinder": "Story, God bless you, I have none to tell, sir." He was born (although he does not say so) in 1827, in the village of Courrières, Pas de Calais, of a good bourgeois family, his father being land steward of the Duke of Durcas and the *gros bonnet* of the village, always addressed as "Monsieur Breton" by the villagers. His mother died when he was very young, and he and his brothers were instructed by their uncle. He was sent to school (in 1837?) at a small seminary near his home, where he was unhappy, and in 1840 was removed to the College of Douai, where he spent three years. In 1843 he began the serious study of art in Ghent as a pupil of Félix de Vigne, whose daughter he afterwards married, and he went to Paris and entered the studio of Drolling in 1847. Henner and Baudry were among his fellow-students. Drolling thought him a dull and rebellious pupil, and there is a legend, which Breton does not confirm, that his master advised him to give up the study of art altogether. He first exhibited in the Salon of 1849, and although, after the fashion of poets, he takes his fits of the blues very seriously, his success seems to have been more than usually rapid. He was medalled in 1855, and his "Blessing the Grain" of 1857 and "Gleaners" of 1859 were purchased by the Government for the Gallery of the Luxembourg. Since then his success, artistic and commercial, has steadily grown to its present proportions.

In the later part of the volume there are a good many reminiscences of the great painters with whom he came in contact, not generally very important in themselves, but interesting nevertheless, and a good many criticisms of their works. His admiration of Corot is hearty and intense, but towards the others he manages to assume a slightly patronizing air which is sometimes a little amusing. He finds Millet's "Sower" "black" and "declamatory," and says of Baudry: "He leaves behind him one of the greatest names of our school — a name, however, which, in my opinion, would have been still greater if he had never left France." Apparently he would have had Baudry, like himself, paint peasants; yet for those who did so he has even less praise. He considers himself, not without some reason, the discoverer of *plein air*, and his judgment of Courbet is harsh, while for "those curiosities in yellow and violet of artists who seem to think they have a monopoly of atmosphere," he has a bitter contempt. His own family, on the contrary, would seem to have been as remarkable as Carlyle's: father and uncle and brothers are all remarkable people, while the talent of his daughter fills him with delight. Great talent was also possessed by the artists who died young and obscure; and "poor" this and "poor" that receive hearty praise.

Another side of the poetic temperament is shown in the story, on page 205, of his anxiety about the effect of his first Salon picture. (He already knew that it was accepted.) "This state of anxious suspense," he says, "lasted six entire weeks! And when I say that during all this time I did not sleep, it is not a figure of speech. *I did not sleep for a single instant.*" This is certainly a remarkable and well-nigh incredible degree of susceptibility, even for a poet.

The most valuable and interesting part of the book is some fifteen pages of extracts from Breton's note-books, which embody his doctrine and opinions on art. It is liberally sprinkled with exclamation points and capitals, and much of it is more sounding than profound, but it carries the weight of his considerable authority, and may do good. His practical advice as to method in beginning and carrying on a picture (pp. 295, 296) is sound and excellent, and his remarks on the nature of true idealism (p. 293) are so just and so worthy the attention of artists and critics alike that we quote them in full:

"For how, in truth, does the painter succeed in expressing the Beautiful? Is it by deliberately correcting the faults of the model who is posing for him? No; he could only make this correction by virtue of a system, and experience demonstrates that *every system in art irrevocably leads to coldness, to death.*

"Nature, then, is not to be corrected by making it conform to a conventional type. The artist must have the intention of rendering what he sees and conceives as he sees and conceives it.

"His exaltation of feeling will make him discern the *line of expression*, of beauty, which he will follow, and *unconsciously* he will diminish or eliminate the useless details which interfere with it."

This is the pure truth—*la vérité vraie*—and of itself an all-sufficient reason for the book's existence. The italics are ours.

In attempting to estimate the place that Jules Breton will ultimately hold in the history of modern art, one must guard against either underrating or overrating him. The great vogue he enjoys to-day, and the enormous prices some of his works have fetched in the market, might incline one to place him with Millet as one of the very great masters of rural genre. Certainly this would be a mistake. The elements of Millet's greatness—his epic grandeur, his austere simplicity, his sureness of characterization and mastery of form and action, his sober yet rich and powerful coloration—are replaced in Breton by a slightly cloying sentimentalism, a somewhat awkward and unlearned draughtsmanship, and a coloring agreeable but hardly either exquisite or profound. But while his present reputation is unquestionably exaggerated, he who should deny Breton's right to a most honorable place in contemporary art would be at fault. Such a place he has earned, and such a place he will hold, by priority if by no other title. His early pictures, "Blessing the Grain" (1857) and "The Gleaners" (1859), were among the very first attempts at the painting of the human figure out of doors and in its proper relations with the landscape. They were most remarkable productions for the time, and remain his most remarkable works. The first of these, though lamentable in drawing, expresses the all-pervading glow of midsummer sunlight — light not merely striking *on*, but circulating *around*, all objects and filling the whole air—in a manner quite wonderful. The other is a twilight effect—the light is sombre rather than brilliant —but the same justness of vision, the same study of the figure as a part of out-of-door nature rather than as a separate entity, is its distinguishing characteristic. And this quality was then very new in art. The great landscape-painters of France were then producing their masterpieces, Millet was then at his best (his "Gleaners" is of the same date with the "Blessing the Grain"); but the landscape-painters did not treat the figure, and Millet rarely painted from nature. The beginning of the accurate study of open-air effects upon the human figure may more fairly be attributed to Breton than to any other one man.

He has rarely equalled this early work. What he has gained in correctness of draughtsmanship he has more than lost in warmth and fulness of coloring and in directness and simplicity of impression. Many of those works which have astonished the world by the prices they have brought at auction sales, owe their popularity to a prettily artificial sentiment which is at the antipodes of the frank genuineness of his earlier work. Only once has he reached his earlier level—in the "Evening in Finisterre"—and that once he has very nearly produced a masterpiece. While he has rested stationary or retrograded, others have still advanced, and the study of *plein air* has been carried to lengths that he has never understood. He has fallen behind the procession, but we must not let his fretful and querulous criticism of all those who have not been contented to stop where he stopped make us forget that he was once a leader.

The translation is capable, on the whole, though marred, in common with most translations from the French, by an abuse of the historical present, and in spite of one or two evident blunders, such as "brewery" for *brasserie* (p. 274). A most extraordinary misprint on page 284 makes the author speak of the "*timid* muscles" of some of the figures of Rubens, where "tumid" was evidently meant. There is no sign either of index or table of contents.

BOOKS ABOUT THE STAGE.

Thomas Betterton. By Robert W. Lowe. [Eminent Actors, edited by William Archer.] Longmans, Green & Co.

Émile Augier. Par Hippolyte Parigot. Paris: Lecène, Oudin & Cie. New York: F. W. Christern.

L'Art Théâtral. Par Samson. Paris: Dentu. New York: F. W. Christern.

History of the American Theatre During the Revolution and After, 1774–1792. By George O. Seilhamer. Philadelphia: Globe Printing House.

Familiar Chats with the Queens of the Stage. By Alan Dale. G. W. Dillingham.

Mr. William Archer, in his 'Life of Macready,' the first volume of the series of "Eminent Actors," had set so high a standard of excellence that the task of those whom he had chosen to write the succeeding biographies became doubly difficult; but Mr. Robert W. Lowe has written a life of Betterton which bears the comparison bravely. The one fault which one might fairly find with it is, that it is perhaps quite as much a history of the English stage during the Restoration as a biography of the leading actor of the time; but this is hardly a demerit when it results in an account of the Restoration playhouse as exact, elaborate, and admirable as that which fills Mr. Lowe's second chapter. This description brings before us, as no other has ever done before, the physical conditions of the theatre in which the comedies of Congreve, Wycherley, Farquhar, and Vanbrugh were originally produced, and the many dramas of the greater Dryden brought out with varying success. These conditions have a far greater influence on the dramatic literature of the time than mere literary critics can ever understand. Mr. Lowe makes clear to us, and clearer than ever, the arrangement of the stage, projecting as it did well into the pit, the scenic possibilities, the means of advertising, and the hours of performance. This chapter of his is worthy of comparison with the reconstruction of the stage of Molière and Racine to be found in Eugène Despois's 'Théâtre Français sous Louis XIV.,' one of the best books of its kind ever written.

Mr. Lowe has traced Betterton's career on the stage with the same minute knowledge of the details of theatrical history as made his 'Theatrical Bibliography' invaluable, and with the same conscientious care that he brought to the editing of Dr. Doran's 'Annals' and Colley Cibber's 'Apology.' For many a date and many a piquant touch Mr. Lowe draws on Pepys's Diary, but for the most brilliant theatrical portraiture ever attempted he quotes freely from Cibber. Aston and Downes and Davies supply apt anecdotes; and criticism rich in personal revelation is taken freely from the *Tatler* of Steele. There is, of course, a list of the parts played by Betterton; and the biography has an index—an appendage needful, and yet not often found, in the recent British biographical series.

The late Émile Augier was, perhaps, the most manly and most wholesome French dramatist of this century, and he was part author of "Le Gendre de M. Poirier," probably the finest French comedy since the "Mariage de Figaro"; but none the less does it seem somewhat hasty to include the first biography published within a year after his death in a series of "Classiques Populaires." This is what M. Parigot has done, and in his preface he endeavors to justify his course, and not without a fair measure of success. His biography of the author of "L'Aventurière" is inspired by hearty admiration; and still he makes scarcely any claims for Augier that any calm and competent critic of the French drama of this century would not be ready to grant. The few facts of Augier's simple career are given simply; there is frequent quotation from the essays of other writers and from the best contemporary criticism; and there is ample excerpting from Augier's works, as was prescribed by the plan of this series of "Classiques Populaires." M. Parigot's style lacks the relief of M. Léopold Lacour's, and to M. Lacour we owe, perhaps, the most acute analysis of Augier's plays. M. Parigot's own criticism is rather literary than dramatic. But his sketch is to be welcomed by all who know how clean-minded, quick-witted, and keen-sighted Augier was, and how great his service was to the French stage. The biography contains half-a-dozen doubtful woodcuts, shockingly ill-printed.

That Samson was a classicist, at least, if not a classic, no one could ever doubt; and when he wrote about his art, he modelled himself on the "Ars Poetica" of Horace and the "Art Poétique" of Boileau. Hence we have in his 'Art Théâtral' an essay as full of quotable truths as Pope's "Essay on Criticism," and, like it, cast in a form now outworn. Samson's poem is perhaps known to English readers only from the chance quotations in Lewes's 'Actors and Acting,' for it has long been out of print and very hard to find. In the present edition there is a complimentary letter of Augier's and a most interesting introduction by M. Coquelin, containing not only a few pleasant personal anecdotes, but a careful study of Samson's ability as an actor, reader, and teacher. Samson was an instructor whose fame was surpassed by that of one of his pupils; Rachel was no mere Fotheringay nor was Samson a "Little Bows," but he it was who showed her how to get the utmost from herself. Rachel used to say that she owed him everything; and M. Coquelin notes that she made but half-successes in the characters she first acted during any of her frequent quarrels with Samson. The quotations which M. Coquelin makes in his preface from the poem he is introducing are sufficient to prove that, although didactic verse on æsthetics is hard reading nowadays, the game is worth the candle.

Mr. Seilhamer's laboriously compiled 'History of the American Theatre' has now a second volume, devoted to the stage during the Revolution, and covering the years from 1774 to 1792. It is very like the first in its merits and in its demerits. It contains a mass of new material most carefully collected, and much of it now used for the first time. It corrects the errors of Dunlap and of those who followed him, including that most cautious of chroniclers, Mr. Joseph N. Ireland. It quotes an abundance of most interesting prologues and occasional addresses. It prints the casts of every important play, and it gives comparative casts—a most useful feature for any one who wishes to trace the rise of an actor. It gives a list of the parts played by almost every performer of even second rank. It cites freely cards, advertisements, and criticisms from newspapers, and also the epistolary critiques frequent in eighteenth-century journalism.

The one great blemish of Mr. Seilhamer's useful book is his constant girding at Dunlap, who blundered often enough, no doubt, partly because he relied on Hallam, and partly because he had not the virtue of Dryasdust research. But none the less is Dunlap's 'History of the American Theatre' a useful and an interesting book. Dunlap modelled his work on Colley Cibber's, and not without a certain success. It is readable to this day, for he had a literary tincture, and this Mr. Seilhamer, with all his industry, lacks. It is pleasant to see that, after numberless taunts in his preceding volume and in this, Mr. Seilhamer at last (on p. 277) is moved to bless where before he had banned, and to declare some of Dunlap's merits, and to call him "a very interesting figure of a time when aspiration was, as yet, unable to realize her ambitious aims."

In considering a catchpenny piece of mere bookmaking like Mr. Alan Dale's 'Familiar Chats with the Queens of the Stage,' the difficulty of the critic is not to form an opinion, but to formulate it in words with due regard for decorum. The book is unspeakable trash. It is thoroughly vulgar in tone; and quite as offensive as its vulgarity is the self-satisfied conceit which is obtruded on almost every page. Caddish is the only vocable which describes this book fairly.

Letters from Rome on the Occasion of the Ecumenical Council, 1869–70 By the Rev. Thomas Mozley, M.A., formerly Fellow of Oriel, author of 'Reminiscences of Oriel,' and special correspondent of the *Times*. Two volumes. Longmans, Green & Co. 1891.

Thomas Mozley, the writer of these letters, is now eighty-five years old. With his two brothers, James and John—there were three others—he was deeply involved in the Oxford movement. Newman became his tutor at Oriel in 1826, and he and his brother John married Newman's sisters Harriett and Jemima in 1836. When he became a Fellow of Oriel in 1829, Newman had great hopes of him, but they were hardly justified by the event. His younger brother, James B., was a man of much more solid character and mind. He, with the late Dean of St. Paul's, would seem to have remained in the English Church from clear conviction when Newman went over, while Thomas Mozley seems to have kept himself there by mere force of will. In his 'Reminiscences of Oriel' his account of his beliefs and motives gives the same impression of sensational unreality that we get from Hurrell Froude, William George Ward, and many others of their school. But the 'Reminiscences,' published in 1882, was certainly the most entertaining of the many books which have been written concerning the Oxford movement. As to its accuracy and fairness, that is another matter. When he sent Newman the MS. of the first ninety-nine chapters, the Cardinal warned him that some of the many he abused were living still, and that the dead had living friends. But apparently none of these things moved him, for it does not seem possible that any abusive, spiteful, or malicious matter was left out.

The temper of these letters is much the same as that of the 'Reminiscences'; perhaps a little less malicious because dealing less with personal acquaintances and friends. They are the letters of a man who has no illusions, but who has given up so many that he is hard and cynical. They were written for the London *Times*, and if Newman read them as they came out, it must have been with mingled sympathy and indignation. He had himself no hankering for the Pope's infallibility, and had called the English Catholics pushing for it "an aggressive and insolent faction," and hence had some sympathy with Mozley's satisfaction in the opposition to it in the Council and the misfortunes of its abettors. But ineffable must have been his scorn of Mozley's levity in dealing with the whole business. In his introduction Mozley says: "Over all the matters handled I now think with more gravity." He could hardly think of them with less. It takes a man who has been almost converted to another creed

and has somehow saved himself to show it up with all its imperfections on its head. Though he still spells his personal pronouns for the Virgin with capital letters and accounts himself an Anglo-Catholic, no rationalist pure and simple could have brought to the treatment of the Council a less sympathetic mind. Even his fellow-Churchmen must have sometimes winced at his mixing up of things sacred and profane, as where he says the English Church —outside the walls of Rome in 1869—was over an inn, "and the only relics were those of the last meal."

It is a serious limitation that the letters break off in April, when the writer was driven away from Rome by threatening fever, so that only about half the period of the Council has a record here. On July 19 he turns up again in Rome, and writes a letter describing the proclamation of infallibility the day before. Before he left, there was a letter every day, even when there were recesses of the Council. The letters written on these off days are some of the most interesting in the book. They furnish a memoir that will be very serviceable to the future historian when he would describe Rome as it was in the last days of the Pope's temporal power. The divinely governed city seems to have been the worst governed upon earth. The subject of its "solid stench" is one of which the writer does not tire; he is really eloquent when he comes to this. It is very little that he has to communicate about the doings of the Council, and there is no pretence of knowledge. He protests that he can find out next to nothing, and even when he has a bit of news, he warns his readers that he may have to take it back in his next letter; and he does have to do so almost every time. If the statements contradicted and the contradictions were omitted, the amount of matter would be reduced one-half. But the letters are no less interesting on this account. Anything in the nature of a pageant is admirably described. Every amusing aspect of the situation is economized for all its worth. Mozley is very confident at first that there will be no decree of infallibility, but his confidence gradually oozes away. It is interesting to know that on the final vote, when from 130 to 140 were absent or abstained from voting, and there were 533 *Placets*, one of the two *Non-Placets* was by the Bishop of Petricula, which, being interpreted, is the Bishop of Little Rock, Arkansas. Good Anglo-Catholics are bound to be strong anti-Protestants, but no Protestant could stand more doughtily for the right of private judgment than does Mr. Mozley in these letters. Here he sometimes forgets himself into real earnestness. This is, perhaps, because he is even more Englishman than Churchman, and at bottom it was probably this lack of perfect balance in his character that kept him from going over to Rome.

The editing of the book is very strange. Nothing is said in advance of certain chapters explanatory and reminiscential that will be introduced, so that now and then, when we think we are reading an immediate impression, we find that we are reading recollections dimmed by the lapse of twenty years and more. At the end of some chapters there are queer little collections of telegrams, whether the author's own or another's we are not informed. He is irked at times by the omniscience of *Quirinus* as compared with his own nescience; but though *Quirinus* had either more friends at court than Mr. Mozley or a more penetrating sagacity—perhaps both—it may be doubted whether his letters will serve the future historian half as well as these, in which the proportion of fact to "wild surmise" is as Falstaff's bread to his sack, but which are always bright, amusing, witty, and give us all the social atmosphere and setting of the great event. Occasionally Mr. Mozley wrote and forwarded an editorial for the *Times*, and some of his editorials are given. Their difference from his epistolary style is creditable to his facility. He simulates the thunder of the regular *Times* leading article very well indeed.

The Advancement of Science: Occasional Essays and Addresses. By E. Ray Lankester. Macmillan & Co. 1890. 8vo, pp. 387.

Prof. Lankester is one of the best known of England's living zoölogists. His published investigations place him in the front rank, and, whether technical or popular, even though the opinions expressed may not meet with general approval, they are always worthy of careful attention. The rapidity of its recent progress has staled many things pertaining to biology that but yesterday were new. Much of the matter in this book, all of it less than twenty years old, already belongs to the past, yet, because of its connection with present research, it retains a great deal of its interest. "Degeneration" is made the title of the first essay; the sub-title, "A Chapter on Darwinism," might well have been applied to the greater portion of the volume, since its most prominent feature is laudation of Darwin. While this will insure a favorable reception from persons of like belief, it rouses the impression in others that by thus praising his master the disciple is patting himself on the head. Partisan bias, from which the author is seldom free, is the most serious defect in the work. It is prominently seen in the chapter on "The History and Scope of Zoölogy," from the ninth edition of the 'Encyclopædia Britannica,' to which it gives an appearance such as might be expected in a history of religious belief written by the most zealous follower of a particular prophet.

The chapters on "Parthenogenesis" and "A Theory of Heredity" are followed by a note in which the author says: "In both of these articles the reader will find evidence of a belief on my part in 'the transmission by heredity of acquired characters.' This belief is one which I now think is not justifiable." His present belief holds natural selection to be the one supreme factor. Nevertheless, in one place he mentions "a set of forces such as we sum up under the head 'natural selection,'" and, in another, remarks upon the forces, dealt with as laws by physicists and chemists, by which the biologist seeks to explain the process of the automatic evolution of the forms of life. As regards these forces and their action he is at one with Spencerian evolutionists generally, and is not necessarily at odds with present-day Lamarckians. But the variations resultant from such processes are not fortuitous, and from continuity of action they are cumulative and of necessity transmissible. Consequently, he at once changes front in his practice, and, like other Darwinians, treats selection as the bundling up of results, proving and supporting his positions by theory, while demanding that opponents shall use only actual experiment. The difference between his belief and that of the majority of zoölogists, including all those of prominence in America, amounts to about this: he makes selection to be the great cause; they accept it as a passive aggregation of the effects of many causes, rather than an active factor, and they might have to broaden his definition of science, "a knowledge of causes," to give his theory scientific standing.

"A Theory of Heredity" is a review of Haeckel's theory, showing it to be but a slightly different phase of Herbert Spencer's. The author attempts to reinstate the discarded theory of pangenesis, of Darwin, by attaching it to the Spencerian, without manifestly improving the latter. Near the beginning of the book great stress is laid on the importance of hypothesis or theory; the effect of this is weakened by later statements of the experimental processes in chemistry and physics, as in the work of Pasteur and in that of Siebold, until we are quite prepared for the quotation, from the latter, of Aristotle's saying: "More belief must be given to observation than to theory, and this last is only worthy of belief when leading to the same result as experience."

The short essay on "Examinations" is written by one who formulates from much experience and study what should be helpful to a multitude of educators. "Biology and the State" and "Pasteur and Hydrophobia" are eloquent pleas for State aid to scientific research. One of "The Scientific Results of the Fisheries Exhibition, London, 1883," is seen in the Plymouth Laboratory, the benefits of which are confined neither to the present time nor to the British Islands, and in the establishment of which the author acted a most prominent part.

From the discussion of "Centenarianism" we gather that Europeans are longer-lived than other men, and that Englishmen live longer than other Europeans. The statistics make the expectation of life at sixty, in England, to be about eighteen years for steady and sober field laborers, confirmed drunkards having only half as much; about sixteen years and a half for the females of the aristocracy, and fourteen and a half for the males; about twelve and a half for clerks, and eleven and three-quarters for miners; while sovereigns of all countries at sixty have an expectation of less than eleven years. "Distinguished men live a shorter time than less distinguished, on account of their harder work; married live longer than unmarried persons, on account, perhaps, of the measured tranquillity of connubial life; women longer than men, because they lead an easier life; and the clergy longer than other professional men, for the same reason."

"Men can diminish the mortality of populations by attention to simple laws of health, and, by increasing the average longevity, give that increased happiness and prosperity which security of life and health brings. It is in sanitary action that the *elixir vitæ* has been discovered in these days, which, though it perhaps has not as yet increased the roll of centenarians, has no limit to its operations, until the time shall have come when man will no longer, as Buffon said, 'die of disappointment,' but 'attain everywhere a hundred years.'"

The Intercourse between the United States and Japan. By Inazo Nitobe. Baltimore The Johns Hopkins Press.

This is a monograph of nearly two hundred pages written chiefly in Philadelphia, as the author informs us in his preface, under the hospitable roof of a Friend. The other friend to whom the author is indebted for valuable emendations and in the reading of proof-sheets, Miss Mary P. Elkinton, is now the wife of the author. Mr. Nitobe, having become a Christian in Japan, and in Philadelphia embraced that form of it professed by the followers of Penn, writes English with a fluency, accuracy, and coloring not often met with in

the writings of Japanese who use a foreign language. He has the living spirit as well as the good form. Born in a southwestern province, and educated in Yezo, the extreme north, and well versed in scientific studies, he knows well both nature and man in his own country. Receiving degrees at Johns Hopkins University and at Halle, Germany, and the author of a work in German which has also met with deserved translation into French, his style bears the watermarks of the man of thorough culture. He has entered into the world of western ideas, as well as mastered its classified knowledge. Scholarly by discipline, even to easy use of his own native literature, eager in the pursuit of facts which illustrate his thesis, not only in Japan and the United States, but also in England, Holland, and Germany, he has produced a monograph of singular interest. This is published as extra volume eight in the eighth series of the Johns Hopkins University series.

It was about 1840 that the painted vessels of the western peoples began to be so numerously seen off the coasts of Japan as to make the "Song of the Black Ship" at once popular and prophetic. This prophetic ballad, done into English, serves as introduction. A spirited chapter treats of foreign intercourse before Perry, in which it is clearly shown how inclusive as well as exclusive was the policy of the Japanese rulers of the seventeenth century, who sought to insulate the "divine country" from the shock of change. After reviewing the relations of Korea, China, Spain, Portugal, England, Holland, Russia, France, and the episode of Christianity, the author treats of "the dawn of Western knowledge in Japan." This first light came by contact with the Hollanders at Nagasaki, and was generated by the study of the Dutch language. The first martyrs, Takano and Watanabé, after being ferreted out by the sleuth-hounds of the Yedo Government, committed hara-kiri to save their wives and children from disgrace. Others, like Sakuma, followed, however, and, in addition, the hundreds of native physicians, who improved their knowledge by Dutch books, were as little spots of light all over the empire. Very few indeed of the recent or present Japanese leaders in politics, science, religion, or education, but trace their enlightenment to Dutch culture. The list of martyrs for the sake of truth is still far from complete, though in the recently published biographical dictionaries of Tokio, one may recover many names. One of these, an artist who in 1840 was compelled by the Yedo authorities to disembowel himself for introducing foreign ideas in his painting, has recently been posthumously honored by an exhibition of his works.

Chapter ii. surveys the American contacts with Japan, showing how the whale was the pilot. Perry's predecessors are named and described, and the causes, detail, and success of the Perry expedition set forth, the contemporaneous Japanese political side being also exposed. The author's comments are here original and forcible, but to Townsend Harris, the true founder of Western diplomacy with Japan, he awards the higher meed of praise. He asserts, quoting from Katsu Awa, the interesting fact, which close students of Japan in the last years of feudalism have long suspected, that, "even if left to itself, the Shogunate would without external cause have perished, within ten years, of bankruptcy."

Most interesting, to the general reader, is the chapter on Americans and American influences in Japan. Here the author compares and freely criticises our diplomatists, teachers, missionaries, authors; and racily comments, in the most refreshingly honest way, about them. All those accustomed to look at the facts in Japan through their own selected and favorite chromatic lenses, will either greatly enjoy or be specially irritated when looking with the author's. Very suggestive is the section on the "Dark Side of Foreign Influences."

Chapter v. treats of the Japanese in America, from Sam Patch, the waif, to the Imperial Embassy. The influx of students is noted, and judicious comments made on their mental aptitudes, morals, and religion. The section on "Romance" shows how largely cultivated Japanese have been able to win ladies of culture and character in Europe and America to share their lot with Japanese husbands, and to brave the terrors of the unknown female world in the land where polygamy still lingers. Female students, Japanese in California, exhibitions, and mercantile houses, are agreeably treated with much interesting information, and then a characteristic farewell concludes this unique work. It is certainly the best treatise on its special theme, and, besides being a charming piece of literary art, conveys a large amount of information and critical judgment from the Japanese side, for which Americans may be grateful. The statements are in general thoroughly accurate, and the temper is that of a judge. There are, however, one or two passages of a critical nature, tinctured with the author's peculiar views, as, for example, the stricture upon the missionary's administration to his converts of the rite of water-baptism, which are out of place, and, in so far, vitiate the general excellence of taste and catholicity of spirit which make the chief charm and value of the book. There is a good index, and the volume ably fills a notable part of the story which, when completed, will be one of the most fascinating in all history.

Modern Customs and Ancient Laws of Russia. By Maxime Kovalevsky. London: David Nutt.

THE general character of Mr. Kovalevsky's very interesting volume, which is a summary of a course of lectures delivered before the Taylorian Institution in Oxford, may be gathered from the titles of the chapters: The Matrimonial Customs and Usages of the Russian People; The State of the Modern Russian Family; The Past and Present of the Russian Village Community; The Russian Folkmotes; Old Russian Parliaments; The Origin, Growth, and Abolition of Personal Servitude. One important conclusion arrived at, after a survey of the ancient Slavic customs of marriage, and comparison of them with survivals of similar customs in other countries, is, "that the comparative immorality of the Russian peasants has no other cause than the survival amongst them of numerous vestiges of the early forms of marriage." He adduces facts to show that the prevailing opinion of the Russian peasant has been and is that marriage is nothing more than a civil contract, entered into in the presence of the community, as a sign of its recognition and sanction. Another point is, that the present indissolubility of the marriage tie, now legal, has not always been recognized by the common law of Russia. Up to the middle of the last century, the Russian clergy often dissolved the marriage bond for simple incompatibility of temper, while the Cossacks of the Don practised divorce by announcement before the popular assembly no longer ago than the end of the eighteenth century.

Mr. Kovalevsky demonstrates the influence for good which the ancient communistic system of the house community has had upon the peasant character, although he shows that the effects of this system on the country, as a whole, are not altogether to be commended. The village communal system, which is the modern form of these mediæval house communities, is pronounced by the author to be a compound of small advantages and great disadvantages; the advantages being moral and the disadvantages economic in character. This is the impartial view of one who holds with neither of the parties which are seeking to draw conclusions profitable to their own theories from this state of things—the Socialists and the Slavophils. He predicts that the village community will soon disappear over the greater part of Russia, as it has already disappeared in the countries of Europe.

Our author answers the question as to whether the autocratic form of government is a truly national institution, in the way familiar to students of Russian history, supporting his view with an unusually wide range of authorities, both from Russian and from other Slavic sources. He follows the career of the State Council, and the rise, course, and decline of the States-General, in a way which renders perfectly comprehensible his opinion upon the rule naturally evolved by the Russians, and sets forth the fact that these States-General have never been abolished by law, and that no legal act lies in the way of a new convocation of the representatives of the Empire. In their right of choosing the Tzars, they had the advantage over both the English Parliament and the French States-General, the latter of which they resembled in this particular, that they had no power of initiating reforms, but were confined to presenting petitions and complaints. The Russian States-General fell under Peter the Great. Their intellectual qualifications were too small, their prejudices too great, to permit of their aiding him in his projects of reform; and autocratic rule was in the ascendant all over Europe. The proposition, made in the reign of Alexander I., to introduce into the Council of State representatives from the different Estates of the Empire, and the decree signed by the late Alexander II., on the day of his assassination, complete the record of this Council, whose national character must be admitted, after the clear and forcible presentment of the case by the author, who is an ex-Professor of Jurisprudence in the University of Moscow.

If one chapter more than another can be designated as especially interesting, it is the last, which sets forth the gradual growth of serfdom, and the analogy of its rise with that of the system of farming on half-profits, which has prevailed and still prevails in several European countries. The manner in which serfdom was gradually, and inevitably, as it seems, established; the attempts to abolish it early in the present century; its final abolition in the last reign, are all explained in a brief but satisfactory manner, which will meet the wants of those readers who have not the time to seek the separate bits of information on these subjects which are scattered through history.

Church and State.—The Fruits of Culture. By Count Leo Tolstoi. Boston: Benjamin R. Tucker. 1891.

THERE is very little that is new, either in form or in ideas, in Count Tolstoi's 'Church and State.' It contains, in addition to the brief article which gives the volume its title, four other dissertations, called Money, Man and

Woman, The Mother, and A Second Supplement to the Kreutzer Sonata. The third and fourth of these are taken directly, the first and second practically, from volumes already published ('What to Do' and 'My Religion'). The fifth merely repeats what the author has said in the 'Kreutzer Sonata,' and the only interesting point about it is its juxtaposition with the two harangues which precede—and contradict—it. As persons of average intelligence have probably long ago made all necessary comments upon the inconsistency therein displayed, the only inducement to purchase this fresh repetition of what is already far more worn than even the proverbial "twice-told tale," is done away with.

In 'The Fruits of Culture' we can, at least, take observations upon the famous Russian writer from a fresh point of view. We gave a detailed account of the plot of this comedy nearly a year ago. At present it will only be necessary to consider it from a literary standpoint and as a translation. Of the latter, it may be said at once that it is awkward, inaccurate, and made from the German, not from the Russian direct. While the author has, undoubtedly, shown a strong dramatic instinct in his treatment of various situations in his novels, this attempt in the line of distinct dramatic writing cannot be pronounced great, either in matter or arrangement. For those who are intimately acquainted with the conditions of Russian life, and with the peasants, the work is clever. But what little of this the uninitiated layman might have hoped to gather is utterly obscured by the inadequate rendering into English, which transforms a *valet* into a "chamberlain" (and, incidentally, a gentleman), and otherwise upsets that meaning which would not be remarkably clear to foreigners under the best of circumstances.

The Rise of Christendom. By Edwin Johnson, M.A. London: Kegan Paul, Trench, Trübner & Co. 1890. 8vo, pp. xvi., 499.

Our century has witnessed some strange transformations of old history, but they all sink into insignificance in comparison with the reconstruction proposed by Mr. Johnson. His thesis is simple and clear: Christianity, he holds, arose about six hundred years ago, an invention of the cloisters of St. Basil and St. Benedict. In the time of the great revenge of the West on the East, the period of the Crusades, European envy of the Jews led certain corporations to concoct a religion which should be superior to the Israelitish. The Jews themselves, however, had borrowed their religion from the Arabians; it is to Islam that we owe Judaism and Christianity; it fashioned the figures of Adam, Moses, David, and the rest. The Koran grew up in the East; out of it the Rabbis of Spain and Italy composed the Old Testament; and the non-Semitic religious societies of Europe thence produced not only the New Testament, but also a long line of historical and dogmatic works, the object of which was to prove that the Christian Church was coeval with the Roman Empire. In a word, Mr. Johnson maintains that the whole mass of Christian literature which claims to be anterior to the thirteenth century is a forgery. His proof rests on the statement that the genuine literature and inscriptions of the early centuries know nothing of Christian ideas.

It is difficult to see why our author should stop at Islam in his critical reconstruction. He might make a fair argument to show that Islam itself arose on Persian soil and was borrowed from Persian sources, that the Persians in their turn were the pupils of India, that Hindu thought came from China, and so on *ad infinitum*. It is a melancholy spectacle, this expenditure of learning on a scientific monstrosity—the more that Mr. Johnson is profoundly in earnest with his theme, and looks on its establishment as very important for the progress of civilizat on.

The Nation.

NEW YORK, THURSDAY, MARCH 19, 1891.

The Week.

LORD SALISBURY'S last despatch in answer to Mr. Blaine on the Bering Sea matter ought to close the controversy. It is a model of cogency, conciseness, and coolness, and might be profitably studied by Mr. Blaine as a rhetorical model, even if its argumentation were less formidable. Lord Salisbury disdains, apparently, to notice the famous St. Helena precedent, but he agrees to submit to arbitration every essential point in dispute; and the neat way in which he extracts these points from Mr. Blaine's confused pleading must delight connoisseurs.

A conspiracy like the New Orleans Mafia is usually, in other countries, put down by some sort of martial law. This is the way the Thugs were got rid of in India, the Moonlighters in Ireland, and the Mafia in Sicily. Martial law, and the quick action of military justice, seem, in fact, the only efficient remedy when the local population is so cowed that it cannot be depended on for jury duty or for testimony as witnesses. The Molly Maguires were, it is true, put down in Pennsylvania by the ordinary action of the criminal courts. But there the surrounding population was not cowed. The Molly Maguires were surrounded by a great American community which was not afraid, and which was determined to get rid of hired assassins. What the New Orleans people could have done by special legislation to get rid of the Italian nuisance by legal means, we do not pretend to know. But, assuredly, all legal resources should have been exhausted before breaking jails open and slaughtering prisoners through the instrumentality of a promiscuous crowd collected in the streets. We have received letters commending the action of the mob, and contrasting the vigor and courage of the prominent citizens who led it and in part composed it, with the indifference, supineness, and cowardice touching municipal government of the corresponding class in this city. We do not print them because we can conceive of no good that can come, in the existing condition of American society, of defending or excusing lawlessness or violence, under any provocation whatever. It is not everywhere, as in New Orleans, that the best citizens have physical force on their side. But we will say that were the courage and fiery indignation of the New Orleans lawyers, merchants, and brokers put behind the law in this city for its assertion and vindication, we should be far better off than we are. Our corresponding class is apt to sneak away and become apologetic, or say, "Well, now," when challenged by the dangerous classes even to a legal and peaceable trial of strength.

For the second time in our history, one of the older States is to elect, at one session of the Legislature, two Senators for full terms of six years each. The first case occurred in Louisiana during 1888, when, under the system of choosing members of the Legislature for four years, the law-makers were called upon to elect not only the successor of Mr. Gibson, whose term was to end in 1889, but of Mr. Eustis, whose time did not run out until March 4, 1891. Mississippi will elect her first Legislature under the new Constitution in November next, and its members will serve until after the election of November, 1895. The term of Senator George will expire in March, 1893, while that of Senator Walthall runs on until March, 1895; but no other Legislature will be chosen until after the latter date, so that the Legislature elected next fall will have to fill both seats. This state of things will recur every twelve years, and it is certainly an anomaly in our system. It is, of course, desirable to have the Senate removed as far as possible from the influence of sudden waves of popular feeling, but the Louisiana and Mississippi plan does not help to secure this result. On the contrary, it might happen that a temporary craze, like that which swept over Kansas last November, would sweep into the Mississippi Capitol next November a Legislature which would give not only the seat that falls vacant in March, 1893, but also the one which is already filled until 1895, to representatives of wild doctrines which the people would repudiate long before 1895.

The Farmers' Alliance has set out to capture both these Mississippi Senatorships for men who will pledge themselves to support the absurd sub-treasury project. But both Mr. George, who will stand for reëlection, and Mr. Walthall, who announces that he will not be a candidate, have come out with letters against this crazy scheme so cogent and convincing that it seems already clear that they will carry the people with them. Mr. George shows the unconstitutionality of the project, and declares his belief that practically the scheme would not prove a benefit to the farmers, but rather a curse, since "it would be very costly, necessitating the employment of many thousands of new officials, and this cost would in the main be paid, as taxes are now paid, by the farmers and laborers of the country." Mr. Lamar's experience showed that the public man in Mississippi who stands by his convictions will find the people standing by him. He refused to obey the instructions of the Legislature to vote for free silver coinage a dozen years ago, went before his constituents for vindication, and was unanimously reëlected. Mr. George promises to reap a similar reward for his courage.

The Republicans of Illinois have covered themselves with something different from glory by abandoning their honored and honorable candidate for Senator, Richard J. Oglesby, and running after a will-o'-the-wisp, or several such, in the persons of Streeter, Moore, Lindley, and what not who inscribe on their banners the initials F. M. B. A. Oglesby was the Republican caucus nominee, and was entitled under party rules and usage to the stanch and united support of the Republican members of the Legislature. But, after voting for him a while, a coterie of "smart fellows" conceived the idea that they might beat Palmer by abandoning their own nominee and voting for one Streeter, a Greenback-Labor agitator of the olden time. This was "changing front in the face of the enemy," and doing so under peculiarly hazardous circumstances, since, in order to elect Streeter, it was necessary to transfer to him every one of their votes. They had 100 in all, and the F. M. B. A. people had 3. It required 103 to elect. Therefore, if there should be one obstinate member, one who believed in sticking to his own text and his own candidate, the manœuvre of changing front in the face of the enemy would fail and most likely bring disaster. It turned out that there were a dozen who could not be driven out of their own camp.

The election of Gen. Palmer determines the political division of the Senate in the Fifty-second Congress. The Legislatures in Florida and California have still to elect, but there is no doubt as to the result in each case—a Democrat in Florida and a Republican in California. This will give the Republicans 47 members and the Opposition 41, the latter including the two Alliance men from Kansas and South Dakota. This would be a Republican majority of six if all of the 47 could be depended upon. But they cannot. Three of them—namely, Paddock of Nebraska, Pettigrew of South Dakota, and Plumb of Kansas—voted against the McKinley Bill last October, and Hansbrough, the new Senator from North Dakota, is committed against all high-tariff measures. It is therefore obvious that the Senate no longer contains a high-tariff majority, and there is every reason to suppose that it may pass bills reducing the tariff on particular articles if the House sends over such measures. Despite the admission of half-a-dozen new States, "the sure Republican majority in the Senate for ten years" which was counted upon only a year ago, has already vanished.

We have had lately, in the form of interviews, the opinions of Senator Peffer and Congressman Simpson of Kansas on the subject of finance. Both these gentlemen are representatives of the Farmers' Alliance, and both have betrayed a fondness for Government paper money rather than for silver. And now comes Congressman Davis of the same State and the same Alliance. His interview on money and finance is published in the Philadelphia *Press*. "We hold," he

says, "that banks should not be allowed to issue notes. These should be printed and put out by the Government. The tariff should be reduced till there is a deficit in the Treasury, and then greenbacks should be printed and issued to pay all claimants." Being asked whether the notes would be redeemable, he replies: "No; not in metal money. Each bill should bear the legend, say, 'One dollar, receivable for all dues and debts.' This would make it receivable for all taxes and import duties, and legal-tender. This would keep it perpetually at par"—meaning at par with itself, of course. Each note would be worth as much as every other note of the same denomination. This was one of the peculiarities of the French assignats, and of our Continental money, and of the Confederate money. Every dollar was at par with every other dollar, whether of the original issue or of any subsequent issue. The advantages of having a currency always at par are too obvious to require comment.

Congressman Davis has other advanced views on the subject of finance. He would have the Government lend its new legal-tender notes to farmers at 1 per cent. interest. Being asked how the lending should be done, he said:

"This way: Suppose I owe you $5,000 and accumulated interest on my farm. This new law would direct you to add the interest to the principal and go to the Treasurer of my county and file the mortgage and an abstract of the property and get *a check on the nearest bank* for the entire debt. That would satisfy you. Then the County Treasurer makes a draft on the United States Treasurer for the money, and gets it—in crisp, new bills. That satisfies him. The United States Treasurer accepts the mortgage on the farm (providing it is worth the amount of the mortgage) and sends word to me when the 1 per cent. interest is due. Is not that simple? It is the first news I have had of the transfer of the debt. That ought to suit everybody."

A check on the nearest bank! Good gracious, are we to have banks still? What do we want banks for after the Government has taken in hand the whole business of making and lending money? And what is the use of the mortgage, anyway? Mr. Davis hints that the United States Treasurer is only to pay out his crisp, new bills if the farm is worth the amount of the mortgage. Worth the amount in what? Not in metal money, but in the bills themselves, which are always to be at par with each other. The bills, too, would be at par with the mortgage, the mortgage at par with the bills. Why not make the mortgage legal-tender, and done with it? That would save time and dispense with the services of the bank, and everybody would be as well satisfied as with the other plan, if not better.

The Republicans in the Maine Legislature have defeated the proposed Australian Ballot Law, on the avowed ground that the reform was favored by the Democrats, and that the adoption of a system which allows men to vote their convictions would endanger Republican control of the State. Boutelle of the Bangor *Whig*, who has led the fight against the secret ballot, has based his opposition openly and emphatically on these two grounds: (1) That the Democrats favored the reform, and therefore the Republicans should go against it; (2) that the Democrats favored the reform because they thought a secret ballot would help their party and hurt the Republicans, and that they were entirely right in thinking so. "Let the Republicans Stand Firm," was Boutelle's last appeal in the *Whig* to the Republicans in the Legislature before the vote was taken in the House at Augusta last week, and his position that the proposed reform was a "dangerous scheme" for Republicans to permit was endorsed by the party. More than two-thirds of the Republican members voted against the bill, defeating it by a vote of 74 to 71.

The bill pending at Albany to tax all inheritances over $5,000 has been made the subject of loud objurgation and protest, as though it were *prima facie* an act of spoliation. We are accustomed to consider the estate of every deceased person as the rightful property of his next of kin, and hence to conclude that the State has no more right to help itself to a portion of the property than to seize arbitrarily the earnings of a living person. But the fact historically is that it is the State, and only the State, that enables surviving relatives, even children, to enjoy the possessions of the deceased. Without the State, *i. e.*, organized society, all property is the prey of the strongest, and most especially any property whose owner no longer has need of it. It is the State that enables the owner to make disposition of it after his death. The question whether the State should take some portion of it for its own uses is one of detail, and not of abstract principle. Most civilized communities recognize the fact that the death of the father or mother leaves the family in a worse position than it was before, since it is deprived of the earnings and care that it formerly received, and hence that the estate, so far as concerns the direct heirs, should not be the subject of a special tax. Most communities, New York among the number, consider the property of decedents passing by will or inheritance not in the direct line as property subject to a special tax. The tendency and drift of enlightened opinion at the present day is towards the special taxation of large inheritances both in the direct and the indirect line. Of course, such taxation may be perverted and made an instrument of gross injustice, but it is not to be classed as spoliation *per se*.

Census Office bulletins furnish the number of white and colored pupils respectively enrolled during the census year in the public, private, and parochial schools of five of the Southern States, viz., Maryland, Virginia, North Carolina, South Carolina, and Louisiana. The total population by races has been announced for all these States except South Carolina. The following table shows the number of white and of colored pupils enrolled in each of the States mentioned except South Carolina, the total white and colored population, and the percentage of the total population of each race which the school enrolment constitutes:

States.	Population.		School enrolment.	
	White.	Colored.	White.	Colored.
Maryland...	824,149	218,004	167,338	37,009
Virginia....	1,014,680	640,857	233,444	123,661
N. Carolina.	1,049,191	567,170	232,427	120,405
Louisiana ..	554,712	562,893	94,417	55,058

States.	Percentage of school enrolment to total population.	
	White.	Colored.
Maryland	20.31	16.98
Virginia	23.01	19.30
North Carolina	22.15	21.23
Louisiana	17.01	9.78

As was to be expected, a larger percentage of the white than of the negro population is at school in each of these States. In North Carolina the difference between the percentages of the two races at school is apparently but trifling, and it is not very great in either Maryland or Virginia. It must be borne in mind, however, that because of its heavy birth and death-rates it is probable that a larger proportion of the negro than of the white population is within the school age, and that consequently these differences against the blacks are larger than they seem to be. But, after all proper allowance is made on the score just mentioned, the comparison for the States of Maryland, Virginia, and North Carolina is eminently satisfactory. Not so much can be said for Louisiana, in which State proportionately but little more than half as many negroes as white children are at school. While these figures show that there is still much to be accomplished in Louisiana, the fact that the public-school enrolment of the State has in the last ten years increased 53.52 per cent., as against an increase of population of but 19.01 per cent., shows that great progress is being made in the right direction.

Two letters in the *Tradesman*, one from Youngstown and the other from Cleveland, Ohio, give particulars of the shut-down of iron furnaces in the Mahoning and Shenango Valleys, caused by the competition of Southern iron. Of a total of fifteen stacks in the Mahoning Valley only three are now active. The restriction of the output amounts to 5,000 tons of pig-iron per day. The number of workmen idle is estimated at 2,000, which is much smaller than might be supposed, considering the great curtailment of production. The shipment of Lake Superior ore is already cut down one-third, and a further reduction is expected. Vessel freights must necessarily be reduced. The causes of this serious revolution in the iron trade are stated by Mr. Runyan, of the firm of Runyan, Stubbs & Mack of Cleveland, thus:

"They [the South] have their ore, coke, and limestone right at their doors, which is an ideal condition. Their investment in these lands, owing to the primary cheapness, is not great, labor is cheap, and, greatest of all, the furnaces in the South are greatly favored by the railroads. On the other hand, take the Mahoning Valley furnaces. The ore must be dug out of the very bowels of the earth, brought up to the surface, and loaded on cars. It is hauled to the lakes and dumped in vessels, transported several hundred miles, then shovelled out of the vessels on to docks, and from the docks to the cars, and carried another hundred miles or more to the furnaces."

This is no new tale. On the contrary, it has been reported a hundred times since the close of the war, but it was not believed until the iron actually came. How to meet this competition, which no McKinley Bill can shut out, is a serious problem. The writer says that in order to compete with the Southern product, the Ohio furnaces must be able to sell mill iron at Cleveland for $12 per ton. The price of Scotch pig at Glasgow at last accounts was $11.18 per ton, and of Middlesbrough pig in the Cleveland district about $10. It would seem, therefore, that a duty of $6.72 per ton was not of much use except to deprive the New England manufacturers of the cheapest raw material within their reach. In all the discussions of the Southern iron question, we have nowhere met the suggestion that, when the Southerners have crushed out Northern competition, they will put up their prices and extort any sums they please from consumers. Only foreigners do that.

The money-seeking manifesto from Parnell will, we trust, meet with the response it deserves from such of the American-Irish as have any money to spare for Irish needs. To subscribe for the maintenance of Parnell's agitation now would justify the most violent charges ever brought against their intelligence. There is no view of Parnell's position which now warrants his remaining in the field. No matter how unjustly he may have been treated, either by Gladstone or by his own Irish colleagues, his one duty to Ireland is to get out of sight. The fact that he has been ill-used does not authorize him to go on wrecking the home-rule movement. Every attack he makes on the other Home-Rulers helps to disgust the civilized world with the Irish cause, and satisfy foreign observers of its hopelessness. According to his own account, the only honest and sensible men connected with the cause are himself and a few personal followers of the kind he has sent here to raise money. But if this were true, what rational man would care to see Ireland a self-governing country? If this be not true, what a spectacle of effrontery he presents. All money given to him will be used as directly to discredit home rule as if it were given to the Tory electioneering fund, and far more efficiently. In fact, there is abundant reason for believing that Parnell is now getting all the help from the Ministry he can get privately and indirectly.

The People's Palace in East London has entered upon a new phase of its existence, which is likely to be its last, unless radical measures to mend matters are taken, and that speedily. It has now come to light that the Palace is heavily burdened with debt, and is on the verge of bankruptcy. For the last two years there has been a large deficit when accounts have been balanced. Most of the original endowment was spent in buying land and putting up the present buildings; the grants of the Charity Commissioners and the Drapers' Company have not been sufficient to meet expenses. Perhaps the most disheartening fact of all is that, despite the almost lavish expenditure which now threatens financial ruin as its result, the Palace has failed signally to accomplish the work for which it was originally intended. Its real object, as it was understood in the beginning, was to contribute to the amusement and recreation of the genuine working classes of the East End. Almost three years ago our London correspondent pointed out its tendency to substitute instruction for amusement, and to appeal to an entirely different class of people. And this is exactly what has happened. Even Sir Edmund Hay Currie has just admitted that there is a chance of the Palace being absorbed by the class who are quite able to provide themselves with amusements at their own cost, and that absorption appears to have been already brought about. The fees, Sir Edmund suggests, have something to do with this—a point upon which our correspondent dwelt in his paper on the subject. A fee of admission, to class or show, of even a penny is beyond the means of a man who has to support a family on a pound or thirty shillings a week. But it is in the supremacy given to instruction that the Palace has gone so hopelessly astray. The monkey and dog and poultry and cat shows have been declared responsible for the present financial crisis; but amusements are all too few and far between. "Utility flourishes. Shorthand and bookkeeping thrive," the London critics of the institution are now saying; and something of the present character of the Palace is explained by the fact that, at the much-lauded Sunday concerts, the people have taken to singing hymns. It is boasted as proof of popularity that 3,000,000 attendances have been registered during the first three years of the Palace's existence; but it must be remembered that every one who enters passes through the turnstile—the thousands who go through curiosity as well as members; and hence this is no criterion of the regular attendance. Despite the present financial straits, many new building enterprises are being actively pushed on the Palace grounds.

Unless all signs fail, Brazil is preparing to run the same mad course of speculation and inflation of the currency that played havoc with the Argentine Republic and Uruguay. The issues of paper money go leaping up, month by month, the total outstanding at the end of the last year being stated at $300,000,000 for the national banks and $85,000,000 for the Government. This paper currency is inconvertible, if we may believe the startling assertion of the *Jornal do Commercio*, which says that the Minister of Finance has used the gold reserve to pay off the domestic loan of 1889. Meanwhile, speculation is demanding more and more paper, and is getting about $15,000,000 a month. New corporation and investment companies are springing up like mushrooms. In 1890 over 300 were chartered with a nominal capital of $755,000,000, while in the month of January alone, this year, sixty-three new ones were started with a capital of $310,000,000. The fever that raged in Buenos Ayres and Montevideo until it had nothing left to feed upon, is now at its height in Rio. Vast enterprises are afoot everywhere, their promoters are plunging into the wildest luxury, and everything is rose-colored. No wonder that the clear-eyed *Économiste Français*, which faithfully warned French investors against the Lesseps madness, is telling the owners of the $100,000,000 of French capital in Brazil that their investments are perilous. Luckily, the Government itself does not appear to be so loaded down with debt and obligations as was the Argentine. But it may turn out that Celman's personal corruption is to find its counterpart in the career of President Fonseca; he insisted upon putting through a fat contract for improving the harbor of Torres for the benefit of a personal friend, though it cost him the resignation of a part of his Cabinet. The making public of this fact just at the time that the Rothschilds declined to act longer as Brazil's financial agents in Europe, almost brought on a panic.

Politically, Argentine affairs seem to be coming out of their sad tangle. The drift of things now points to the harmonious choice of Gen. Mitre as President. He has already been nominated for the office by a large and representative convention held at Rosario, and gives promise of conciliating in his person the warring factions left over from the revolution of last summer. It is curious to note how the leaders of that movement make no figure at present. With the powerful *Union Civica* back of them they seem to have become entirely merged in the Mitre party. Gen. Mitre himself is a distinguished personage in modern Argentine history, having won an enviable success in military affairs, and conducted an honorable Administration at the time of his former occupancy of the Presidency, and being besides a man of unusual literary attainments. His absence in France at the time of the political outbreak freed him from the necessity of taking any compromising part in those disturbances, and he is now turned to with relief as a man who can unite the quarrelling politicians in his support. We notice an interview with him in the Madrid *Imparcial*, on his way home, in which he takes his election for granted, and promises a liberal administration.

THE NEW ORLEANS MASSACRE.

THE New Orleans massacre is a horrible illustration of the working of municipal government among us when at its worst. None of our cities is as badly governed as New Orleans is, but there is not one of our larger ones which is not heading in the same direction. It has, more than all the others, been used to violence of all kinds before and since the war. Assassinations and attempts at assassination, street fights, and bloody duels have been constant accompaniments of its politics and of its administration of justice. It has had a local revolution in our own time, in which the State Carpet-bag Government was overthrown, on President Grant's refusing to furnish troops for its protection. Consequently, even the more respectable and sober-minded portion of the community are in a constant state of readiness for remedial violence. When things go very wrong, it is a comparatively easy thing to call an indignation meeting, convert it on the spot into an armed mob, and "execute the people's will" at the muzzle of the pistol and the rifle. Behind such a state of public sentiment the law is always weak, and officials very apt to be corrupt, and ruffians very powerful. The assassination of the Chief of Police last October was undoubtedly the result of the same social conditions which caused the failure of the jury trial and the massacre of the acquitted prisoners in the jail. In such social conditions men's reliance on the law for protection is necessarily small. Somehow or other the known presence of Judge Lynch in a community makes people careless about the character of the judges and juries provided by the Constitution. They are like gluttonous persons who think they have a pill which is a sure cure for indigestion.

The Italian assassins, if there are any left in the city, who murdered or connived at the murder of the Chief of Police, are doubtless terribly awed by what has happened, and so are the jury-fixers and suborners of perjury, and the whole crowd of malefactors, and they will keep out of sight for a year or two. But the seeds of improvement have not been sown. The situation has not been radically or permanently changed for the better, and the prominent citizens who have headed the mob and superintended the shocking scenes in the jail have set an example of lawlessness which has certainly unfitted them for the work of real municipal reform. Yet if any one at this distance could tell a New Orleans reformer how to go to work with advantage, he would have to be wiser than we pretend to be; but it should certainly not be in this way.

For the rest of the country the affair is simple disgrace and embarrassment. Secretary Blaine is now at last placed in a situation in which his capacity in raising a cloud of words will stand him in good stead. Although most of the Italians who have been killed were naturalized citizens of the United States, some were foreigners, and the fact that all are Italians has naturally roused the indignation of the Italian Government and of Italians all over the world. Marquis Rudini will ask for satisfaction of some kind, and under the law of nations is entitled to it, but under our Constitution there is no means of giving it to him. The massacre in New Orleans is an offence against the State law, but the Italian Government has no relations with the State of Louisiana, and, touching crimes against persons or property committed within the State, the Federal Government has no power over the State authorities. In fact, there is an unbroken line of Federal repudiation of responsibility for acts of violence committed against foreigners in the State's jurisdiction, or even for the action of State courts or officials.

In the Macleod case, where a British subject was put on trial in a New York court for murder for acts committed as a soldier in the British service, and of which the British Government assumed the responsibility, Secretary Webster was delivered from a very embarrassing position by the man's acquittal; but Congress promptly passed an act providing for the transfer of all such cases by habeas corpus to the Federal courts. In the case of Baldwin *vs.* Franks, Baldwin was arrested under a United States warrant charging him with conspiring with others "to deprive certain Chinese aliens of the equal protection of the laws and of equal privileges and immunities under the laws"; in other words, to drive them out of the place where they lived and did business. Under section 5519 of the United States Revised Statutes, the court held that although Congress undoubtedly had the power to make this statute cover aliens, it had not done so (Judges Harlan and Field dissenting), and Baldwin was therefore discharged. This is a clear and serious defect in our Federal legislation. As regards the aliens who were killed in New Orleans by the mob, the Federal authorities ought to have the power to prosecute and bring to justice all who participated in the lynching; and until such power is bestowed on them we shall every now and then, when cases of this sort occur, cut a sorry figure before the civilized world. We got off easily touching the Chinese outrages, because the Chinese are patient, barbarous, and far off, and hold life cheap; but the Italians are very different people, and we shall have no small difficulty in meeting the remonstrances which are doubtless now on their way.

THE CENSUS AND THE COLORED POPULATION.

THE Census Office has announced the population by races of the District of Columbia and of each of the old slave States except Mississippi and South Carolina. The following tables show for each census since 1860 the aggregate population by races of the District of Columbia and of the fourteen Southern States, exclusive of the two named, the increase of each race during each decade, and the percentage of that increase:

Date of census.	Population.	
	White.	Colored.
1890	14,495,166	5,504,882
1880	11,707,751	4,844,630
1870	8,793,792	3,678,867
1860	7,452,263	3,365,890

Date of census.	Increase.		Percentage of increase.	
	White.	Colored.	White.	Colored.
1890	2,787,415	660,252	23.81	13.63
1880	2,913,959	1,165,763	33.13	31.69
1870	1,341,529	812,977	18.00	9.30

If the States of Mississippi and South Carolina are included, the negroes, during the decade from 1870 to 1880, increased somewhat more rapidly than the whites in the South as a whole. In particular States their rate of increase was very much greater. In the last ten years these results of the census of 1880 have been frequently cited to prove that certain sections of the South were in process of Africanization. If the census of 1890 can be trusted, the defects of that of 1870, and not the fecundity of the negro race, were the cause of the apparently great increase in that race revealed by the enumeration of 1880. In every Southern State the official figures for which have been given out, the whites have during the last decade made a larger absolute increase, and in every one except Arkansas and West Virginia a larger relative increase, than have the negroes, as the following table will show:

States.	Increase.		Percentage of inc.	
	White.	Colored.	White.	Colored.
Alabama	168,611	81,328	25.46	13.55
Arkansas	224,986	100,561	38.03	47.74
Delaware	19,269	2,580	16.04	9.76
Dist. of Colum.	36,346	16,331	30.80	27.40
Georgia	156,556	138,583	19.16	19.11
Florida	81,856	39,988	57.40	31.56
Kentucky	208,347	1,530	15.13	.56
Louisiana	99,758	79,238	21.93	16.38
Maryland	99,456	7,774	13.72	3.70
Missouri	501,642	8,781	24.80	6.04
N. Carolina	181,949	35,893	20.98	6.76
Texas	543,953	99,453	45.43	25.28
Tennessee	194,140	31,149	17.05	7.73
Virginia	133,822	9,241	15.19	1.46
W. Virginia	136,725	7,622	23.07	29.44
Total	2,787,416	660,252	23.81	13.63

The bringing in of colored laborers to work in the mines and on the railroads of West Virginia explains the relatively considerable negro increase there. The negro population is, however, still numerically an unimportant element in the State.

There has been a large negro immigration to Arkansas from almost all of the more Southern States; but as the colored inhabitants today constitute but little more than one-fourth of its population, and as even during the

last decade the white increase, though relatively less, was absolutely 124,000 more than the negro, there is no probability that the negroes will, in Arkansas, ever outnumber the whites.

In every State, except Georgia, in which the negroes were in 1880 nearly as numerous as the whites, the latter have increased since that year much more rapidly than the former. In Georgia the ratio of growth has been practically the same for the two races; what trifling difference there was, was in favor of the whites. In all of the more northern Southern States, except West Virginia, the ratio of the colored increase has been very small. Indeed, in Kentucky, Virginia, and Maryland the negro population has, practically speaking, remained stationary in point of numbers, while in Delaware, Missouri, North Carolina, and Tennessee the negro increase was less than 10 per cent. It is not impossible that an explanation of this slow growth will be made apparent when the race figures for the old free States are given out. The negro population of California, the only Northern State the race statistics for which are as yet available, nearly doubled during the decade. In Georgia, Alabama, Florida, Louisiana, and Texas, there was a considerable negro increase, but that of the whites was still greater.

As the censuses of 1870 and of 1880 have shown us, it is not altogether safe to rest too securely on the results deduced from a comparison of the figures of two immediately succeeding census enumerations. It may therefore be worth while to compare the statistics of the eleventh with those of the eighth census, the last taken before the old order of things in the South made place for the new. As the following table, which gives for 1860 and for 1890 the number of negroes in every 10,000 of aggregate population in each of the Southern States, except Mississippi and South Carolina, will show, the negro population of the more northern Southern States is proportionately much less numerous than it was thirty years ago, while there has been, except in Texas, very little change in the relative proportions of white and colored inhabitants in the more southern States:

States.	Number of negroes in every 10,000 of total population.	
	1890.	1860.
West Virginia	439	561
Missouri	575	1,003
Kentucky	1,469	2,045
Delaware	1,722	1,927
Maryland	2,091	2,491
Texas	2,204	3,027
Tennessee	2,457	2,550
Arkansas	2,758	2,555
District of Columbia	3,296	1,007
North Carolina	3,505	3,632
Virginia	3,870	4,327
Florida	4,258	4,463
Alabama	4,504	4,540
Georgia	4,701	4,405
Louisiana	5,032	4,949

In Missouri, Kentucky, Maryland, Virginia, and Texas there has been a marked relative negro decrease. A large white immigration to the first and the last-mentioned of these States, and a negro emigration northward from the other three, have been the cause of this great change in the former numerical proportions of the races. In West Virginia, Delaware, Tennessee, North Carolina, Alabama, and Florida the whites have gained since 1860, but not very much. In Louisiana, Arkansas, and Georgia, on the other hand, the negroes have grown somewhat, and in the District of Columbia very much more rapidly than the whites. The great negro increase in the District was, of course, due to the flocking in of negroes during and immediately after the war. During the last decade the white population of the District has grown faster than the black.

In considering the statistics which show the maintenance during the last thirty years of a race equilibrium in the more southern States, it must be borne in mind that the conditions existing in all of these States during a portion, and in some of them during the greater part, of this period were more unfavorable to the increase of the white population than they are likely to be again. If under such circumstances the whites have been able to hold their own, and are now growing more rapidly than the other race, there need, it would seem, be little fear that the Caucasian will ever be relatively less numerous in any considerable portion of the South than he now is.

It is true that if there were no immigration from abroad to swell the numbers of the white race, the negro would probably be able to hold his own. His rate of natural increase is apparently about the same as that of the white man, his greater death-rate being offset by a greater birth-rate. The rate of natural increase for the country as a whole, after deducting the gain by immigration, is 14.40 per cent.; that of the negroes in the States heard from, including California, is 13.72 per cent. This slight difference against the negro will, if it be not materially changed by the statistics of Mississippi and South Carolina, probably be more than offset by the greater number of negroes than whites overlooked by the census enumerators. Whenever, under existing conditions, a Republican Superintendent of the Census uses his patronage wholly or partially for party purposes, the resulting defects in the enumeration will be proportionately more serious in the "black" belts than elsewhere, for in such neighborhoods the Republican workers, from whom the census enumerators will, under such circumstances, be selected, will be of an inferior grade of intelligence to the average petty politicians in other sections. It is possible, but we think not probable, that the census of 1890 may from this cause have failed to include so large a proportion of the negro population as to render doubtful some of the deductions we have drawn from it.

THE WORKING OF THE COPYRIGHT BILL.

THE *Examiner* of this city, the organ of the Baptist denomination, has some observations on the probable working of the Copyright Bill which, coming from a religious journal, deserve some comment. It thinks meanly of the bill, and sneers delicately at those who supported it on grounds of morality, and then remarks:

"It is very evident, nevertheless, that whatever the bill may accomplish, justice to the foreign author is not one of the things. The foreign author is placed by this bill at the absolute mercy of the American publisher. He can only obtain copyright here by accepting whatever terms may be offered. His copyright is valid only if his book is manufactured in this country. No bargaining on his part is, therefore, possible; for if he refuses offered terms, he can get no copyright, and will be in precisely the same case he has been heretofore. American publishers are human, and it is too much to expect of human nature that when the law offers any class of men such an advantage in driving a bargain, the advantage will not be used. With the exception of those few cases in which a great reputation will enable him to make his own terms, the foreign author will be very little benefited by the new privilege formally granted him."

As to this, it is to be observed that the foreign author will be in exactly the same position towards the American publisher as that now occupied by the American author. The American author is now at "the mercy of the American publisher" exactly in the same degree, no more and no less, as the foreign author will be under the new Copyright Bill. Towards the domestic author also American publishers are "human." Towards him also they use all the advantage the law gives them in driving a bargain. The unknown domestic author can only make his copyright of any use to him by accepting whatever terms the American publisher may offer him. The alternative of printing and publishing the book at his own expense is, it is true, open to him, but it will also be open to the unknown foreign author. The distinguished American author has now the benefit of competition between American publishers for the privilege of publishing his book, and a very good benefit it is. The distinguished foreign author will have it also. In fact, the American and English authors will, under the bill, be on exactly the same footing in this market. Their sufferings under the rule of American publishers will be endured in common and their harvests will be reaped in common.

The pecuniary loss which the English author will suffer in being compelled to have his book printed in this country at American rates, will probably be fully met by the use of the plates cast here for the printing of the book in England, because in England the printers enjoy no such protection. The American author who takes out an English copyright will enjoy the same advantage in England. We have freely expressed our opinion of this protective clause in the Act. It is a mean and discreditable provision, but the foreign author will not suffer from it in pocket as much as might appear at first sight.

But the passage in the *Examiner* which most grates on us as coming from a professional moralist is this—for we always like to get

from religious men the benefit of their religion for the affairs of daily life, as we have shown in discussing the Rev. Dr. Funk's case and the Rev. Wanamaker's:

"But to one thing we may as well make up our minds, and that is to pay more for our books. The moralists tell us that we ought to be willing to do this, because now our books will be 'honestly come by.' Honesty had small part in the passage of a bill that will result in a few years in the formation of a powerful monopoly, in utter disregard of the interests of authors on the one hand and of readers on the other. It requires no special wisdom or gift of prophecy to predict this outcome of the Copyright Bill."

Now, is it possible that this means that "the moralists" are wrong in telling the Christians that they ought to be willing to pay more for a book "honestly come by" than for a stolen book? Is it not true that one of the aims and uses of Christianity is to reconcile people to the expensiveness of honesty, and to make repulsive the cheapness and economy of theft? Why should a Christian man be annoyed by having to pay more for a book to the lawful owner of it than he would have to pay to a man who stole it, any more than by having to pay more for trousers to an honest tailor than to a receiver of stolen clothing?

Surely, also, the *Examiner* does not mean to teach our Baptist brethren that an act which puts a stop to one form of thieving is not to be respected unless we are sure that the motives of all its promoters are high and noble. Hardly any act is passed by any Legislature from which some knavish person may not in some way profit, but this is, or ought to be, for religious men, a small matter, provided that in the main the measure works for righteousness. We have before now compared the protection given to American printers in the Copyright Act to a provision requiring foreigners on our soil to wear American clothing in order to entitle them to the protection of the police and access to the courts of justice. But if it had been our practice to plunder all foreigners landing on our shores, no matter what clothing they wore, assuredly it would be the duty of Christian men to hail with delight a statute which admitted foreigners to civil rights on condition of putting on an American suit as soon as they landed, without inquiring too narrowly into the designs of the American clothing-men who got the bill passed. It is, we admit, a national disgrace to attach any condition at all, except honesty and peaceable behavior, to the stranger's and sojourner's enjoyment of the protection of our laws for his person and property; but it is not by any means such a disgrace as allowing bands of wreckers to wait for him at the wharf and rob him the minute he lands of everything salable among his effects. In other words, the Copyright Bill is a great advance towards justice and fair dealing, and the duty of good citizens towards it now is not depreciation of what it is doing, but insistence on what it has left undone.

CONGRESS AND THE PAN-AMERICAN PROJECTS.

At the time when Mr. Blaine was so carefully guarding the delegates to the International Conference from contact with our Congressmen, a Western member remarked that the Secretary was having a very fine time all by himself, but that when he came to ask Congress to carry out his schemes, he would wish he had recalled the existence of American legislators. A review of the fate that has overtaken those schemes in the Fifty-first Congress will show that the Representative from the West was putting it mildly.

First in order and importance among the recommendations of the Pan-American Congress was the treaty of arbitration. This has been put in the very fore-front of the wonderful achievements of Mr. Blaine, and mentioned with almost tearful emotion by himself and others. If the Senate has ratified that treaty, no account of the fact has been given to the world, and it is safe to say that no scruples about the secrecy of the Senate's action would have prevented the Department of State from trumpeting the news abroad if it actually had been ratified. The important thing is, that this failure to ratify really destroys the whole measure, since one of the provisions of the suggested treaty called for an exchange of ratifications on or before May 1, 1891. With no extra session of the Senate in prospect, the entire treaty will lapse, and the prediction of Minister Romero that the United States themselves would never agree to it will be fulfilled. It would be possible, of course, to secure a general agreement to extend the period within which ratification must be effected; but it would be difficult to explain to other nations the strange dilatoriness of the United States in accepting the work of their own Secretary of State. And it is to be remembered, too, that the other members of the Conference have been as backward as our selves. We believe that only Ecuador and Bolivia have given in an unqualified adherence to the treaty. With all the great Powers of the hemisphere declining to touch it so far, this grand invention to establish a universal American alliance of peace is left dangling in absurd helplessness.

Many other recommendations have been similarly ignored by our Congress. The scheme of international and proportional subsidies to steamships does not appear to have been so much as considered. Probably it was not meant for serious consideration, but only as an additional lift to our own subsidy-seeking lines. The proposed simplification of customs regulations has met with no other comment than the ghastly one of the McKinley Administrative Bill. The charter urged for an international bank has not been granted. The recommendation of the adoption of the metric system was only a good joke anyhow, so far as we were concerned, and its rejection was to have been foreseen. About as jocose was the proposition that we should give in our adherence to the international treaties on copyright, patents, and trademarks, adopted by the Montevideo Congress of 1888, and that, too, has been quietly ignored. The projected Latin-American Memorial Library in the city of Washington has also failed to appear.

There are left the proposed international railroad and the scheme for a monetary union, or common silver coinage. The former has been accepted, so far as to appropriate money for the initial surveys and appoint civil engineers to act in unison with those named by other countries. This is not a case, however, where it is the first step that costs, and all the immense financial and diplomatic difficulties that beset the project yet remain untouched. The naming of a Commission to study the question of an international silver coinage was regarded at the time as only a way of confessing the insolubility of the problem. If the Congress itself could not come to an agreement, there is no likelihood that the Commission can. And there would still be our own obstinate Congress to encounter, with the great uncertainties of its temper on the whole silver question. Neither of these two recommendations, therefore, can be regarded as more than tentatively accepted; yet their partial endorsement is about all that is left over of the Pan-American Congress.

In a certain sense, these results come simply to emphasize afresh the Platonic and unpractical nature of the entire undertaking. This was perceived as soon as the gathering came together. Of course, a Platonic assemblage may have valuable indirect results, and such the Pan-American Congress undoubtedly had. But its solemn deliberation for months and grave resolutions were, after all, but a simulacrum of practical action. On the other hand, the cool way in which the whole thing has been ignored by our Congress is only another evidence of the narrow views of Congressmen and their absorption in local concerns and the schemes of partisan politics. Speaker Reed's contemptuous allusion to pottering over questions of trade with "a lot of Dagoes" correctly expressed the mental attitude of the average member. Why should they trouble themselves over matters of international interest, which they could not understand, when there were private pensions to be slipped through Congress and all the thimble-rigging connected with public-building bills to be attended to?

SOME LEGAL ASPECTS OF THE FAYERWEATHER CASE.

Now that the Fayerweather will contest has been settled, the will proved, and everybody satisfied, it is proper to call attention to some aspects of the case which are of more than temporary interest. At an early period in English history it was found necessary, for feudal reasons, to enact statutes of mortmain, as they were called, by which the educational and religious corporations of that day were restrained to a considerable extent from acquiring landed property. At that period, it is to be remembered, property in land was about the only kind of property of which the common law took much account, but such is the conservatism of this law that these statutes have continued without material extension or restriction down to a time when personal property has become at least as important as realty. These statutes, we

believe, were never held applicable outside of the mother-country, and when the American colonies separated from England, they were in position to determine *de novo* their policy in this matter.

It is obvious that the result desired could be attained in either of two ways. Confining our view to testamentary dispositions, it would be equally efficacious to forbid testators giving their property to religious or educational corporations, or to forbid these corporations receiving such gifts. The latter was practically the method adopted in the State of New York, the corporations by their charters being limited in the amount of property which they are capable of taking—a principle which recently received a striking illustration in the case of Cornell University. Hence, although nominally by the statute of wills a testator was not allowed to give his landed property to any corporation, he was really hampered only by the necessity of selecting corporations upon which the Legislature had conferred a sufficient receptive capacity.

In 1860, however, a statute was passed prohibiting any testator having a wife, husband, child, or parent from giving to benevolent corporations, in trust or otherwise, more than one-half of his property. This statute was what confronted Mr. Fayerweather's legal advisers and proposed executors. He seems to have had no relatives whom he cared to enrich, and proposed to leave substantially the whole of his property to various institutions of learning. But he had a wife, and her existence raised an apparently insurmountable legal barrier to the accomplishment of his wishes. In this emergency Mr. Fayerweather's counsel seems, by a most curious repetition of history, to have resorted to one of the "dyverse and sundry ymaginacious subtile invencions and practises" which so greatly excited the ire of the common lawyers against the representatives of learning and religion in their day. These persons, to quote Spence's words, "as one contrivance for evading the laws prohibiting alienations in mortmain, procured lands to be conveyed in fee simple to some friendly hand, upon trust that they and their successors should be permitted to enjoy the profits." Although it is asserted that this trust in the Fayerweather case was not expressed in writing, it scarcely admits of doubt that it existed as a secret instruction, or at least as a tacit understanding between Mr. Fayerweather and his executors. They made themselves apparently the absolute legatees of half his estate, but the gift was unquestionably to them "to the use of" certain corporations forbidden by the law of the State to profit by this bounty.

This contrivance was very soon stopped by statute in England, so far as the ecclesiastical bodies were concerned; but the prohibition of the New York law of 1860, being without penalty, is inoperative unless invoked by some person who would have an interest in case of intestacy. That is to say, the State does not regard the matter as affecting the interests of the community, as was the case in England, but only the interests of the relatives of the decedent, and if they acquiesce the law may be disregarded with impunity. It was undoubtedly supposed by Mr. Fayerweather's counsel and residuary legatee that this acquiescence had been secured, and upon this basis the secret trust was devised. The city of New York, however, was not without lawyers of sufficient acuteness to divine the situation, and to conjecture that it might not be clearly understood by the parties interested, and this conjecture was apparently well founded. These parties withdrew their consent to the probate of the will, and the residuary legatees found themselves, so to speak, between the devil and the deep sea. It became necessary for the counsel of the testator either to confess the trust, and thus wreck the will, or else to make the somewhat awkward admission that he had used his influence with a client *in articulo mortis* to secure for himself a legacy of most preposterous magnitude.

Under these circumstances it is obvious that there was nothing for the executors to do but to surrender upon the best terms that were to be had, and while these were doubtless such as to afford the lawyers for the contestants a satisfactory compensation for their labors, it must be said that the contestants themselves displayed the greatest moderation. In fact, they might not unreasonably claim that their names as well as that of the testator should be engraved upon the memorial tablets which, after the custom of learned institutions towards their benefactors, will doubtless be set up. Should this claim be ignored, it may be apprehended that considerable casuistry will have to be employed by the authorities of these bodies in order adequately to express their indebtedness to those munificent donors, the Fayerweather legatees, who did not postpone their benevolence until they could enjoy their wealth no longer, but hastened to pour it all upon the altar of learning before they had fairly tasted the sweets of acquisition.

Yet, while we may not nowadays, with mediæval scepticism, question the sanctifying effect of the end of gifts to benevolent associations upon the means by which they are obtained, it cannot be denied that a secret trust, the terms of which are not committed to writing, and are known to the trustee alone among living men, is not in all respects the most satisfactory of means. The trustee might peradventure forget some of the conditions of the trust, or he might not always be a person of originally unimpeachable and permanently enduring integrity, or he might possibly be cut off before he could carry out the trust, leaving heirs whose consciences were not affected by a knowledge of its terms. It is true that a court of equity can ransack a secret trust so that if the trustee is perfectly veracious and of sound memory the nature of the trust will be brought to light, but these conditions may not always prevail, and the difficulties in the way of such investigations are very great. Such difficulties, however, would not deter litigants, and it is not inconceivable that some college omitted in the scheme of distribution of the Fayerweather legatees might feel compelled to demand a disclosure of the terms of the trust, upon the claim that it should have been a beneficiary. Nor can it be regarded as absolutely certain that the State would be unable to enforce obedience to its statutes. The O'Hara case, in the ninety-fifth volume of the New York Court of Appeals Reports, contains some suggestive remarks. As Lord Eldon said: "Is the Court to feel for individuals, and not to feel for the whole of its own system, and compel a discovery of frauds that go to the root of its whole system?" Judge Finch, in quoting these words, seems to consider that there is such a thing as "a fraud upon the law" as well as upon human beings:

> "If equity withholds its power, one of two things is accomplished: either the legatee holds the estate beneficially, which is a fraud upon the testatrix and the intended objects of her bounty, or the fund is devoted to unauthorized purposes, in fraud of the law and of the heirs and next of kin. . . . If in the one [case] the fraud grows out of a refusal to perform, which would be the voluntary act of the legatee repudiating his promise, and so an actual fraud, in the other it grows out of the impossibility of performance except in defiance of the public law, which is legally a fraud. In neither event can the legatee honestly hold. . . .
>
> "While it is true . . . that our statute does not forbid charitable devises and bequests, it does forbid expressly and imperatively a certain manner of making them. Gifts or transfers made in that manner are prohibited and made void. The principal legatee in this case knew it, and it was distinctly planned between him and the testatrix that her understood and declared purpose, which could not be lawfully carried out by a devise on the face of the will, should be effected by an absolute devise coupled with his honorable obligation to hold and appropriate the property to forbidden uses. An evasion of the law was the very occasion and object of the absolute devise. Without that it could not have been suggested without a fraud upon the testatrix, for if there was no need of it, if no statute was to be avoided or flanked, the very suggestion of an absolute devise was fraudulent. . . . Any devise or bequest of this character is dangerous and indefensible. It exposes testators to the suggestion of unnecessary difficulties as inducements to the artifice of an absolute devise concealing an illegal trust. It exposes the devisee to temptation, and, even when he acts honestly, to severe and unrelenting criticism."

THE EARLIEST WASHINGTONS IN VIRGINIA.

NEW YORK, February 27, 1891.

IN looking over the Washington *excerpta* of the late Col. Joseph L. Chester, by permission of his literary executor (George E. Cokayne, Norroy King of Arms), I came upon a statement that appeared almost incredible, namely, that so early as 1636 a patent was taken out in Virginia by Arthur Washington. I was aware that one of that name had a patent in Virginia in 1701, but the earlier date—a period when the great-grandfather of the President was a baby in Tring or Purleigh—was so startling as to require verification. There now appears little doubt that it is true. The fact has escaped notice through all these generations because the name was erroneously indexed in the land-book (No. 1) at Richmond as Hashington. Fortunately, Mr. Wilson Miles Cary of Baltimore, going through the book page by page, found the record (p. 408) and sent a note of it to Col. Chester. Dr. R. A. Brock, Secretary of the Virginia Historical Society, finds that in other parts of the volume the capitals H and W are hardly distinguishable. I could find no one in this country whose genealogical expe-

rience could accept "Hashington," and Dr. Garnett of the British Museum writes me, "Hashington certainly seems an impossible name." Dr. Brock kindly made a facsimile for me, and I tried to make it fit Haslington: but the "h" is perfectly formed. And, indeed, to any one acquainted with the exactness of Mr. Wilson Miles Cary, it will be conclusive that, as he tells me, "There was nothing in the character of the writing to make me persistently mistake an H for a W in patents running all the way from 1636 to 1714." For there is a succession of Arthur Washingtons in Virginia, historically traceable as far as 1701, and never genealogically connected with the Westmoreland family in that State.

The record is as follows:

To all to whom these p'sents shall come, I Capt. John West Esq'r Govern'r &c. And &c. Now know yee that I the said Capt. John West Esq'r doe with the consent of the Councell of State accordingly give and grant unto Arthur Washington twoe hundred acres of land situate lying and being in the Countie of Warwicksqueake [Warrasqueake?] joyning upon the land of Epaphroditus Lawson Easterly Northwest upon Nansimond river South East into the woods. The said twoe hundred acres of land being due unto him the said Arthur Washington for his owne p'sonall Adventure and by and for the transportation of three p'sons into this Colony whose names are in the records mentioned under this pattent. To have and to hold &c. dated the 23d of december 1636. Ut in alijs.

ARTHUR WASHINGTON. THOMAS MORGAN.
JOHN BANISTER.

This pattent renewed in the name of Gresham Cofeild the 18th July 1640.

Banister is no doubt the same as Bannaster, one or more members of which family were in Virginia in 1637 with William Stone, eleven years later Governor of Maryland.

Mr. Thomas M. Cleeman of Philadelphia communicated to the *N. E. Hist. Gen. Register* for July, 1890, a record of Surry Co., Va., that in November, 1658, John Washington was betrothed to Mary Flood, whom he married, and by whom he had one child, Richard. Col. John, the ancestor of Gen. Washington, is first mentioned in Virginia in 1659 (July). It is probable that the John who married Mary Flood was son of the Arthur of 1636. Richard married Elizabeth, daughter of Arthur Jordan, who died 1698. It has been supposed that in this way the name Arthur came into the family, but it is now certain that the earliest Washington in Virginia was of that name. The Virginia grants to the "Surry Washingtons" were in the names of Arthur (1636), Richard (1682), John and Arthur (1701), Richard (1714). The children of Richard and Elizabeth Jordan were George, Richard, John, William, Thomas, James, Arthur, Elizabeth, Priscilla, Faith, and Mary. The Hon. Joseph Edwin Washington of Tennessee, and Mr. Benjamin Gregory Washington of Isle of Wight Co., Va., are living representatives of the family, from whom I learn that Thomas, Jane, and Lucy are characteristic names of the family, to which may be added their own.

In attempting to place the family in any English race one finds these names puzzling. There are two great branches of the family—the Yorkshire and the Northamptonshire branches—so long and persistently separate that no links are known between them except their name and arms. And it happens that in the course of several centuries nearly all of the above names that are found in either are found in both. There does not appear, however, in the Northamptonshire pedigree, any James or Joseph, and only one Richard and one Gregory—the names of younger sons; whereas in the old Yorkshire family these names have persisted, the eldest sons being Richard and James as normally as those of the Northamptonshire line are Lawrence, Robert, and John. The most notable thing is that Arthur, the name of our earliest Virginia Washington, persistent on this side of the Atlantic, is unknown in either branch of the family in England. I have a note of an Arthur Savage, son of Mary Washington Savage, in the early seventeenth century, and of an Arthur Beswick who married a Martha Washington about the same time—both in England—but neither of these could have been honored in the Washington family early enough to bring an Arthur into Virginia in 1636.

There are, however, indications of a connection, possibly early enough, between the Yorkshire families of Washington and Arthur, who dwelt not far apart. In the Public Records Office (Easter, 1700, No. 254) are Chancery proceedings (1696) in a suit of Henry Washington of South Cave *v.* John Arthur of Doncaster. It is alleged by John Arthur that Henry Washington came to him as a poor lad, and, being the nephew of his wife Katharine—her half-sister's son—they took care of him, and brought him up to his (John Arthur's) own profession, the law. Henry seems to have been with the Arthurs in 1683. John Arthur also appears in a suit (1714) of Richard Washington against the Hon. Sidney Wortley, alias Montague. In all branches of the Washington family in England the custom of repeating family Christian names was adhered to.

There is a tradition in the Surry (Va.) family that they had an ancestor named Lawrence, who was an uncle or granduncle of Gen. Washington. Washington had no such relative of that name; his great-granduncle Lawrence of Rappahannock County had one son, whose name was John, concerning whose descendants the General seems to have been ignorant in 1798. In that year (April 5) he wrote to his half-nephew, Col. Wm. Aug. Washington, "I feel obliged by your endeavours to discover the genealogical descent from Lawrence Washington, the younger brother of our ancestor John." Prof. Chapman Maupin of Maryland, a descendant of Lund Washington, has made out this pedigree: Lawrence's only son John married Mary Townshend (1691); their eldest son John married Miss Massy, and the younger, Townshend, married Elizabeth Lund—all in Virginia. It will be seen, therefore, that the ancestors of the Surry Washingtons could not be in this line. They were in Virginia before Lawrence, who, in England, had only one child, Mary, whom he left there with her grandparents (Jones). The descendants of Lawrence, by his Virginia wife (Joyce Flemming), were numerous. Among them were Col. Bailey Washington of Stafford, Virginia, where some of his many descendants reside, those of his son Col. William Washington, hero of Cowpens, residing in South Carolina. Possibly there was some marriage between the two branches in Virginia, for the father of the Hon. Joseph E. Washington was George Augustine (born 1815). The traditional descent from the General's granduncle may, therefore, have been maternal.

The "Surry Washingtons" use the eagle crest, normal, I believe, in the Yorkshire family. This, again, is not conclusive, for Burke mentions it as a subordinate crest of the Northamptonshire family, whose crest was a raven. The eagle was also used by the General's grandfather, and by himself in one instance (1758). But the Surry family alone have preserved it. This fact, the repetition in Virginia of the names in the main Yorkshire line—Richard, James, Joseph—and the absence at any early date of any Yorkshire or Virginia Lawrence (the most characteristic name of the Northhamptonshire and Westmoreland [Va.] line), point to a Yorkshire origin for our Surry Washingtons. The fact that they have lived in Virginia for two and a half centuries beside the other branch, without any common stem being found by Dr. Brock and other experienced genealogists, corresponds singularly with the similar phenomenon in England. There also the Yorkshire and Northamptonshire branches, growing side by side, have never been united in one pedigree. There, too, a tradition of relationship to the General's ancestors is cherished by descendants of the Yorkshire Washingtons. In the family of Richard Almack, F.S.A., there is preserved a Bible inscribed, "Ann Washington, ye gift of Elinor Washington." "Elizabeth Idoll, her book, 1729." John Idoll, Gent., of South Cave, Yorks., married Anne, daughter of Henry Washington (1719), also of South Cave, as we have seen by his suit with John Arthur. This Henry married Eleanor Harrison (1691) and the Hon. Henry Fairfax married her sister Ann, both being daughters of Richard Harrison of South Cave. A son of this Henry and Ann was William Fairfax, who came to Westmoreland in 1734, and whose daughter married Washington's half-brother Lawrence.

This casts some light on a sentence in Washington's letter to a kinsman of that family, Earl Buchan (1793); "The family of Fairfaxes of Virginia, of whom you speak, are also related to me by several intermarriages before it came to this country (as I am informed), and since." It is plain that the General believed himself to be of the Yorkshire family, since with that alone the Fairfaxes were connected; though, unless Col. John's first wife was a Fairfax, it is not easy to guess the "several intermarriages." In 1790 he wrote to Baron von Washington of Munich, unquestionably of that line: "There can be but little doubt, Sir, of our descending from the same stock." In 1792 Sir Isaac Heard, King of Arms, suggested the Northamptonshire lineage. He answered, "I have often heard others of the family, older than myself, say that our ancestor, who first settled in this country, came from some one of the northern counties of England; but whether from Lancashire, Yorkshire, or one still more northerly, I do not precisely remember." The later letter to Earl Buchan suggests that his impression had returned to Yorkshire. This impression is sufficiently justified if we adopt the no doubt well-considered assertion of Sparks: "John had resided on an estate at South Cave in Yorkshire, which gave rise to an erroneous tradition among his descendants, that their ancestor came from the north of England."

John Washington came to Virginia as early as July of 1659. He brought a wife and two children, and a son was born in September. It is a pretty straight story that he lodged a complaint against the ship's captain for the execution of a passenger, Elizabeth Richardson, as a witch. Mr. F. A. Winder (London *Athenæum*, July 19, 1890) notes that two of the Washingtons had by marriage the name Elizabeth Richardson, one being a grandaunt of the immigrant; but we may reserve our horror at the suggestion. His wife having died, John married the widow Brodhurst, *née* Ann Pope. In 1671 (Oct. 2) John received 560 acres on the Rappahannock for transporting to Virginia William Gerley, Mary Jones, Wm. Grant, George *Gregory*, Grace Langley, Wm. Gray, James Bryant, Thomas Gresham, Martin Gardner, Wm. St. John, Anthony Glover, John Thorpe. Gregory was a name used by the Yorkshire Washingtons. In the Chester

excerpta (MS.) is noted a discovery of John Ward Dean, Boston, Mass., that there was a family of Wrights at Plowland, near South Cave, where the Rev. Francis Wright died 1655. In Virginia Major Francis Wright married Col. John Washington's daughter (by his first wife) Anne. The Yorkshire pedigree begins with the marriage of Richard Washington to Jane Lund, one of an ancient family at Adwick-le-Street, Yorkshire, not far from South Cave. We find an early intermarriage between the same families in Virginia. And here were those Jordans (Yorkshire), one of whom was Arthur; also, the Harrisons of South Cave, probably ancestors of President Harrison, some of whom appear to have been in Virginia with the earlier Surry Washingtons.

These facts present a balance of probabilities that John Washington was sojourning at South Cave when reports came there from Arthur Washington's family, and perhaps the Jordans and Harrisons, telling of prosperity in Virginia, and that he emigrated about the same time with the Wrights, Lunds, Gregorys, Whitings — all Yorkshire — with whom his family intermarried in Virginia, and among whom he himself may have found his first wife. John was loyal and impecunious enough to emigrate. His will shows no property in England except money, some of which he bequeaths to buy the King's arms for Washington's parish church. I found evidence in the Public Records Office, England, that his money there was for shipments of tobacco: "Feb. 20, 1676. To Coll. John Washington wch hee hath from the account of charges from Westmoreland County, 2000. £80." In June, 1675, Coll. John is credited with £33.9.3, and contra £223.2 0. He and Maj. Allerton are in one instance credited with 12,000 lbs. tobacco. Another entry is: "To Coll. Augustine Warner, £40. To Coll. John Washington, £80. Acct. sent by Robert Beverley, Clk. Assembly. Date April 2, 1677." MONCURE D. CONWAY.

THE REACTION IN JAPAN.

TOKYO, February 12, 1891.

"THAT is the point which decides the welfare of a people: *Which way does it look?* If to any other people, it is not well with them." These words of Emerson's may be called to mind in connection with the reaction which has progressed so rapidly in this country within the last six months. Japan has for twenty years been guided by European standards; the essentials of foreign art, science, industry, and manners were eagerly absorbed, and in the past few years even the non-essentials—velocipedes and waltzing, for instance—became the fads of the day. Now the natural reaction has set in. As English law in the thirteenth century, German literature in the last quarter of the last century, and American thought in the middle of the present century, began to repudiate foreign models and to enter on the process of national development, so Japan is retiring upon itself to assimilate the useful portions of that which it has adopted, and to do what every virile nation must naturally and inevitably do, develop its institutions upon the lines marked out by its own history and temperament.

Some examples will convey an idea of the way in which this attitude is manifesting itself. It is, of course, more marked in particular departments; art, for example, and pure science being as yet scarcely involved. At the present moment one may say that it is a matter of sentiment rather than of judgment, and it may be looked for in almost any quarter. In education, perhaps, the tendency is most notable. The foreign schools in which the staple material is foreign learning have shown (though, of course, not in every case) a decided falling off. In one instance two schools have been amalgamated, one of which a few years ago had 300 pupils, the other 150; now they muster together only 150 or thereabouts. The ranks of the foreign instructors in the Imperial University have been seriously thinned, and their places are being filled by young graduates of promise, and the process has included even the representatives of German science, which has of late been in the highest favor. Parliament has questioned the policy of educating students abroad at the expense of the State, and it is likely that the number of these students will be gradually reduced. The students who are taught here in foreign languages are not found to be so ardent as in former days in the acquisition of the foreign tongue, and the task of conveying such instruction has become correspondingly difficult. In the matter of laws, too, the postponement by Parliament of the operation of the Commercial Code until 1893 is significant. It is a close adaptation of the German code, and its repugnance to the customs of the country was the strong point with its opponents. Parliament is very anxious, too, to know whether it is necessary to maintain so many foreign advisers and superintendents in the Government departments, and the Ministry is placed always in an attitude of defence and explanation, not to say apology.

In religion, too, the reactionary movement is strong. The recent action of the Presbyterian Synod in adopting a national creed of its own (practically the Apostles' Creed, with a short preamble) instead of the Westminster Creed, is but one instance. The delegates would not even accept foreign initiative in drafting their new creed. But, curiously enough, the draft adopted, which they thought emanated from a committee of their own number, was in fact the work of a foreign clergyman. So strong was the feeling on the subject that the Synod refused to retain an article of the constitution permitting foreigners to become members of the Synod by special vote. They quite intended to include the foreign workers, but they objected to any article which even seemed to grant a special privilege to foreigners; and accordingly the word "foreign" was eliminated, and the privilege was left open to any person—though in practice only the foreign workers will receive the benefit of it. This was paralleled by the debate in the Peers over the new weights and measures project. In the course of this it was seriously contended that even if the metric system was in fact adopted, it was derogatory to the national dignity formally to mention the new measures in the statute as "the French metric system." This opinion was advanced repeatedly, and the final vote adopting the objectionable section was only 66 to 37.

Commercial affairs are hardly disturbed by this impulsive patriotism. One reads that the Osaka Mint has decided to use a certain number of home-made crucibles, though the foreign ones are admitted to be of better quality; and some attempts are being made to procure subsidies for the tea and silk export trades, on the plea of retaining in the pockets of citizens the profit of the foreign middleman. But, on the whole, sentiment enters but little into business. There is, however, a slight falling off in woollens and dress goods, due partly to the tendency to return to native costume. One hears, too, of Paris dresses, never worn, which their owners would now like to dispose of privately. The desire to expedite treaty revision had not a little to do with the adoption of foreign dress by the Court, and it is to be hoped that the imperial household will soon see its way to rescinding its regulation.

Of the causes for all this, we may put down as one the natural reawakening of the *pro patria* sentiment, ever a strong one in Japan. The *patria* of Japan was of old the *kuni*, or clan home; now it is the whole land. The affection for the native soil is no longer a divided one: it has but a single object, and it burns the stronger. Parliament's particularly pronounced action is in part accounted for by its desire for economy, and this force naturally expends itself along the line of least resistance. Other causes, too, help to facilitate or retard the expression of the sentiment in question. But it is undoubtedly a popular sentiment—which must be understood with these limitations, that an immense number of people, below in the scale, do not care or think much about the subject, and that, at the other extreme, the Government knows too well the value of its foreign assistants, and is too little swayed by prejudice, to partake really in the movement: in whatever it has done or will do it only obeys what public opinion requires. There is, of course, something of the factitious about it all. The new patriotism serves as a politician's war cry, just as "Jo-i" (Expel the foreigners!) did in the sixties, and just as the Cobden Club gold and Lord Sackville West's letter have done with us.

It is easy to sympathize in the abstract with this feeling. At the same time it must result in retarding Japan's acquisition of adequate expertness in foreign arts and sciences, while it adds serious obstacles to the work of foreign students here, and makes it more than ever difficult to pursue investigations in the numberless attractive themes that clamor for attention. On the other hand, it is stimulating the spirit of self-development. Domestic industry will profit greatly, and the native scholars are turning to their own historical institutions with a truer sense of their value, and with a new zeal which will in the end give us the most valuable results. J. H. W.

TALLEYRAND'S MEMOIRS.

PARIS, March 5, 1891.

THE long-expected memoirs of Prince de Talleyrand have appeared at last. Four years before his death, on January 10, 1834, he made his will, and two years afterwards, October 1, 1836, he added to it a declaration which was a kind of short *Apologia pro vita mea*. Looking over his long life (he was then eighty-two years old), he said, with a mixture of solemnity and of pride, that "recalling to himself the numerous acts of his political life (which had been long), he found, in brief, that of all the governments which he had served, there was none from which he had received more than he had given; that he had abandoned none before it had abandoned itself; that he had placed the interests of no party, nor his own interests, nor the interests of his family in the balance with the *true* interests of France, which were not, in his opinion, in opposition to the *true* interests of Europe." After this declaration come some prescriptions relative to the keeping and the publication of his memoirs.

The Duc de Broglie has written a preface in which he gives all the details respecting the various persons who received the memoirs in trust. He has himself been charged with the mission of publishing these memoirs, and no better person could have been found for the purpose. The Duc de Broglie has allowed himself no retrenchment or modification of any

sort of the text prepared by Talleyrand for publication. The memoirs are divisible into two portions: the first begins with the youth of Talleyrand, and goes as far as 1815, to the close of the Ministry of which he was a member. The Duc de Broglie judges that this part of the memoirs was composed under the Restoration. The two volumes which now appear end with the Congress of Vienna in 1815. The second part of the memoirs begins in 1830, with Talleyrand's embassy to London, and was probably written in 1834. There is therefore a gap of fourteen years.

The public life of Talleyrand is so well known that it was natural that public interest should be especially awakened by the first part of the memoirs. Talleyrand was born in 1754. His father was Lieutenant-General and held office at court. His own education was neglected: "Multiplied cares would then have seemed pedantic; a tenderness too much expressed would have seemed something new and consequently ridiculous. Children then were the heirs of the name and arms. People thought they had done enough for them by arranging for some promotion, places, entails, by marrying them or augmenting their fortune." Talleyrand, as a child, had been confided to a woman in the faubourgs of Paris. She once let him fall from a commode; his foot was broken, the accident was neglected, and for his whole life Talleyrand was lame. He could therefore not enter the army and he was destined for the Church. His grandmother, Mme. de Chalais, who lived in Périgord, seems to have shown him some affection, but he was almost a stranger to his father and mother. He pursued his studies in Paris in the Collége d'Harcourt, and from Paris he was sent to Reims, where his uncle was assistant to the Archbishop. He did not see his parents before his departure. "I am perhaps the only man of distinguished birth and belonging to a numerous and esteemed family who never had, for one week of his life, the happiness of finding himself under the paternal roof." It is no wonder if, under such circumstances, the emotions of youth were never felt by him, and he became unnaturally cold and reserved. After a year spent at Reims, reading the memoirs of Retz, Richelieu, and Ximénès, placed in his hands in order to prepare him for the Church, he spent three years at Saint-Sulpice. He fell in love, in one of the chapels of the church, with a girl who was on the stage; she allowed him to visit her. Her parents had made her an actress against her will; he was a reluctant seminarist. His superiors shut their eyes on this love-affair; they had no reproaches to make to a young seminarist whom they thought destined to the highest position, who might become a cardinal, perhaps a prime minister.

Talleyrand left the seminary at the time of the coronation of Louis XVI. He witnessed this great ceremony, and made, at Reims, the acquaintance of some ladies who remained his friends, the Duchesse de Luynes, the Duchesse de Fitz-James, and the Vicomtesse de Laval. He saw soon afterwards a General Assembly of the clergy: "When the pecuniary interests of the clergy were attacked, the resistance was general." Talleyrand soon perceived all the worldly passions which lurked under the spiritual mask. After the Assembly, he entered the Sorbonne, where he spent two years, much more occupied with his pleasures than with theology, and having at times an ambitious dream before the fine mausoleum of Richelieu. The King gave him the Abbey of Saint-Denis at Reims, which insured him a good revenue; he began to form a good library, and lived in the world chiefly with M. de Choiseul, M. de Narbonne, and others. The life of our abbé was an easy one. His rooms, where his friends could find a breakfast every morning, presented a singular motley of men—the Duc de Lauzun, the Abbé Delille, Mirabeau, Chamfort, Dupont, De Nemours, Rulhière, Choiseul, Louis de Narbonne. Everything was discussed—questions of trade, of administration, of finance; the spirit of the Revolution was already felt. Talleyrand saw the best company of Paris and made visits to his mother.

"She had no pretensions; she only spoke in half tones; she never uttered a bon-mot—it was too pronounced. Bon-mots are remembered, and she wished only to please and to have what she said forgotten. She inspired me with a great dislike for people who, in order to speak more exactly, employ technical words. I do not believe in the *esprit* or the knowledge of people who do not know equivalents, and who are always making definitions; they owe all they know to their memory, and then they do not know well."

I have transcribed this passage in order to show that Talleyrand, though he did not wish to be considered a writer, knew how to write; he could express very delicate shades of thought, and had a curious fluidity of style.

The life of Talleyrand while he was an abbé was obviously very unedifying. He soon made for himself the reputation of a wit; he became a visitor of Mme. de Montesson, the morganatic wife of the Duc d'Orléans, who had a theatre. "At her theatre, there was for the slightly dissipated clergy a box to which I was admitted by the Archbishop of Toulouse, the Bishop of Rodez, the Archbishop of Rodez, the Bishop of Comminges." In 1775, he was delegated to the Assembly of the Clergy. These Assemblies were periodical and contributed to the public expenses by a "don gratuit" made to the King out of the then enormous revenues of the Church. Talleyrand soon perceived that they would not sacrifice any of their privileges. His mind began to work on questions of finance, which was then assuming a great importance. He gives an amusing account of the state of a society which combined amusement with political criticism, and discussed a literary topic with as much ardor as a financial reform. All ranks were mixed, though the spirit of caste was omnipotent; "cards and *bel esprit* had confounded everything." "I remember," he says, "that at a ball, between two quadrilles, Mme. de Haïl was explaining what was the *domaine d'Occident;* Mme. de Blot had opinions about all the officers of the French Navy; Mme. de Simiane thought that no duties ought to be levied on Virginian tobacco. . . . 'There is much more learning in the Parlement of Rouen than in the Parlement of Paris,' said Mme. de Hénin." The power of what is called Society was immense before the French Revolution, and the powers of the Government had become purely nominal. There was no real statesman in power, no leading mind; in consequence, everybody made plans. The American Revolution had given a great impetus to the spirit of reform, the philosophers had attacked all the ideas of the past, the economists were a new class of philosophers who aimed to change everything in the State; everything was in a state of fermentation and confusion.

Talleyrand seems to have incurred, after the necklace trial, the displeasure of Marie Antoinette by reason of his intimacy with some of the people who had judged the Queen with severity; at any rate, he says that the Queen contrived to deprive him of a Cardinal's hat, which Pope Pius VI. was willing to confer upon him. She invoked the influence of the Court of Vienna against this nomination. It is not impossible that this circumstance may have had something to do with Talleyrand's attitude when the Revolution began.

It is interesting to compare Talleyrand's notes on the state of French society before the Revolution with those, for instance, of Mme. de Genlis and of Gouverneur Morris. We get everywhere the same impression: we see a society in a state of decomposition, a mixture of worldliness with an ignorant preoccupation concerning all sorts of social and political problems, high aspirations and no experience, great hopes without any special direction; the spirit of caste and the rising spirit of equality, contempt of the past and inability to imagine anything new and definite. In the crisis which was produced by the state of the finances, the States-General were considered a kind of panacea; the Opposition also regarded Necker as a saviour. Talleyrand did not feel a great admiration for Necker.

"Perhaps," he says, "in ordinary times he might have done some good; I do not know, and, personally, I do not think so. But what I am sure of is, that in 1788 the King could not have made a worse choice. During a national crisis, to put at the helm a stranger, a *bourgeois* of a little republic, whose religion was not that of the majority of the nation, with mediocre talents, full of himself, surrounded by flatterers, without any consistency and obliged to please the people, was for the King to address himself to a man who could only convoke the States-General and do it out of season."

The States-General were composed of deputations from the three orders of the nation; nobody was of necessity a member of them or could become so without an election. Necker fixed the number of the deputies, and fixed too high a number. Talleyrand thinks that it would have been wiser to form a peerage, similar to the English peerage, out of members of the episcopate and of the old French nobility, and to have a second chamber composed of elected deputies. Two chambers would have formed the elements of a true parliament, and rendered constitutional government possible. A single chamber, divided into three hostile parts, was sure to become very chaotic, and in reality the spirit of the times was such that it might easily have been prophesied that the *Tiers*, the commoners, would soon carry all before them, and sacrifice the interests, not only of the Church and the nobility, but of the Crown. The privileges of the nobility and clergy were monstrous, and the *Tiers* was determined to abolish them. It had shown its true spirit in the famous pamphlet of the Abbé Sieyès, 'Qu'est-ce que le Tiers? Rien. Que doit-il être? Tout.'

A struggle, a death struggle, was imminent: what position was Talleyrand going to take? His great intelligence showed him clearly the dangers of the situation, but he had not enough influence to force on the King and on the three orders the English ideal of constitutional government.

Correspondence.

THE FIFTY-FIRST CONGRESS.

To the Editor of The Nation:

Sir: If we were to look for the one characteristic which would especially describe the Congress which has just closed, it would be this, that it was wholly given up to legislation for private, local, and party ends, with an almost complete disregard of the interest of the mass of the nation. The McKinley Bill, the Force Bill, the Silver, and Pension, and Subsidy Bills—all these were distinct and

almost unquestioned jobs, intended to put money and party influence into the hands of individuals. It is true, the national will and conscience were strong enough to kill the Force and Free-Coinage Bills, but this was only a negative upon propositions so monstrous that the Government of Constantinople might have been ashamed of them. Perhaps the one shining exception which proves the rule, and stands almost alone in paying some regard to the national honor and interest, is the International Copyright Bill.

It is unjust to charge this state of things to the individual members, as Congress is perfectly organized to produce it and to produce nothing else. I should be ashamed of such repetition, did I not earnestly desire to fix the attention of your readers upon this circumstance, that the national interest has no representative in Congress. Every man who has voice or vote in either house represents either a State or a district. Everything that he does or says on behalf of his immediate constituents is quite in order. But if he goes out of his way to defend the national interest on any other than party grounds against local or private attacks, he is snubbed and regarded as impertinent. Again, the 300 and odd members in one house and eighty in the other are all precisely equal, without any official or even party leader to look up to. They are like a lot of drunken men who can only stand up by holding on to each other, and even so their condition is so perilous that they keep trying to set up posts for the "end men" to lean against. Does anybody suppose that Mr. Lodge cares two cents about the Force Bill? It is simply an attempt to fling out a banner gaudy enough to attract the support of the so-called national Republican party.

If anything is to be got through Congress, therefore, it is never presented and discussed from a national point of view, but the struggle turns upon securing for its support, by intrigue, persuasion, or worse motives, the greatest number of equal and separate units—a game in which private schemes have an overwhelming advantage—and thus backing them up by a public opinion artificially manufactured through party newspapers, and such combinations as the Farmers' Alliance, the Grand Army, the Knights of Labor, etc. The supposed public demand for free coinage turns out, in the light of the Wisconsin resolutions and the Fanueil Hall meeting, to be, in fact, no public demand at all, while the so-called liberality of pensions to soldiers and sailors is, in fact, a scheme of pension-agents in Washington who want a large sum by way of commissions. It is this kind of management which is converting our large financial surplus into an equally large deficit, if, indeed, anybody knows anything about the matter at all.

It is idle to expect any improvement from a change of men, as under such a system Congress does and will go from bad to worse; and equally idle to expect it from substituting Democrats for Republicans, as the latter have some traditions of organization, even though on bad principles, while the Democrats will be like sheep without a shepherd. The remedy must be sought where the disease is. There should be representatives of the national interest in Congress, who can only be the Cabinet officers. They would be at once leaders, whom independent members could look up to and follow instead of being obliged to stumble for a footing in the meshes of party intrigue, and embodiments of great national questions to excite personal enthusiasm in the mass of public opinion. We have seen what that public opinion could do in the civil war with Lincoln, and Grant, and Sherman at the front. It may speak again in tones of thunder if only it can find competent leaders to direct its energy in civil affairs. G. B.

Boston, March 14, 1891.

THE RECESSION OF THE NIAGARA GORGE.

To the Editor of The Nation:

Sir: The recent publication of the Journal of William Maclay, Senator from Pennsylvania in the first session of Congress, brings to light an earlier observation of the recession of the Niagara Gorge than geologists have hitherto had at their command. Before the survey of Prof. Hall in 1842 the only data were local observations. Bakewell, in 1829, was told by "Mr. Forsyth, the proprietor of the Pavilion Hotel on the Canada side, that during his residence of forty years the Falls had receded forty yards" (*Am. Journal of Science*, May, 1857, p. 85). Sir Chas. Lyell, in 1841, estimated the rate of recession at one foot a year. The passage in Maclay's Journal takes back popular observation thirty years, and, so far as any dependence can be placed upon it, confirms the observation of Lyell. It reads as follows:

"February 1st [1790] . . . Mr. Ellicott's accounts of Niagara Falls are amazing indeed. I communicated to him my scheme of an attempt to account for the age of the world, or at least to fix the period when the water began to cut the ledge of rock over which it falls. The distance from the present pitch to where the falls originally were is now seven miles. For this space a tremendous channel is cut in a solid limestone rock, in all parts one hundred and fifty feet deep, but near two hundred and fifty at the mouth or part where the attrition began. People who have known the place since Sir William Johnson took possession of it, about thirty years ago, give out that there is an attrition of twenty feet in that time. Now if 20 feet = 30 years = 7 miles or 36,960 feet; answer, 55,440 years."

With that fertile thought anticipating one of the greatest of modern geologists a half century in suggesting the recession of the gorge as a geological chronometer, the keen-witted politician dropped the subject. One feels that Ellicott must have dismissed the scheme as a vagary. Upon turning to Appletons' 'Cyclopædia of American Biography,' to learn more of Mr. Ellicott, the following interesting fact, apparently unknown to all writers on the gorge, was discovered: "He [Ellicott] was selected by Washington in 1789 to survey the land lying between Pennsylvania and Lake Erie, and during that year he made the first accurate measurement of the Niagara River from lake to lake, with the height of the falls and the descent of the rapids." Ellicott's papers would seem to be still in existence, according to the article, and the results of this measurement ought to be accessible either in his printed papers or MSS. Supposing them to be found, then instead of the hitherto known data for calculation, viz., local observation from 1789 to 1829–1842, and surveys from 1842 to 1883, we should have: local observation from 1759–1789, measurement by a skilled engineer in 1789, to be compared with the survey of 1842, and then on as above. In view of the varying conclusions reached by geologists, it is to be hoped that these additional facts may prove of service in the discussion. In connection with this, the popular observation from 1759 to 1789 might be checked by comparison with the careful description of the falls by Kalm, printed in the *Gentleman's Magazine* for January, 1751, the main points of which are quoted by Mr. Garbett (*Nature*, vol. xxxii., p. 244).

Perhaps it is well to state that Mr. C. K. Gilbert of the United States Geological Survey, from the data afforded by recent surveys, estimates the age of the gorge at about 7,000 years; and Prof. G. Frederick Wright, after comparison of the phenomena of the gorge with those of several gorges in northern Ohio, decides in favor of this short estimate as against Lyell's of about 35,000 years. It is hardly necessary to say that the great interest of this question arises from the fact that the cutting of the gorge is generally held to have begun with the retreat of the ice-sheet at the close of the last glacial period. The calmness with which Senator Maclay figured out the age of the gorge at 55,440 years, in 1790, is very remarkable, when one remembers that Hutton's 'Theory of the Earth' was first separately published in 1795; that Buffon, in 1751, was forced by the Theological Faculty of the Sorbonne to say, "I abandon everything in my book respecting the formation of the earth, and, generally, all which may be contrary to the narration of Moses," and that in 1758 the botanist Gesner rejected a theory of the formation of the Apennines on the ground that it required about 80,000 years, or more than ten times the age of the world. Edward G. Bourne.

Adelbert College, Cleveland,

"*ADVANCIVE.*"

To the Editor of The Nation:

Sir: As you point out in p. 159, col. 1, the ill-formed word named above was used by Washington in 1779 and 1785. But it was in print more than a century earlier, as appears from the subjoined passage, which I came on some time after Dr. Murray had passed the letter A:

"Have, then, the so many magnificent structures of your Colledges been devis'd only to delude the People with a deal of pretty talk not a jot *advancive* of Reason?" Rev. Thomas White, *An Exclusion of Scepticks*, etc. (1665), *Preface*.

The work here quoted is in answer to the Rev. Joseph Glanvill. Its author, a learned, but eccentric, Romish priest, wrote largely in English and in Latin. His name he latinizes as Thomas Albius and Thomas Anglus ex-Albiis East-Saxonum. His native county was Essex. He died in Drury Lane, London, in 1670, at the age of ninety-four.—Your obedient servant, F. H.

Marlesford, England, March 4, 1891.

P. S.—In many instances, an early occurrence, if not the first, of a word which, though now common, is usually supposed to be of very recent origin, is found in some unfrequented corner of oldish literature. The substantive *pervert* was used by the first Earl of Orrery in 1666, and repeatedly by Myles Davies in 1716. Before the days of Lord Shaftesbury, John Evelyn, between 1657 and 1683, has *cult*, which was preceded by *culto* in 1588. *Educational*, as I have shown elsewhere, dates from 1652, at least. *Hygeist* and *physicist* were in print in 1716. And so I might go on; but I shall stop, after noticing the monstrous *bathetic*. This term is generally thought to be Coleridge's; and, quite possibly, Coleridge was not aware that he had been anticipated in venturing it. "Pathetic and *bathetic*" writes, however, the anonymous author of *A Piece of Family Biography* (1799), Vol. III., p. 16, as I have just discovered. And he asks, in a foot-note: "Why not *bathetic* from *bathos*, as well as *pathetic* from *pathos*?" That *pathetic* is not from *pathos* is Dr. Murray's very sufficient answer. F. H.

Notes.

An Atlas of the State of New York is contemplated by the well-known house of Julius Bien & Co. of this city, who stand at the head of our map-making establishments. It will embrace a general map, county maps, street maps on a large scale of the principal cities, temperature and rainfall maps, etc., with an alphabetical register showing the population at the last census, and a list of post-offices. The price will be $30. The enterprise awaits public encouragement, which can hardly fail.

Harper & Bros. have nearly ready Kobbé's 'New York,' a hand-book for tourists and visitors to the metropolis, on the pattern of Baedeker.

The first of the five volumes of the Talleyrand Memoirs will be issued by the Messrs. Putnam in a few days. Mr. Whitelaw Reid's introduction will be accompanied by a preface by the Duc de Broglie, and besides four portraits there will be some pages of MS. facsimile. The second volume will shortly follow. Notice is given that single volumes may be purchased. The same firm will publish at once, in their "Questions of the Day" series, 'The Question of Copyright,' consisting of the text of the new American law, of the older law, now superseded, of the British law, etc., the International Copyright Convention at Berne, Sept. 5, 1887, and many other important documents, essays, etc., on the general subject.

D. Appleton & Co. announce an anonymous work, 'The Sovereigns and Courts of Europe,' with a recent portrait in each case, engraved on wood.

'Gray Days and Gold,' by the well-known poet and critic William Winter, a companion-book to the 'Shakespeare's England' of the same author, will be published by David Douglas of Edinburgh in his American authors series, in April.

The edition of Sherman's Memoirs for which, as we have already recorded, Mr. Blaine is preparing a contribution in the nature of an appendix, is a cheap one in a single volume, with the imprint of Charles L. Webster & Co.

The Cassell Publishing Co. project a "Blue Library" of select fiction, beginning with Mme. Bazán's 'A Christian Woman,' translated by Rollo Ogden. They have just made arrangements, also, to publish the novels of Mr. J. M. Barrie, beginning with 'A Window in Thrums.' As the publishers of Marie Bashkirtseff's 'Journal,' they offer to receive American contributions towards a proposed monument to this artist in Paris.

Mr. Winfield S. Nevins of the staff of the Boston *Herald* has written for early publication a history of the Salem witchcraft, with some reference to the delusion in other parts of New England two centuries ago.

Ginn & Co. have in press 'The Children's Primer,' by Miss Ellen M. Cyr, and a new (the third) edition of Dr. Keep's 'Essential Uses of the Moods [in Greek and Latin].'

Mérimée's most charming story, 'Colomba,' is about to be brought out by D. C. Heath & Co., with an introduction and notes by Prof. L. A. Fontaine of the University of Mississippi.

The *Globe* Publishing Co. of Atchison, Kan., will begin in April *Howe's Quarterly*, composed of the writings of E. W. Howe, author of 'The Story of a Country Town.' 'An Ante-Mortem Statement' is the title of the first story; 'The Confession of John Whitlock, late Preacher of the Gospel,' of the second (July), etc.

Mr. Edward Robinson's new catalogue of the casts from ancient sculpture in the Boston Museum of Fine Arts will shortly appear, being actually in the press of Houghton, Mifflin & Co.

Judged from the sample before us, 'The Fishes of North America that Are Caught on Hook and Line' will meet with a hearty welcome from all admirers of the beauties in the waters, and will be an especial delight to anglers. The author, Mr. Wm. C. Harris, editor of the *American Angler*, *Nature's Realm*, etc., is well equipped for the task he undertakes. The book is in folio, and is issued in parts, each to contain a couple of the beautiful life-color portraits with text. The plates are reproduced from oil paintings. It is estimated that an expense of $45,000 will be necessary to place the work on the market. A great deal of encouragement will be needed for an enterprise on such a splendid scale; it will deserve it, and it will be pretty sure to get it. Drawings and text are both so admirable that one dislikes to find fault with either. No doubt the author will gratefully prefer to have his attention directed to a weak point in the nomenclature before it is too late to profit by it. The Rocky Mountain trout is called "*Salmo mykiss*—Jordan"; it is *S. mykiss* (Pall.) Pennant, of 1784. The maskallonge is called "*Lucius masquinongy*—Jordan"; though not indicated, this is probably *Esox masquinongy* Mitchill. Here the generally accepted name of the genus, *Esox* of Artedi and Linné, 1738–66, and of subsequent authors, is set aside for *Lucius* of Klein and Walbaum, 1792, which we do not believe will be accepted for any length of time, if at all. Credit that should go to Pallas for other names is given to Walbaum.

Mr. Charles Ledyard Norton's glossary of 'Political Americanisms' (Longmans) does not rise above the amateurishness of the magazine article of which it is the outgrowth. Nor does it afford a tolerably satisfactory basis for a more perfect structure. The definitions are loose and ill-worded, not seldom incorrect (as when *buncome* is defined as talking for talk's sake); the etymologies are often hazardous, and Webster's improbable derivation of *caucus* is retained, though it has been abandoned by the latest editors of the Dictionary itself; there is too much guessing (as where "it is believed that Andrew Jackson was the first to resort to the pocket veto, in 1830," whereas President Madison resorted to it in the first session of the Twelfth Congress), and too much positiveness (as when Mr. Norton asserts that Burchard's "Rum, Romanism, and Rebellion" turned the election in New York against Blaine); there is no proportion in the amount of detail, nor any sure principle of inclusion; nor has the author's research done much if anything to fix with precision the origin of words and phrases. In short, Bartlett's 'Dictionary of Americanisms,' and especially Brown & Strauss's 'Dictionary of American Politics,' with the "noted sayings" gathered together in Stedman & Hutchinson's 'Library of American Literature,' at once make Mr. Norton's work uncalled for (with some trifling exceptions), and reveal by comparison its imperfections.

The damnatory record of Belle Isle, Salisbury, and Andersonville is of the past; but those who suffered or whose friends suffered there will repeat the dreadful story, of which there seems to be no reasonable denial. Asa B. Isham, Henry M. Davidson, and Henry B. Furness, ex-prisoners, have prepared, in three parts, a large volume, 'Prisoners of War and Military Prisons' (Cincinnati: Lyman & Cushing). The book is free from material exaggeration, but is popular rather than precise in tone, and the most valuable section is Mr. Furness's, with copious extracts from Confederate sources. Official records have no undue bias in favor of the enemy. Necessarily cruel as organized conflict is, no darker record of man's inhumanity to man has blotted the history of modern warfare. Much distress, but distress rarely inflicted with deliberation, marked Fort Delaware, Elmira, Point Lookout, and perhaps other Northern prisons; but, mercifully, these did not rival those. Savannah, ever fair and hospitable, has the one redeeming page in that sad history.

Macmillan & Co. have issued the fifth thousand of Walter Pater's 'Marius the Epicurean,' which is now not unhandsomely condensed into a single volume at a reduced price.

In like manner, Spencer Walpole's 'Life of Lord John Russell' takes on a more popular and cheaper form, if still in two volumes, in the edition just issued by Longmans, Green & Co. In both these cases the hand is favored as well as the pocket.

The son of the late President Woolsey has supervised the sixth edition of the well-known 'Introduction to the Study of International Law,' of which the fifth was published a little more than ten years ago. The revision is readily detected by the bracketing of what Mr. Theodore S. Woolsey has added, and it is evident that he has thoroughly scrutinized the original text. As a consequence, the work has been wholly reset, as is always to be desired.

Mr. Lewis Sergeant's 'Government Handbook' (New York: Frederick A. Stokes Co.) is the same author's 'Government Yearbook' of 1888, 1889. He has discovered the impracticability of making an annual of his "record of the forms and methods of government," and will henceforth renew the work only when there is a sufficient accumulation of changes. Statistics, in other words, occupy a subordinate place. Nevertheless, if admitted at all, they should be kept fresh, and yet all those pertaining to the United States remain as in the first issue. The most of them stop at 1887, and there is a guess of 65,000,000 as the total population in 1888, with no allusion to the census of 1890 and its disappointingly low figure of 63,000,000. The addenda to the United States, on "political tendencies," are quite worthless, and close with a page and more of spread-eagleism from Chauncey Depew. There are still no head-lines to the pages, and the new edition has very few signs of life.

Mr. Keltie, on the other hand, in the 'Statesman's Year-Book' for 1891 (Macmillan), has availed himself as far as was possible of our latest census returns; and generally his work shows the needful revision. The alternate headlines have been used to indicate the sections under discussion. In this case we are dealing with a live publication, now in its twenty-eighth year.

Germania, whose bound second volume lies before us, appears to have made a substantial success in its line of furnishing entertaining reading in German and of affording practical help in the way of exercises, etc., to students of the language. Its place of publication is not the West, but the East (Manchester, N. H.: A. W. & E. Spanhoofd). We can recommend it as cheap, well printed, and well conducted. It is a monthly periodical, of quarto size, and employs liberally (though not exclusively or mainly) the Roman letter.

From R. H. Tilley, Newport, R. I., we receive the first number of a new quarterly *Magazine of New England History*, "a medium of intercommunication for historical and genealogical students." It will be made up of original and selected articles.

The new Copyright Act is printed in the

Publishers' Weekly for March 7. The same number contains a good portrait of that estimable publisher, the late John Wiley.

Dr. Alfred Philippson's report of his journey through Northern and Middle Greece fills No. 149 of the *Zeitschrift* of the Berlin Geographical Society. The accompanying map shows the geology of Middle Greece.

The Fuller Collection in the Free Reference Library in King Street, Manchester, has been catalogued as No. 2 of the Occasional Lists. It was, as will be remembered, got together by the late John Eglington Bailey, and relates both to Dr. Thomas Fuller and to other authors of the name of Fuller.

The third report of the Massachusetts Commissioner on the Custody and Condition of the Public Records of Parishes, Towns, and Counties is a document of universal interest and application. Apart from its main object, it illustrates the ease with which legislation becomes a dead letter, and it has a curious chapter on the functions and remuneration of the town clerk which deserves a place among the details of Bryce's 'American Commonwealth.' Mr. Swan also takes up the question of ink for records, and supplies a chemical analysis of sixty-seven commercial samples that should attract general attention. Finally, he discusses the proper paper for records.

From B. Westermann & Co. comes No. 1 of the first part (English-German) of an 'Encyclopædic English-German and German-English Dictionary,' edited by Prof. Dr. Ed. Muret and (for the second part) Dr. Daniel Sanders. It is "uniform in plan and arrangement with Sachs-Villatte's French-German and German-French Dictionary, giving the pronunciation according to the phonetic system employed in the method of Toussaint-Langenscheidt." Condensation by means of signs, abbreviations, triple columns, and small type is carried very far, but the presswork is clear. For the vocabulary the editor claims unparalleled fulness (in *A* alone 1,671 titles to 1,468 of Murray or 1,312 of the *Century*), but he omits to mention the fact that his scheme admits proper names, *e. g.*, Adams, Ackerman's Hotel, Alabama, Akrokeraunian, Albion, Alemanni, Alexander, etc., etc. He also proclaims his attention to Americanisms, in proof of which we observe under *all* the "Pennsylvania Dutch" usage, "It is all [or *all any more*, as Muret gives it]," meaning that a certain article (as of food for the table) is exhausted. The array of colloquial and idiomatic phrases is very rich. The work deserves the attention of those who aim at a ready understanding of one or other of the two languages, rather than to acquire a literary knowledge.

— More light is thrown upon the respective effects of masculinity and femininity upon the possibility of intellectual attainment by some examinations recently held in England than by a great deal of à-priori discussion. The examinations referred to were held at 142 local centres and at 135 schools, in all parts of the country, and they were taken this year by very nearly ten thousand boys and girls, and by very nearly an equal number of each. The percentage of boys and of girls who passed in the first, second, and third class, respectively, is given in the following table:

	Girls.	Boys.
First class	55	56
Second class	61	42
Third class	76	76

From this it is plain that in the studies of the Third Class the girls are exactly as good as the boys, that in the studies of the First Class they are very nearly as good, and that in the studies of the Second Class they are half as good again. Everybody who is familiar with the theory of probabilities knows that when the numbers dealt with are so large as in this instance, one is absolutely safe in drawing from them the deductions that they seem to lend themselves to. The great superiority of the girls in the Second Class is attributed by the examiners to the fact that in that class particular stress is laid upon foreign languages and upon geography and history. The conclusion to be drawn from these statistics is, then, that in Latin and mathematics the girls and the boys are exactly abreast of each other, and that, in what may be called the humanistic studies, the girls are far superior to the boys. As in England girls are chiefly taught by women and boys by men, the further conclusion may be drawn from these statistics that, unless in the humanistic studies, in which the superiority of the girls may be in part due to superior instruction, there is no difference to be detected between the merits of men and women as teachers. The examiners state that the percentages do not differ markedly this year from other years, although the number examined is much greater than it has ever been before.

—The people of Ohio are to be congratulated on the excellent quality of the first annual report of the third organization of their State Geological Survey, by Prof. Edward Orton. State geologists may well take it as a pattern of clear style. It contains a review of the structure of the State in the light of recent explorations; and here the chief novelty is the announcement that the so-called Cincinnati axis, an ancient uplift of the strata in the Ohio Valley, trends northwest and not northeast, as it has always heretofore been described. Oil and gas in recent years have naturally taken the greatest share of attention, and this report is for the most part concerned with accounts of their formation and exploration. The chapter on the origin and accumulation of petroleum and natural gas presents a broad review of this interesting subject, and makes it most unhappily clear that, at the present rate of consumption, the natural gas cannot last long into the future. The recklessly extravagant use of the gas in factories and even for burning lime, where grosser forms of fuel can be as well employed, is seriously deplored. In Prof. Orton's opinion, the gas should be reserved for domestic use, where its value as a cheap, clean, and convenient fuel is so great. If thus used, its duration might be greatly extended. Other articles by the author on the same subject may be found in the Eighth Annual Report of the United States Geological Survey, and in the Bulletin of the Geological Survey of America. An interesting item concerning the form of leases for oil land, taken from the above report, is of value to Ohio farmers. Instead of following the old custom of leasing entire farms on one-eighth royalty, it is suggested that the leases should be for areas not larger than fifty acres, in which the owner shall retain absolute control of ten acres, where he may drill for himself or lease to other parties. This plan should have been invented and adopted years ago; it would certainly have resulted in a vastly more equitable and healthful distribution of the enormous profits that have accrued from oil production under the ordinary form of leases.

—We can commend the report of Ensign Albert P. Niblack, United States Navy, upon the manners and customs, arts, industries, etc., of the Coast Indians of Southern Alaska and Northern British Columbia, to all who are interested in ethnology, or who, from humanitarian or other motives, may wish to get a good idea of the position which these people have reached in the march of civilization. Summing up, in brief, the results here given, it may be said that, in their social and tribal organization, they do not differ materially from the Indians who lived east of the Mississippi at the date of the discovery. Totemism exists among them, and descent, especially in the more northern tribes, is in the female line. A man's influence depends largely upon his wealth, though this seems to consist not so much in what he has as in what he gives away. Slaves are, or rather were, numerous, and much of the drudgery of life was left to them. Aside from this, the labor necessary to the support of the family was and is equitably divided between the sexes. Women as well as men devote themselves to special pursuits, and the time not employed in procuring food is given to their several occupations. Expert house-carpenters can be found among them, as well as canoe-builders and tanners. Some work in metals, carve in wood, stone, bone, and horn, while others, especially the women, make baskets and weave cloaks and mats of cedar-bark and wool. With the disappearance of the shamans, many of their superstitions are going; and, in spite of the evil effects which contact with the whites at first produces, they are fast adjusting themselves to the new conditions. In a word, considered as a group, they are said to be "capable of almost any rise in the scale of civilization." It is proper to add that Mr. Niblack passed several seasons upon this coast engaged in Government work, and this volume is based upon observations then made and upon the collections in the National Museum. It forms a part of the report of that institution for 1887–'88, and contains 161 pages, 70 plates, 2 charts, and more than 300 illustrations in the text.

—The first number of a new illustrated periodical, *Black and White*, which lately made its appearance in London, contained a bit of literary news that caused a certain ripple of sensation among readers. This was a report that the 'Journal of Marie Bashkirtseff,' which purported to be a transcript from an actual diary taken from an original manuscript, was really a work composed in part by M. André Theuriet, or at any rate very ably edited by him, and changed in the editing. Marie, at various epochs of the story, was set down as being much younger than she really was at the time, and other embellishments were added. Besides this, it was said that M. André Theuriet had never had the whole manuscript of the 'Journal' in his hands, but only certain fragmentary notes, out of which he had produced the book, altering some of them very markedly. This story was published in France, "with all reserves," by the *Temps*, and drew from M. Theuriet the next day a most explicit and formal denial. He says:

"At the request of the family of Marie Bashkirtseff, and in memory of my friend, Bastien-Lepage, and without any other motive, I consented to busy myself with the 'Journal,' with a view to its publication. Heaps of manuscript books were brought to me consisting of the entire text of the 'Journal' since 1873. I read the whole of this manuscript, and, in concert with the family, eliminated from it whatever might prove tedious—repetitions, *enfantillages*, useless descriptions of dress, confidences disagreeable to third persons. After this severe revision the 'Journal' still contained enough matter for

two volumes, which have been published without one addition or one alteration."

M. Theuriet adds a remark which seems true enough, and even obvious, to wit, that a very slight degree of literary discernment is sufficient to enable any one upon the first reading of the book to make himself quite sure that the whole of it is the work of one hand. Nevertheless, it is well that a prompt and complete denial has been given to the false report.

—The longest article in Parts x. and xi. of the 'Handwörterbuch der Staatswissenschaften' is one of seventy-eight pages on "Beer and the Beer-Tax." The editor is moved to apologize for this inordinate allowance by saying that the author of the article exceeded the space allowed him, but that as so thorough an exposition of the subject is nowhere else to be found, it was thought best to print the article unabridged, and the publishers promise to furnish forty-eight pages additional matter in the next number without extra charge. Along with other interesting information, the article in question contains an instructive table of the beer production of various countries of the world, from which it appears that although formerly Great Britain and Ireland took the lead in this industry, there has been a change in the last two years. In 1888–89 Germany was the largest beer-producing country, brewing 48,354,218 hectolitres; Great Britain and Ireland ranked second, with 46,861,584 hectolitres (28,644,000 barrels of ale-measure); the United States ranked third, with 31,460,978 hectolitres (26,820,953 barrels of beer-measure). When we consider the annual consumption of beer per head of population, the order of precedence is changed. Here Belgium, the country which leads the world in intemperance, stands first, consuming 186 litres per capita; Great Britain and Ireland next, 119½ litres; Germany, as a whole, comes third, 101½ litres; but if we have regard to the separate States, Bavaria would lead the world as a beer-drinking country, the average annual consumption of each man, woman, and child reaching 227 litres, while Würtemberg, with its 159 litres per capita, would come immediately after Belgium. After Germany comes Denmark, 95 litres, and then the United States, 57 litres per head. Second in point of length is the article (of sixty-three pages) on theories of population, more than two-thirds of it being devoted to Malthus. First we have an exposition of Malthus's theory; secondly, an account of his predecessors; then an account of his adherents in the first half of the nineteenth century, considered under two heads, *i. e.*, as adherents in theory and adherents in practice; after that his opponents are taken up under three subdivisions. There follows a similar consideration of opinion in the second half of our century; also, a criticism of Malthus in the light of the actual movement of population in various countries from 1871 to 1880. This learned essay is by Dr. Ludwig Elster, Professor of Political Sciences at Breslau, and one of the four editors of the work. Other interesting titles, which we have space only to mention, are Stock Exchanges, Book-Trade, Whiskey Tax, Inland Commerce, Budgets, Book-keeping, Blind Asylums, etc., etc. There is further the usual number of brief biographies, with full bibliographic details, concerning John Bright, Maurice Block, Lujo Brentano, and other contributors, living and dead, to economic science.

THE DE QUINCEY FAMILY.

De Quincey Memorials: Being Letters and other Records here first published, with Communications from Coleridge, the Wordsworths, Hannah More, Prof. Wilson, and others. Edited, with introduction, notes, and narrative, by Alexander H. Japp, LL.D., F.R.S.E. 2 vols. New York: United States Book Co. 1891.

Dr. Japp is the apologist of De Quincey. The particular attack that these new memorials seemed designed to meet is the doubt of De Quincey's veracity in the autobiographic details which he wove into his works. Some question of the Opium-Eater's truthfulness was early expressed, and latterly Mr. George Saintsbury has printed suspicions of the same sort which lost none of their vexatiousness coming from his pen. Mainly in consequence of this critic's remarks, if one may judge from the constant reference to them, Dr. Japp and the representatives of De Quincey have published in these volumes the family correspondence. The exposure of private affairs, nine-tenths of which have no interest whatever to outsiders, is complete. The interior arrangements, both domestic and financial, are laid open, and in the letters of De Quincey's mother, two sisters, and two brothers every one is made welcome to a not very edifying story.

The family was not a happy one. The mother was unable, apparently, to win the affection of the children, and they on their side were impatient of her discipline. Mrs. De Quincey was a woman of much formal propriety, attached to the Clapham sect in religious and moral sympathy. De Quincey himself draws a vivid picture of her as he remembers the impression she made on him in early years:

"Figure to yourself a woman of admirable manners, in fact as much as any person I have ever known distinguished by ladylike tranquillity and repose, and even by self-possession, but also freezing in excess. Austere she was to a degree which fitted her for the lady-president of rebellious nunneries. Rigid in her exactions of duty from those around her, but also firm herself; upright, sternly conscientious, munificent in her charities, pure-minded in so absolute a degree that you would have been tempted to call her 'holy'—she yet could not win hearts by the graciousness of her manner. . . . It is as good as a comedy in my feeling when I call back the characteristic scene which went on every morning of the year. All of us, for some years six, were marched off or carried off to a morning parade in my mother's dressing-room. As the mail-coaches go down daily in London to the inspector of mails, so we rolled out of the nursery at a signal given, and were minutely reviewed in succession. Were the lamps of our equipage clean and bright? Were the springs properly braced? Were the linchpins secured? When this inspection, which was no mere formality, had travelled from the front rank to the rear, when we were pronounced to be in proper trim, or, in the language of the guard, 'all right behind,' we were dismissed, but with two ceremonies that to us were mysterious and allegorical—first, that our hair and faces were sprinkled with lavender water and milk of roses; secondly, that we received a kiss on the forehead."

It is not to a son's credit to write thus of his mother; but the tone shows plainly the absence of any warmth of feeling, a perfect coldness and apathy of filial affection. It is added that Mrs. De Quincey taught her children to undervalue themselves so that, says De Quincey, "we held it a point of filial duty to believe ourselves the very scum and refuse of the universe." And, to add the last anecdote that fills out this unfavorable picture, it is related that a servant, on being asked why she did not appeal to the mistress, replied: "Speak to mistress! would I speak to a ghost?"

Notwithstanding all this, it is plain enough that Mrs. De Quincey was a mother devoted to the welfare of her children. She had the disadvantage of having guardians associated with her, one of whom, Dr. Hall, was certainly a most unfortunate choice. Mrs. Baird Smith, one of De Quincey's daughters, thinks that she was self-distrustful and sought advice from her friends, the Clapham people, and that the children felt this interference of strangers as a bar between them and their mother. Whatever was the reason, the result was that both Thomas and Richard ran away and suffered much hardship, and none of the others exhibit any attachment to the mother. On her side, however, we think none can read her letters without being inpressed by her excellent qualities, and in particular, in later years, by her willingness to assist De Quincey and the rest to the utmost of her means. From the time he went to Oxford her purse was used for him, and after he had wasted his inheritance she gave him continually from her funds as much as was possible, though she insisted, with good sense, on keeping the capital intact and settling it on the grandchildren. She certainly lacked tact in appealing to the children, and she spoke her mind freely about their faults, but not so harshly but that a grown person, making allowance for her religious belief, strongly colored with evangelicalism as it was, should have seen and honored the motives and feelings which prompted such criticism. Here is as unfavorable a passage as can be quoted, written on hearing and too readily believing that the education of De Quincey's daughters was being neglected. She offers to pay the school bills, and then goes on as follows:

"I have long been too certain that you were bringing up your sons in idleness, but hoping they were to be made scholars and their minds taught to work, I supposed they would be kept from falling necessarily into profligacy, and live by literature, but I know not where or what now to hope; and, O my son, if they are all brought up in idle ignorance, what but the worst can be expected? I am sure of this, that a Parent with your means who does this is utterly unworthy of children; but still in the present time where must the wages of this bad work fall the heaviest? In this time, bad as it is in many points, to bring up girls in idle ignorance is only to make them victims, not prepared to take their place among industrious people laboring for bread, yet too ignorant to be received elsewhere!! I cannot express my feelings as I ought; I can only proffer my help; and if you can possibly be angry to hear the truth, I too well remember what you said touching my respect for the lowly virtues to be surprised, though not shaken in my well-assured convictions."

This is an extreme instance of fault-finding, and there is nothing in it that any one can object to, except the readiness to believe that De Quincey was so derelict in his parental duty; and it is allowed that as respects the girls there was some color for the censure. Perhaps another passage is not amiss as representing his mother's tone in his boyhood. She writes to him at the Manchester Grammar School as follows:

"I plainly perceive that you have exalted one, and that the most dangerous faculty of the mind, the imagination, over all the rest; but it will desolate your life and hopes, if it be not restrained and brought under religious government; it may then be turned to the use it was assuredly given for, in the pursuit of any profession, and be nobly used in the service of your Maker. In a worldly sense, without you bring this busy, restless power into submission to reason and judgment, you are undone; you are now carried away, wholly blinded by the bewildering light of your fancy, and that you may never see clearer your reading is all of a sort to weaken your mental optics."

These passages serve for illustration of Mrs. De Quincey's character and temperament, but they really do injustice to her since they do not disclose the continual anxiety she felt for her children, and her serviceableness to them

practically after they grew up. She repelled them by her principles, too narrowly held and too rigidly enforced; she did not win their trust, and appeal to her against what they thought wrong in their school-life appears not merely to have been useless, but to have brought only her strongly expressed displeasure on them as unruly and disobedient. And these errors of conduct cost her their affection. It was a full price to pay, and justice may now be done to her more admirable traits of fidelity, self-sacrifice, and devotion to her parental duty.

Richard was the child who suffered most from the defects in his guardianship. He ran away from school because he was flogged, and, on being returned and flogged for this offence, he ran away a second time, joined a merchant ship as cabin boy, was captured by pirates on the South American coast, escaped and made one of the storming party at Montevideo, and so distinguished himself that he was at once rated a midshipman by the English admiral. He was in the action at Copenhagen, taken prisoner by the Danes, and afterwards exchanged, on which occasion he made himself known to his family. They questioned his identity at first, as he refused to meet them personally, but he afterwards satisfied their doubts, and was in pleasant intercourse with them till he met an early and unknown death in Jamaica on a hunting excursion. He was twice in England during his wanderings and was in want, but he so feared his guardians that he kept himself obscure; nor did he finally disclose himself till he was safely past twenty-one years of age. This persistence of Richard in what must have been a hard and unwelcome life is the strongest proof of the severity and lack of sympathy he felt in his natural friends, and, indeed, his feelings towards his guardians must have amounted to hatred. In his letters he shows a pleasant disposition and the intellectual tastes which characterized the family, and he is altogether the most attractive of them. The letters of the sisters are not of any special interest except as they carry on the family story; and Henry, the last brother, seems to have been rather a weakling.

The literary part of the Memorials is considerable in bulk and separable from the family portion. Its principal feature is the collection of letters from Dorothy Wordsworth to De Quincey. These are admirable, and sufficient in charm and interest to give the volumes permanent value in literature. They describe, in the rapid, natural, and feminine way that belonged to their author's pen, the interior of the Wordsworth household; and as De Quincey was especially interested in the children, they are full of anecdotes and news about the little ones, who were as fond of De Quincey as he of them. Nothing, perhaps, is more childishly delightful than "Johnny's" interpolation into his evening prayer for his "good friends" —"Mr. De Quincey is one of my friends"; but there are several incidents of the sort. There is, of course, much besides the children's affairs—about the De Quincey cottage, then in the furnishing, the Green family lost in the snow, the doings of Coleridge, Wordsworth's verse-writing, Jeffrey's reviews, and especially the Convention of Cintra pamphlet which De Quincey was seeing through the press. Wordsworth was somewhat apprehensive of being prosecuted for this publication, and Dorothy writes:

"William still continues to haunt himself with fancies about Newgate and Dorchester or some other gaol, but as his mind clings to the gloomy, Newgate is his favorite theme. We, however, have no fears; for even if the words be actionable (which I cannot but think they are not), in these times they would not dare to inflict such a punishment."

We should mention also two admirable letters of Wordsworth to De Quincey before meeting him, very characteristic and kind, and a letter of Coleridge to De Quincey when the latter asked repayment of some loans, in which Coleridge appears to advantage in the sincere expression of feelings honorable to him. The correspondence with Prof. Wilson lets more light upon the financial relations of De Quincey with himself, both being borrowers, and exhibits the former's indulgence and friendship under trying circumstances. The correspondence of Lord Altamont abundantly justifies all that De Quincey said of his association with the family, and shows the peer's own character in a pleasant light. Of the other heterogeneous material perhaps nothing needs particular notice except some fragments of Patrick Brontë's poems, not in themselves of any merit.

The net result of this collection is to sustain De Quincey's accuracy of statement, and so far to benefit his reputation. At all points where he is tested by these documents he is found correct. At the same time, the history of the family is so exhibited as to give better opportunities for judging of his position in early life, and of how they discharged their obligations to him after he fell into misfortune. It is perhaps well to have the subject cleared up, though it is not one with which the public has much concern. It does not appear to us that, all things considered, he was illiberally treated. He took his career into his own hands with more or less excuse, but he did not prosper in the undertaking. As soon as he came into his inheritance, he used it, in part generously, but altogether foolishly, and soon it was gone. He wrote a long and minute history of this worldly failure, and in it he discusses his hopes and the reasons of his various decisions. One passage illustrates his estimate of himself:

"I hoped, and have every year hoped with better grounds, that (if I should be blessed with life sufficient), I should accomplish a great revolution in the intellectual condition of the world. That I should, both as one cause and one effect of that revolution, place education upon a new footing throughout all civilized nations, was but one part of this revolution; it was also but a part (though it may seem singly more than enough for a whole) to be the first founder of true philosophy; and it was no more than a part that I hoped to be the reëstablisher in England (with great accessions) of mathematics."

This was apparently written in 1818, in De Quincey's thirty-third year. That he formed such hopes, and retained them so long, shows the lack of judgment with respect to himself and his own life which characterized him. He had already fallen under the opium habit. He excused himself from ordinary labor in the professions on the ground of these great aims, and the fact was that most of what he really accomplished was piecemeal work done for the magazines to get money. His mother had about £13,000, which she determined to hand down to her grandchildren, *i. e.*, De Quincey's children, but she assisted him out of the income; and in this her decision must commend itself to a practical mind. His uncle in India also assisted him at times, but, after his retirement on a reduced allowance of perhaps £700 a year, seems to have found that sum no more than sufficient for his bachelor tastes. It cannot be made out that De Quincey did not receive as much from the family estate as was fairly to be given to him. The reproach that they were indifferent to his welfare and practically deserted him has no foundation in the light of these Memorials. Altogether, the story seems more honorable to his mother than to himself, in substance, though she cannot be wholly freed from responsibility for errors of judgment, and for the cold demeanor in early days which made the youth of the boys so unhappy both in itself and in its results.

ANTIQUATED ENGLISH.

A Select Glossary of English Words used formerly in Senses different from their present. By Richard Chevenix Trench, D.D., Archbishop. Seventh edition. Revised by Rev. A. L. Mayhew, M.A. London: Kegan Paul, Trench & Co. 1890.

A Select Glossary of Bible Words; also, a Glossary of Important Words and Phrases in the Prayer Book. By Rev. A. L. Mayhew, M.A., Chaplain of Wadham College, Oxford. London: Eyre & Spottiswoode. 1890.

It was but seldom that Dr. Trench succeeded in rising above a humble linguistic plane; and he reached, at the highest, only a popular mediocrity in the trifling book now reprinted. Yet, so far as regards England, the book has proved fortunate, owing to circumstances quite apart from its intrinsic worth,—circumstances in default of which the first impression of it would, in all probability, have been also the last. For who can doubt that, at the cost of no more trouble than skilful use of a dictionary like Johnson's or Richardson's, a compilation of the same stamp, and in no wise inferior, could have been executed without difficulty? That it was not forestalled may, therefore, appear singular. Any forestalment of it, at least by other than a writer of some name, must, however, have failed of acceptance; nor would it have fared differently with the present performance, but that its author, by having already discoursed on our language in a way to attract attention, had seemed to give promise of merit in what farther ventures he might undertake as a verbarian. Characterized strictly, it is, in fact, hardly more than a collection of illustrated jottings; of interest, doubtless, to such as, by reason of a beneficial perusal of Dr. Trench's earlier manuals, are preresolved to extract utility from it, but of very slight interest otherwise. To whomever it concerns, it chiefly affords proof that its author had dipped, with his wits about him, into a moderate number of older writers; a revelation of no particular importance, we take it, save to his friends and pupillary admirers. And, in saying thus much, we almost complete an appraisal of it. While offering but a minimum of new facts to even an ordinarily thorough student of English literature, its details, though conned ever so diligently by any one else, are very unlikely to effect a serviceable lodgment in the memory. Its practical value is, accordingly, to be rated as of the smallest.

For a person professing to investigate the history of words, Dr. Trench was, at one time or other, capable of deliverances indicating a strangely imperfect acquaintance with literature, a ludicrous precipitance of judgment, and other equally discrediting singularities. For instance, he could speak of *educational* as having been, between 1830 and 1840, "an offensive, or, to say the best, a very dubious, novelty in the English language"; an oracle, by the by, only half intelligible. As to *starvation*, so astonishing was his heedlessness of historical verity that he stigmatized it as "an Americanism." Again, treating of *topsy-turvy*, 'there is," he asserts, "no doubt of the fact, that it is a corruption of *topside the other way*." And similarly wild conclusions of

his are far from being infrequent. Indeed, considering that he tacitly laid claim to both wide and exact scholarship, the superficialness of his inquiries, his groundless pronouncements, and his headlong conjectures are quite beyond all reasonable expectation.

Of everything of this kind Mr. Mayhew, having profited by the guidance of a host of philological experts, is fully aware. But how can he be justified, as editor, in identifying himself, in the manner he has done, with the author he has reproduced? Think as one may of his free-handling, yet his frankness is commendable. For he tells us: "In the present edition, the 'Select Glossary' has been carefully revised, and a few of the articles have been rewritten." The articles here spoken of as "rewritten" are, to be sure, enclosed in square brackets; but, since additions or insertions obviously editorial, like those under "flirt," "ought," "sad," "trivial," etc., are in no way marked as such, how is one readily to discriminate the teachings of Dr. Trench's reviser from those of Dr. Trench himself? Besides this, where we are offered "rewritten" articles, the articles for which they are substituted are quietly displaced. The heretic Aerius was satisfied with equalizing episcopal authority and presbyteral. But now we have a step forward, and one in keeping with the spirit of a progressive age, in that the former rank of authority is postponed to the latter. Would not Mr. Mayhew do prudently in being more cautious?

"This little volume," says Dr. Trench, "does not propose to note the peculiarities of single writers, but the general course of the language." Yet, in numerous instances, it transgresses this ill-expressed programme. At the same time it often fails to record, where record of them would have been apposite, obsolete senses, once widely current, of words now in vogue. To close these remarks, let us consider, as sufficiently exemplifying the defect here named, the verb *discover*. In Psalm xxix. 9, *discover* denotes "strip," though Dr. Trench defines it by "uncover"; a meaning which, however, it bears in Micah i. 6, etc., unnoticed by him, as likewise are Isaiah xxii. 8, etc., where it signifies "strip off," "remove." *Discover*, as, till very recently, one with "disclose," "reveal," he was warranted in passing by; but that he neglected to mention still another signification of the word, common enough in older authors, betrays, somewhat strikingly, the partial character of his researches. Its equivalence to "explore," "survey," "reconnoitre," "examine," "view," etc., as in the subjoined quotations, is here referred to:

"Sirs, go and ryde forth into the feldes, and *dyscouer* the countre euery way, and loke if ye se any thynge, and come hyder agayne."—Lord Berners, *Froissart* (1523), Vol. I., p. 245 (ed. 1812).

"In lyke maner as knyghtes doe by lande go before the bataylles, to *dyscouer* the countrey and enbusshes." *Ibid.* (1525), Vol. II., p. 357.

"Furbisher, presently takyng vpon him, with his company, fully to *discouer* the same [*i. e.*, the Ilandes Moluccae]," etc. Richarde Willes, *Hist. of Travayle* (1577), fol. 231*r*.

"She laie a slepe upon her backe, with her handes cast over her hedde—as, for the most parte, yong women are wont to do—so that forthwith the yong Prince *discovered* her from toppe to toe." Barnabe Riche, *Farewell to Militarie Profession* (1581), p. 102 (ed. 1846).

"They perceived that, vpon Christmas daye, they had *discouered* along the coast three score and tenne leagues to the Eastward." Nicholas Lichefield, *Lopes de Castanheda's First Booke*, etc. (1582), fol. 10*v*.

"After him came also Sancho de Toar, who went to *discouer* Sofala, and made relation thereof to be a small Iland," etc. *Ibid*, fol. 95*v*.

"To leuie souldiers . . ., and to send them to *discouer* the Ilands of the west." Robert Parke. *Mendoza's Hist. China* (1588), p. 137.

"It is not possible to declare the bredth and length thereof [*i. e.*, of Mexico]; for that vnto this day it is not all *discouered*." *Ibid*, p. 316.

"Crauing libertie of Don Henry to *discouer* the Islands of Cape Verde, which was granted them." Rev. Richard Hakluyt, *Galvano's Discoveries of the World* (1601), p. 73 (ed. 1862).

"The gouernour . . . sent foorth his sonne, John Arias de Auila, . . . to *discouer* also by sea and by land." *Ibid.*, p. 127.

"Iovinus . . . sending out before a diligent scout-watch to *discover* the coasts, made haste," etc. Philemon Holland, *Ammianus Marcellinus* (1609), p. 305.

"He walk'd into the Island with Alcippus, Osmin, and Gartias. One part of it he *discover'd*, and, finding no other Inhabitants there but wilde beasts," etc. William Browne, *Polexander* (1647), Part III., Book IV., p. 125.

"Nor was Don John less active, but, a good while before day, moved from Namure, sending before . . . to *discover* the wood-land country, and possesse himself of advantageous places." Sir Robert Stapylton, *Strada* (1650), Books VIII.–IX., p. 50.

"I went out into the island, with my gun, to . . . *discover* the country." De Foe, *Robinson Crusoe* (1719), Vol. I., p. 84 (ed. 1840).

"God commanded Moses to send twelve Men to *discover* the Land of Canaan." Rev. Jeremy Collier, *Essays*, Part IV. (1722), p. 146 (ed. 1725).

"Having, therefore, in this manner rather *discovered* than subdued the southern parts of the island, Cæsar returned into Gaul, with his forces." Goldsmith, *History of England* (1771), Vol. I., p. 11.

"We set out from Peru for the river Maranham, to *discover* and settle there." Southey, *Expedition of Orsua* (1821), p. 129.

Of no less frequent occurrence than the *discover* seen in these passages were, for a long while, *discoverer*, *discovery*, and *undiscovered*, for "explorer," "exploration," and "unexplored."

Of Mr. Mayhew's 'Select Glossary' there have been several kindred precursors, meritorious in different degrees, the most noticeable among them being Dr. Aldis Wright's 'Bible Word-book.' Still, as possessing features of its own, it is by no means superfluous. Clearness, brevity, and critical scholarship distinguish it throughout. The extent to which the Bible revisers of 1611 injudiciously thought fit, by copying from their forerunners, to entail on after-ages the perplexity attaching to archaic phraseology, is distinctly brought out in its pages; and its bringing this out constitutes its leading differentia.

THREE NOVELS.

Dr. LeBaron and His Daughters: A Story of the Old Colony. By Jane G. Austin. Boston: Houghton, Mifflin & Co.

Martha Corey: A Tale of the Salem Witchcraft. By Constance Goddard DuBois. Chicago: A. C. McClurg & Co.

Walford. By Ellen Olney Kirk. Boston: Houghton, Mifflin & Co.

MRS. AUSTIN has evidently met with the fate that often overtakes the too eager seeker after buried literary treasure. In her last unearthing of Old Colony chronicles she has called up a multitude of spirits which she has not had the power to marshal into order. The story of 'Dr. LeBaron and his Daughters' will doubtless be interesting to the comparatively small number to whom the book is dedicated—"the kith and kin of the name and lineage of LeBaron"; but it is lacking in the qualities necessary to maintain the interest of the general reader. The figures crowd upon and jostle one another, appearing and disappearing in a rapidly shifting panorama, and presenting confusing genealogical complications that are a weariness to the spirit of any but the most untiring of local antiquarians. The Doctor himself stands out with a certain distinctness, due, however, to the man's inherent qualities rather than to the literary ability of the author. Faults of style abound, unpardonable in an author of Mrs. Austin's experience; besides grammatical inaccuracies, there are passages that irresistibly provoke a smile where no humor was intended, while the humor is often clumsy when it is not trivial. For example, we read:

"But in 1775, the First Church, still orthodox in name and tenets, assembled itself beneath its hundred-foot-high spire with a gilded weather-cock on top, and, muffled in great-coats, cloaks, shawls, and furs, for no sybarite had as yet suggested fires in a meeting-house, prepared itself to listen with a divided mind to Parson Robbins's eloquence."

The occasional strong passages give evidence that, with more care in the selection and use of material, we might have had a clear page of living history instead of this blurred, confused picture, the manifest work of a careless, unsteady hand.

By no means lacking in vigor is the romance of 'Martha Corey,' one of the victims of the Salem witchcraft delusion. The tale begins in the mother country, where live the actors with whom the fatal thread of Martha Corey's life is interwoven. The daughter of an impecunious Earl, whose hand has been promised to the son of a wealthy London wine merchant, to cancel a heavy money obligation; the hero himself, a youth who has early discovered the hollowness of the world; the typical villain, nephew of the Earl and madly in love with his cousin; his female accomplice, "born with an obliquity of moral perception," ward of the wine merchant and in love with the son—these plot and counterplot, weaving the thread of destiny that is to entangle innocent people on the other side of the Atlantic. There is some novelty in the daughter of an Earl going alone to a new country and achieving local distinction as cook in a public inn, but the impetuous action of the story very naturally takes her there and, at length, into the friendly shelter of Martha Corey's household just as the first cloud of the witchcraft tempest, no bigger than a man's hand, is seen on the horizon. Martha Corey, joyous, independent, and walking by inner light, is a character against whom the spirit of the times in which she lived would naturally be opposed. It would seem, however, as if the Rev. Mr. Parris had already enough to answer for in the terrible results arising from his religious fanaticism, the flame of which was fed, so history hints, by personal malice; but in this story he is dyed a still deeper black by being made the purloiner of the private papers of a chance travelling companion merely to obtain temporary power over a stranger. The author has evidently the best of intentions, for as far as possible she liberally rewards the virtuous and punishes the guilty; but in dealing with hard facts of history one is obliged to resign the happy position of holder of the scales of justice. The style is somewhat amateurish, but vigor of plot and fertility of incident save it from being commonplace.

An involuntary recognition of kinship with the men and women portrayed in a character-study is instant testimony to the presence of the glow and warmth of life. Without this radiating power such a study is a more or less ingenious piece of mechanism. It would hardly be fair, perhaps, to pronounce 'Walford' a mechanical piece of work, yet through all its movement there is always a suspicion of outward rather than inward impetus. In spite of superabundant activity, the figure of one of

the heroines (there are two sisters) fails to give us a sense of vitality. Beautiful, and with a decided philanthropic bias, which ample means allow her to follow, she has many admirers of both sexes who tell us of her ardent desire to ameliorate suffering in every form; but although we are present at her ministrations, we are not stirred by so much as a throb of responsive sympathy. Perhaps the author dimly felt this and allowed her to fall into the vulgarism of a quasi-engagement to the odious mill superintendent in order to give her a touch of nature. The sister awakens sympathy and interest because of the sudden and mysterious loss of her only child; but the reader's painful sense of her having married the wrong man is not mitigated by the clumsy manner in which he is disposed of to make room, after a decorous period, for the friend of her girlhood. The plot, though well worn, does good service by the introduction of fresh incident, but the literary substance of strikes has been already hammered into such thinness that it will hardly bear working over without the addition of new material.

The Development of Africa. By Arthur Silva White. London: George Philip & Son. 1890. 1 vol., 8vo.

Mr. White has treated what is properly a scientific subject in a strictly scientific manner, and has put together in logical sequence and connection all that is accurately known of the Continent of Africa. The work is so full of facts, and contains so great a mass of details, that anything like an exhaustive notice of it within reasonable limits would be impossible. With all its conciseness, however, the book is very interesting, and after the wearisome petty details in which most travellers indulge, it is refreshing to find that the gold has at last been separated from the mighty mass of sand. In the author's own language, his plan has been to build up Africa under the eyes of the reader, and to give complete pictures of the continent by dealing successively with the various aspects under which it is known in Europe. An admirable series of maps by Mr. E. G. Ravenstein accompanies the volume. Each map is a well-repaying study, and brings vividly to mind the familiar lines of Horace—

"Segnius irritant animos demissa per aurem
Quam quæ sunt oculis subjecta fidelibus."

Mr. White gives us at first a bird's-eye view of the continent, embracing its geology and characteristic features and illustrated by three maps. The geology we may omit as not particularly interesting; the physical characters are briefly as follows. Dry land occupies the greater portion of the continental plateau, while the shore line is almost without indentations. From the surrounding seas the continent rises terrace upon terrace, and the neighboring island of Madagascar, formerly part of the continent, exhibits the same structure. A narrow coast line from 100 to 300 miles in breadth, and not more than about 600 feet in elevation, encircles the greater part of the continent, the mean altitude of which is about 2,000 feet. Kenia, Kilima-njaro, and Ruwenzori are the highest mountains, each reaching a height of about 19,000 feet. The great drainage areas are the Atlantic, the Mediterranean, and the Indian Ocean. The inland drainage areas are the Sahara, the Kalahari Desert, and Eastern Abyssinia, of which the first is by far the most extensive. The political settlement of Africa has coincided with the ocean drainage areas, as the inland areas are practically uninhabited. Where the great rivers break through the plateaus their beds are filled with rocks, and navigation is consequently obstructed at short distances from their mouths.

Mr. White devotes his second chapter to the African lakes, rivers, and mountains, in great but very interesting detail. We have next a chapter on climate and cognate phenomena, including the fauna and flora of the continent. From this we extract what will perhaps be of general interest—the account of the great desert of Sahara, which is not, as commonly supposed, a level expanse of sand:

"The true desert is where, in this vast plateau, the dunes lie heaped up and murmur like the waves of the sea; where animal life, if it exist at all, assumes the protective color of the sand; where there are no birds, no trees, no flowers; 'the sky without clouds, the sands without shadow'; 'the region of blind forces of heat and wind.' Only about one-ninth of the Sahara is covered with sand; the remainder consists of mountains and rocks, steppes and oases. In the high-lying districts the valleys are covered with trees and are fairly habitable; and in the Arabian desert to the east a luxuriant vegetation exists in the river valleys. . . . This is what the Sahara is not unlike in fine weather, but when a sand-storm occurs, or when the suffocating hot winds blow, then it is a region unfit for man or beast."

A chapter on the indigenous population follows. Mr. Ravenstein, after a very careful calculation, estimates the population of Africa at only 127,038,370, and gives an interesting and valuable table of the areas and populations of the different European possessions. The six indigenous races are the Semites, Hamites, and Fulahs, with curly hair; negroes and Bantu, with woolly or fleecy hair; and Hottentots, with woolly hair growing in tufts. To these we must add the Malayo-Polynesian family in Madagascar. The geographical distribution of each race is given, and is quite accurately known. The whole chapter is full of interest, and amounts almost to a treatise.

Chapter v. is devoted to Islam and Christianity. Our author sums up the advance of the two religions very pithily: "Islam or Arab influence advances with the sword in one hand and the Koran in the other, as it appears to us. Christianity or European influence advances with the sword or paper treaties in one hand, and the Bible or a case of gin in the other, as it appears to the native mind. It is no use quarrelling with the comparison; it is a just and faithful one." The greater part of northern Africa is and has for more than 1,200 years been Mohammedan. Christianity has begun at the southern extremity of the continent, mainly at least, and is gradually advancing towards the equator, where, perhaps, the two religions are destined to come in contact for the final struggle. Of course there are isolated Christian communities north of the equator and similar Mohammedan communities to the south. The opinions of travellers as to the influence of Mohammedanism in elevating the negro are divided. The weight of evidence appears to us to be in favor of a decided influence for good. Mr. White states the case very impartially, but seems to lean rather towards the views of Lenz and those who regard Islam as decidedly injurious to mental growth.

The much-vexed subject of the traffic in slaves forms another monograph, not, perhaps, adding much to our knowledge, but emphasizing the frightful details. Our author suggests the establishment of firm bases at different points on the coast connected by chains of settlements across the continent; and an organized system of native police under European officers, with gunboats on the great lakes, which are intersected almost at right angles by the eastern slave routes. Of course, joint action of all the European Powers would be necessary, but the climate and the heavy expense would be serious obstacles.

An excellent historical sketch of the progress of African exploration and discovery follows. It is too detailed to permit of special notice in this place, but forms a most convenient work of reference. The subject of the commercial resources of the Continent is next in order, and naturally is discussed at much length. The ivory question alone is one of great importance, since ivory is almost the sole cause of the slave trade. Considering the enormous loss of human life which the traffic entails, it is surprising to find that the value of the annual export of ivory, according to Westendarp, is only seven or eight millions of pounds sterling. It is estimated that about 65,000 elephants are killed annually. The animals are forsaking the coasts for the interior, and will probably be extinct in another century or two. An idea of the ruin produced by the liquor traffic may be obtained from the fact that from 1883 to the end of 1887 more than 30,000,000 gallons of spirits were imported into Africa. An earnest effort was made at the Berlin Conference in 1885 to put a stop to the importation, but it was thwarted by interested parties. All European Powers take part in the trade.

A survey of European domination forms the subject of another chapter, and this is followed by one on the kindred subject of political partition. The author shows how the Continent is being divided into "protectorates" and "spheres of influence"—diplomatic euphuisms for wholesale robberies. The present political status is best shown by the excellent map. The general result is, that south of the equator the whole continent has been divided among European Powers, but north of the equator the boundaries are nearly all unsettled. Pagan Africa is now European, while Mohammedan Africa is Arab. Mr. White concludes his work with an excellent general summary of the principles underlying the development of Africa along natural lines. We heartily recommend the book as thoroughly readable, and as a conscientious and painstaking compilation of facts which to thoughtful minds are full of interest, even if often painful and seldom inspiring well-grounded hopes for the future.

Cardinal Newman. By Richard H. Hutton. Houghton, Mifflin & Co. 1890.

Without the express avowal that this book was undergoing its last revision in the proofs when Cardinal Newman died, the author's name would have saved it from a suspicion that it is one of those books hastily constructed to economize the interest in a distinguished person immediately following his death. We had had an earnest of its quality in Mr. Hutton's essay upon Newman, which was republished with others in this country a few years ago. Indeed, this volume, written, it appears, as one of a series of "Religious Leaders," is hardly more than an expansion of that essay. Of biographical detail it has the merest thread, only enough on which to string a series of criticisms of Newman's writings in the order of their publication. No finer critical faculty could have been brought to the interpretation of Newman's strange experience, and there is no such painful contrast of the style of subject and biographer as there must generally be when Newman is the theme. Mr. Hutton's habitual style is good enough to spare the haunting echoes of Martineau's that are sometimes here—a tribute to the early teacher whose teachings he is anxious to forget. That now and then his hand is subdued to what it works in is only what we should expect, and there are passages

almost as Newmanish as Newman's own, while everywhere there is a choice of words and a felicity of phrase that are perfection in their kind.

A peculiar interest attaches to Mr. Hutton's book because of the nature of his own religious experience and the ardent, while still imperfect, sympathy that he brings to Newman's progress from the Church of England to the Church of Rome. The son of a Unitarian clergyman, and in his youth a protégé and pupil of Martineau, he had a progress or regression of his own quite as extensive as that of Newman, which should qualify him to appreciate the changes Newman underwent. But his sympathy is much more positive than could arise from such a source. It is the sympathy of one who has gone far on Newman's way from Anglicanism to Rome; so far, that we find ourselves wondering why he did not go farther, and whether, even now, it is too late for him to go the remainder of the way. The remainder is much less than the distance Newman traversed, after the condemnation of Tract 90 in 1841, to his submission to Rome in 1845. There is some adverse criticism of Newman and a good deal of Rome, but of sympathy and approval there is much more, with sometimes, apparently, the irritation of a man who maintains himself in a position of unstable equilibrium by a painful effort of the will. If we are not greatly mistaken, the reader will often forget the sufferings of Newman, now fifty years remote, in his sympathy with those of the victim who is still stretched upon the rack of theological uncertainty.

No part of Mr. Hutton's book was less required than the argument for Newman's genuineness and greatness with which the opening chapter is taken up. The argument is based on the singleness and steadfastness with which he devoted himself to a noble aim, and on the consecration of a literary talent of the highest order to the original purpose of his life. In the course of the argument Mr. Hutton takes Mr. Huxley to task with some asperity for his suggestion that a Primer of Infidelity could easily be made from two or three of Newman's works. Mr. Hutton is so much troubled by this suggestion and the coördinate belief of many that Newman was fundamentally skeptical, and only believed because he was resolved to do so, that he returns to the matter in his fifth chapter, which is given up to it entirely. Mr. Hutton utterly rejects such a construction, and he makes out at least a plausible showing for the view that it was not his own but others' difficulties which he was endeavoring to overcome. So much seems to be undoubtedly true so far as natural religion was concerned, but that so many have derived a contrary impression of his belief in revealed religi n and the Church cannot, we think, be quite unwarranted. In Mr. Hutton's contention with Huxley in chapter v., the utterly unscientific character of his own thinking gives a naïve absurdity to some of his remarks. That we have not exaggerated Mr. Hutton's approximation to the Cardinal's position is evident from the terms in which that position is disclaimed. He "cannot adopt for himself his [Newman's] later conception of the Church of Christ, *hardly even* that earlier conception *which led so inevitably to the latter*." The italics are ours.

In Newman's first considerable work, 'Arians of the Fourth Century,' there was a "full expression of his confidence that dogma is the backbone of religion." Mr. Hutton gently insinuates that he made too much of dogma, or, at least, that he did not sufficiently distinguish between the intellectual conceptions implied in Revelation and the life and character which it reveals. Here and elsewhere we have something of that fluffiness which we owe to the influence of Maurice upon Mr. Hutton's mind, an admirable device for those who would fain avoid clear thinking and believe some things and not believe them at the same time. He finds the style of 'The Arians' dry almost to grittiness, and contends that Newman's greatness of style was largely a development of his Roman Catholic period. This, however, if true at all, is only true of his major works, not of his sermons. Mr. Hutton would have us believe that it is equally true of his sermons; but his quotations are convincing that he goes too far.

The chapter on "Hurrell Froude and the Mediterranean Voyage" gives a more agreeable impression of Froude than we get from Newman's 'History of His Opinions.' It is very interesting that it was Froude, the more Roman of the two in advance, who came back to England less impressed by what he had seen in Italy, and better satisfied with the Church at home—this, in part, because he was more an English Tory than he was anything else. Mr. Hutton finds much of Froude's thought in Newman's language in the 'Lyra Apostolica,' written upon the voyage, and remarks the fact that the various scenes had no suggestions of pagan art, or poetry, or history for Newman's mind. Off Ithaca he wrote a poem "On the Death of Moses," and off Zante one on the Greek Fathers, and so on. Newman's poems are rated highly, Mr. Hutton saying of the poem comparing the Jewish race to Œdipus that Æschylus would have been proud to have written it if he had lived again in our time, while the "Dream of Gerontius," which Newman dropped into his waste-basket after he had written it, he cannot praise enough.

In the chapter "Newman at St. Mary's," subject and critic are at their best, for it brings out that ethical and spiritual quality of Newman's mind which transcends all theological and ecclesiastical differences, and comes home to all men who are in temptation or in sin. Nevertheless, it was a St. Mary's sermon, on the wisdom of the serpent and the harmlessness of the dove, on which Kingsley founded his charge of Newman's indifference to truth, whence came the 'Apologia' in reply. Mr. Hutton's defence brings out the dangerous side of Newman's teaching. Coming to "Advancing Estrangements" and Tract 90, Mr. Hutton flatly contradicts Newman's assertion that Mr. Oakeley was the head of the new Oxford school that pushed the founders of the movement from their seats. It was, he says, George William Ward, and there are no more entertaining pages in his book than those describing this troublesome spirit. It is a serious charge that Newman gave out as history "facts which had not gone through the form of taking place," because he had been alienated from Ward. It was the pestering of Ward and others possessed by a conviction of the anti-Roman character of the articles, that compelled Newman to write Tract 90, the least characteristic of his writings, in Mr. Hutton's opinion, giving "a very false impression of his mind and genius." "It was very far, indeed, from an insincere document," but it "took refuge behind the ambiguities of a creed artfully devised to suit the views of two very distinct parties whose drift was at bottom wholly irreconcilable."

Newman's experience was very tragical in the years between Tract 90 and his submission to Rome, to whom through all this time he was theoretically drawn, while practically repelled; held by personal ties, and alienated by an illogical position. 'The Development of Christian Doctrine' was written while he was already a Romanist in his heart. Mr. Hutton describes it as "full of devout subtlety," and criticises it more elaborately than any other writing, and less satisfactorily. Sometimes, however, he strikes home, as in reply to Newman's making the partial and local degeneracy of the Church, without prejudice to the authority of the Bishop of Rome, a "note" of its divinity. Here Mr. Hutton compares him to the German monk who argued "that no church not divinely sustained could survive such corruptions."

Only 60 pages out of 251 in Mr. Hutton's book are given to Newman's Roman Catholic years, though they were almost exactly half of the whole eighty-nine. The astonishing sermons on "The Glories of Mary" read as if Newman had resolved to outdo his new companions in the grossness of his superstition. The "Lectures on Anglican Difficulties" were heard by Mr. Hutton when they were first delivered, and he gives an eloquent description of their effect upon his own mind. Into his criticism of Newman's subsequent writings we cannot follow him. It is always interesting and suggestive, if it is nothing more. One sentence hits the white as, perhaps, no other in the book: "Whatever he thought that he 'ought' to believe, he has always found the means, not only to believe, but to interpret to himself with a unique vivacity and intensity of conception." All too briefly Mr. Hutton sketches Newman's relation to the decree of Papal infallibility. In a private letter to his bishop he called those who favored it in England "an aggressive, insolent faction," though personally it had for him no difficulties whatever. But when Pius IX. was succeeded by Leo XIII. in 1878, Newman's "minimizing" view of the Vatican decree came to the front and he was made a Cardinal in token of the change.

Power through Repose. By Annie Payson Call. Boston: Roberts Bros. 1891. 12mo, pp. 169.

AMERICANS who have been abroad are always struck on their return to their native land by the over-expressiveness of their countrymen's faces, both while talking and in would-be repose. The brow and eyes are contracted, the mouth screwed up or down or to one side; an expression of subdued agony or anxiety, or else a smile so intense as to squeeze all further possibilities out of the countenance. In short, a species of contortionism, of which the aggregate effect is very strong and unexpected, makes our whole nation look odd and off its balance, until we get once more accustomed to the phenomenon. Nowhere in this country do we get the cod-fish eye, the slab-like cheek, the tranquil voice, which give to the population of England so massive a look of reserved power.

Miss Call is a lady who, having been struck by the abnormality in us of this constant tension of so many muscles not in use, has taken the matter to heart and studied it in all its ramifications, and who, after much practical experience, gives a sketch in this charming little volume of the ways in which we may train ourselves out of the vicious habit, and depicts the wide-spreading benefits which thereupon accrue. The evil does not affect merely the face: all the muscles of the body take part in the habitual over-contraction; so that, having learned first to contract our muscles in order to do things, we must again voluntarily study how to relax those which

are not needed for the end in view. And not only when working or acting, according to Miss Call, but when sitting, when lying down, when thinking, even when sleeping, is there in most of us an inveterate inward tension which we never let go and which makes complete repose an impossibility.

This signifies much more than a material waste of tissue which adds itself to the total wear and tear of the day, for its remoter reflex effects may, in certain temperaments, be formidable and widespread. A perfectly calm and placid tone of mind is out of the question with a system that is never completely relaxed, but always quivering with residual and incipient contractions. Such a person never rests with his whole weight on his chair. His feet still press the ground, half ready to rise, his fingers convulsively clutch the chair's arms or work at each other. On the pillow the neck muscles still are rigid. A certain inward breathlessness, vague expectancy, dispersion of the attention, and worry are the inevitable results of such muscular habits as these. We are all sinners. If the reader's attention has never been called to the matter before, he will be little less than astounded to find how twisted up his muscles are. Let him relax each contracted point as he notices it, and he will find layer after layer of new contractions appearing, which were masked until the stronger ones gave way. Only after a long series of muscles have been "let go" is complete sedateness attained; and the perfect calm of it is then likely to seem a new experience of bliss.

Miss Call's merit is to have taken this important truth *au grand sérieux*, and to have worked at it with a zeal which some might almost deem fanatical. According to her, there is hardly anything which systematic training in relaxation will not accomplish for certain persons. It will regenerate their nervous strength, their temper, their ability to attend, their speech, their powers of effective work in every direction, and of course their cheerfulness, their gait, and grace of presence. It is probable that Miss Call's claims are in no wise overstated for a certain class of persons. The sedative effect of habitual relaxation does "make them over again." What the *rationale* of these remote effects may be is another matter. Probably Miss Call takes too simple a view of it when she ascribes it all to physiological rest. It is something more psychological than that. Take this case:

"A lady who suffered very much from having her feelings hurt came to me for advice. I told her whenever anything was said to wound her at once to *imagine her legs heavy*—that relaxed her muscles, freed her nerves, and relieved the tension caused by her sensitive feelings. The cure seemed to her wonderful" (p. 68). Again, "when you begin to *worry*, think your legs heavy. Your friends will appreciate the relief more than you do, and will gain as you gain" (p. 71).

It seems clear enough that in cases like this the relaxing of the leg muscles is only a means of redistributing the attention and changing the whole emotional tone and attitude.

We regret to have no space for other extracts which might sound less eccentric than these. The book is short, and written with a beautiful simplicity and sincerity. It combines unusual knowledge of human nature with unusual depth of sympathy with human needs. It should become widely known; and a philanthropist with some surplus income might do a much worse thing than to distribute it widely among the teachers of the land.

NEW VOLUME OF CHAMPLIN'S YOUNG FOLKS' CYCLOPÆDIA.

Vol. III. GAMES AND SPORTS. By JOHN D. CHAMPLIN, Jr., and ARTHUR E. BOSTWICK. Illustrated. $2.50.

A compendium of all kinds of games, athletic sports, simple chemical and mechanical amusements.

The Nation.

NEW YORK, THURSDAY, MARCH 26, 1891.

The Week.

THE *Tribune's* announcement that "the public will be especially interested to find that the President expresses himself unreservedly against renewal of the agitation on the tariff or the silver question," has naturally produced a profound sensation. "Especially interested," indeed! Why, the public are thunderstruck. Extensive preparations have been made for this agitation. A large number of the leading newspapers are committed to its continuance. Clubs have been founded for that purpose, and considerable amounts invested in houses for their accommodation and in the production of documents for popular circulation. There is, too, behind these preparations a great deal of dissatisfaction with the McKinley Bill and alarm of one sort or another about the prospect of free coinage. There is also a widely diffused belief—perhaps a mistaken one, but none the less a fact—that the President is the people's servant; that it is for him to listen, for them to speak; that "agitation" is simply the popular name for discussion among his masters as to what he shall be directed to do or refrain from doing, and that one great use of agitation is to clear his mind as well as that of Congress on public questions. His prohibition of any more discussion on these subjects for the present is therefore a terrible blow to those who do not agree with him. Of course they were aware that they did not know as much about such questions as he does; that the cogitations on political economy and finance carried on in that Indianapolis law-office raised his intelligence far above that of the mass of his fellow-citizens; but they always thought that, although he might despise their prattle, he would let them prattle on. We shall still hope that this deliverance of his is not final. Delegations will, we are sure, shortly leave this city for Washington to remonstrate, respectfully, of course, with our ruler on the impolicy, demonstrated by centuries of human experience, of closing the public mouth in periods of great disturbance. Great minds, especially great Indiana minds, reach their conclusions *per saltum*, as it were, but ordinary people elsewhere have to chatter to each other a good deal before they can be sure they are right.

We wonder whether the President has ever read with comprehension section 25 of the McKinley Bill, which allows a drawback on the imported raw materials used in articles manufactured for export. That he has read it is apparent, for he told the correspondent of the *Tribune* in that immortal interview that

> "Under this act the American merchant can get raw material, for the duty is not charged where such material is imported to be manufactured into articles for exportation, and so the American merchant will be able to sell at the same point of advantage as the English merchant, with the additional advantage of free entry into ports where treaties are made."

But has he read it with comprehension? We fear not, for it runs thus:

> "That the imported materials used in the manufacture or production of articles entitled to drawback of customs duties when exported shall, in all cases where drawback of duties paid on such materials is claimed, *be identified, the quantity of such materials used and the amount of duties paid thereon shall be ascertained, the facts of the manufacture or production* of such articles in the United States and their exportation therefrom shall be determined, and the drawback due thereon shall be paid to the manufacturer, producer, or exporter, to the agent of either, or to the person to whom such manufacturer, producer, exporter, or agent shall in writing order such drawback paid, under such regulations as the Secretary of the Treasury shall prescribe."

We are quite sure, if he had understood it and had talked to any manufacturer about it, he would have found out that no American would attempt to compete with British manufacturers in a product in which the free raw material would have to appear and be "identified" so that it could be weighed or measured by custom-house officers, with the risk of disallowance, of appeal to the courts, of endless affidavits, of charges of perjury, and of delays and annoyances of all kinds. Fancy, for instance, using a proportion of foreign wool in the carpet manufacture, and having to point out the particular threads of foreign origin, and swear to them, before he got his drawback. The venerable men who drafted this section, we suspect, knew well what they were about, but it is plain they did not let the President into their secret.

We are looking with much interest for the responses which Republicans of the land, in and out of the press, may make to the *Tribune's* second-term Harrison proclamation. Thus far, not only are there next to no favorable notices, but scarcely any notice whatever is to be found in the leading journals of the party. This is the more remarkable when we consider that the President has appointed something like twenty leading editors of the country to lucrative and honorable public office. With the creditable exception of the *Tribune*, not a single one of the journals whose editors have been so favored has had a word to say in approval of the second-term boom. This extraordinary silence ought to be explained by some one who understands it, which we are free to confess we do not, and we call upon the *Tribune* to enlighten us, and to rebuke its fellow-beneficiaries for their ungrateful conduct. Absolutely the only favorable notice that we have been able to discover after several days' examination of the newspaper mails, is one from a poor little paper in Poughkeepsie whose editor has only recently been made Postmaster. His gratitude has not yet had time to cool, and yet he is only able to say that he thinks time will convince everybody that the President is really and truly a great, big man and not "under-sized and insignificant," as his political enemies have represented. Here is the striking portion of the Postmaster's tribute: "It is altogether too early yet to talk of the nomination for 1892, and we do not speak of him as a probable or possible candidate then. But the people are recognizing his sterling worth, his greatness of mind, and his sound statesmanship, and we believe this feeling will increase greatly during the remainder of his term."

The Republican newspapers are naturally hugely delighted with Mr. Phelps's article on Blaine's diplomacy, and think that it makes a very good joke on the Mugwumps, which it undoubtedly does. We cannot recall any joke on anybody in politics quite so good of its kind. Mr. Phelps was about the last man from whom either Mugwumps or Democrats looked for an article defending Blaine's diplomacy, not on legal grounds, but on any grounds that came to hand. A teacher of law to young men at Yale College, too, was one of the last men from whom they looked for ridicule of arbitration, and commendation of war, as a means of settling international differences. And he was among the last Democrats by whom Mugwumps, who had opposed Blaine in 1884, and assisted to defeat him because they believed him personally dishonest, expected to be called on to certify to a foreign nation in 1889 that they believed him to be just and truthful in all his dealings, and an honorable and worthy and competent exponent of his country's rights in the forum of international diplomacy. The joke is the more enjoyable, too, because Mr. Phelps's article is the first defence of Mr. Blaine's diplomacy which has appeared anywhere. The journalistic endorsements of it as "superb," "overwhelming," and so forth, which have been put forth by the party organs, do not count. These organs have never pretended to have any knowledge or even opinion of their own about the Bering Sea question, and no Republican lawyer of standing or character has ventured to come to their aid. But they must not laugh too long, or crow too loudly, for they are already, in their glee, on the edge of an approval of Mr. Bayard's diplomacy as able and patriotic and shrewd, which, considering how they spoke of it when Mr. Blaine came in, would be very mortifying, if they did it inadvertently. They must therefore pull up short, and not make too much of Mr. Phelps. He is a dangerous man to handle, as he stands just now. He is by no means a "dead wire."

Senator Allison and ex-Representative Cannon have completed their statement of the appropriations made by the last Congress. The total for the two sessions foots up $988,000,000, but this does not include the direct-tax refund, amounting to upwards of $15,-

000,000. If this is added, as it should be, to the other extravagances of the Fifty-first Congress, the sum reaches more than a thousand million dollars for two years, being an increase of $170,000,000 over the appropriations of the last Congress. The greater part of this increase is due to pension largesses by which modest and honest veterans have been tempted to join the greedy and the unscrupulous in a general rush on the Treasury, and to barter their fame for money. The increase in pension appropriations for the two years is $113,000,000, but this does not measure the real increase, since the examination of claims under the Dependent Pension Bill has only begun. Under this bill, as Gen. Alger triumphantly explained to the Grand Army men, it makes no difference whether the claimant is rich or poor. If he is unable to earn a living by manual labor, he has a good claim, and it rests largely with himself to decide whether he is able to do so or not.

The Italian Consul at New Orleans, Signor Corte, has made a statement about his countrymen in that city which we trust will receive due attention from the members of the late lynching party, because it opens up a really fruitful field of reform. He speaks with great justice of the enormous service rendered to the State by the large number of sober, hard-working, and, on the whole, well-behaved Italian laborers employed on the sugar and cotton plantations around New Orleans.

"But," he adds, "this does not exclude the fact that there are among them about a hundred criminals, escaped from Italian prisons, most of them long since naturalized as Americans, mixed up in the city and State politics, and caressed and protected by politicians, through whose support several have obtained important political places. Their especial occupation was to naturalize newly-arrived Italians here."

The truth is, we believe, that the Louisiana State law allows immigrants to vote at State elections as soon as they have declared their intention to become citizens of the United States, or, in other words, it may be the day after they land, and there is a rush of politicians on board every emigrant vessel to secure votes as soon as she gets to the wharf. A more shocking state of things it would be difficult to imagine, and how the "good Americans" who broke open the jail the other day in order to get at the products of this iniquity, can have allowed it to exist all these years, it is difficult to comprehend. But it shows clearly that they are not the symmetrical, all-round reformers that the crisis calls for. Somebody in Boston has proposed, as a remedy for the evils of profuse immigration and reckless naturalization, the establishment of a "Professor of America" in every college, whose duty, we suppose, would be to brag about his country to his class. But this is not what is needed. Every man, or nearly every man, can do his own bragging, both about himself and his country. What is wanted is a Professor of the Sins, Negligences, and Ignorances of "good Americans," and among them the patience and good nature with which they submit to the rule of the "ignorant foreigner," and, indeed, the cheerfulness with which they accept it, if they think it will put them in the way of an office, however petty, or make a reduction in their taxes, or even relieve them of a little "bother." It is quite safe to say that there is not, in most of the States at least, a single evil or abuse usually attributed to immigration which is not due in the last analysis to native indifference, connivance, or cowardice.

The New Orleans jury is now undergoing the most thorough investigation. They all say they were not bribed, and the blame of the local press seems to fall mainly on Seligman, the foreman, who fled to Cincinnati on the day of the massacre. It appears that an affidavit touching Seligman's unfitness was sent to the District Attorney before the trial, and the District Attorney now says in an interview that when he received this affidavit the jury was already empanelled; that had it reached him sooner he would have excluded Seligman—an excuse which the *Daily Picayune* treats as flimsy. It says Seligman controlled the jury absolutely through his superior intelligence. The probabilities are, however, that if the jurymen shared, as they doubtless did share, the popular opinion about the Mafia, they acquitted the prisoners from sheer terror. No juryman will stand up against the fear of assassination. The reasonable assurance that his death will, if he falls, be terribly avenged, does not under such circumstances console either the ordinary man or his family. This is the experience of all nations and races. He wants to live and carry on business at the old stand, and thinks murderers ought to be pursued and punished, as the California Sheriff said, "by the darned fellows they murder."

We learn from the *American Manufacturer and Iron World* of Pittsburgh that the plate-glass manufacturers have called the attention of the Treasury Department to the fact that they are about to open 390 new works or pots, and that there are not enough skilled laborers in the country to operate them. What the Treasury Department is going to do about it is not stated. Perhaps it will be asked to issue an order for 1,500 first-rate glass-workers and assign them to the Diamond Plate Glass Company, the Charleroi Plate Glass Company, the Ford City Glass Company, etc., etc. The Treasury Department has been charged with the duty of executing the Alien Contract Labor Law, not of violating it or winking at its violation. We cannot see any reason why these highly protected manufacturers should apply to the Treasury Department for foreign laborers, any more than why buyers of plate glass should apply to the same department for a remission of the duties, which amount to 141 per cent. ad valorem on the larger sizes of plate. The plate-glass business is combined in the form of a Trust, or something very closely resembling it, and the profits of the business are such that those who carry it on ought to be able to take care of themselves without any more help from the Government than they are already receiving.

The *Financial Chronicle* calls attention to the fact that the country is now shipping gold abroad where it would be shipping silver but for the senseless law, passed last year, increasing the Government's purchases of the latter metal to 4,500,000 ounces per month. This result was pointed out by the *Evening Post* at the time when the new Silver Act was passed. It is a mathematical formula that if we produce 54,000,000 ounces of silver per year and export one-half of it, we can retain an equal amount, say $27,000,000, of gold or of other things at gold value. But if the Government buys and locks up the whole amount, we must send abroad $27,000,000 more than we otherwise should of gold or other equivalent goods. In order to avoid sending gold, we must put down the price of the other goods in order to induce foreigners to take them instead of the gold. In short, the Silver Bill of last year is a bill to depress the prices of all exportable commodities except the precious metals. The deluded farmers and planters who urged the passage of that bill are now paying the cost of it in lower prices for wheat and cotton.

The opinion seems to be held in some influential quarters that the action of the Treasury Department in refusing to furnish gold bars for export will cause more gold to be exported than would otherwise be taken at this time. The implication is, that some people's nerves will be so affected that they will jump into the gold-exporting business regardless of expense, and send out the yellow metal even though the rate of exchange would not reimburse them. We can see not the slightest evidence of such a tendency. The truth is that the United States is the only country, we believe, that has ever put upon its statute-book a provision authorizing its Treasury officers to pay out something better than its own standard coin. Our act of May 26, 1882, went further than that: it not only authorized but required this. The authorization still continues. The Treasury can give bars for coin if it chooses to do so. It can charge something for the exchange if it chooses to do so. The object of the law originally was to take away from exporters any motive for "picking and choosing" among the various gold coins coming into their hands—selecting those of full weight or a trifle over weight to send abroad, and leaving the lighter ones at home. This was the *raison d'être* of the law, and it had no other. In this view it was a wise provision, but the exercise of the discretion conferred by it must be left to the Department. There is no reason to suppose that it has been erroneously exercised in the present instance.

A very interesting struggle is in progress in Boston, growing out of the efforts of Gov. Russell to expel "politics" from the police administration of the city. In 1886 the Republican managers of the party in the State had a law passed by the Legislature which transferred the control of Boston's police force from the Mayor of the city to the Governor of the State. The object was to enable the Republicans to convert the police into a party machine which would increase their strength in a Democratic stronghold, and this object has been pursued without concealment for the past four years. The police, and through them the liquor-dealers, gamblers, and criminal classes, have been drawn to the support of the Republican party in Boston through the instinct of self-preservation. The result has been that while the Democratic strength in the city has been cut down, the lawless elements of the population have grown in audacity, and the enforcement of the laws against them has become more and more lax. Gov. Russell is trying to mend matters by removing a police commissioner who is chiefly responsible for the demoralization of the force by means of political uses of it, and appointing a Republican of high character in his place. It is said that the Republicans of the Governor's Council are determined to oppose him in this by refusing to approve the new appointment, and by upholding the present commissioner.

The Newfoundland trouble is entering on a more acute phase nearly every week. A resolution signed by all members of both houses of the Legislature has been transmitted to the Colonial Office, protesting in the strongest terms against the threat of coercion contained in the bill now before Parliament giving the Crown fresh power to enforce the treaty with France. The Ministry is evidently in a condition of great perplexity over the matter. France has a hold on them which she will not relinquish, through fear of weakening her position in Egypt; and the only excuse which can be made for coercing Newfoundland for her benefit is the one Lord Salisbury makes, viz., that in case of war with France, England would have to defend Newfoundland. But the Newfoundlanders would plainly sooner have their shores to themselves than have England's guarantee. The affair would be capable of a money settlement were it not for the Egyptian complication. It ought to and probably will give a death-blow to the "Imperial Federation" scheme, for it will bring home to all the colonies the embarrassments which might overtake them were they to become responsible for the maintenance of the British Empire as it now is.

The English are laboring in a somewhat helpless way with a very melancholy judicial complication. Sir James Stephen is one of the Justices of the Queen's Bench Division of the High Court of Justice, better known, perhaps, to an earlier generation as Fitzjames Stephen, the author of 'Liberty, Equality, and Fraternity,' and of various essays on law, politics, and morals, in which the views of the Positivist school were set forth with a vigor that sometimes bordered on the humorous. But he has also achieved much fame in legal circles as the author of a code for India, of a Digest of the Law of Evidence, a Digest of the Criminal Law, and a History of the Criminal Law of England. Moreover, he was for the usual term of five years the Legal Member of the Governor-General's Council in India—a place once filled by Macaulay and more recently by Sir Henry Maine. He has filled his present place on the bench since 1879, and, in spite of a somewhat dogmatic manner and an over-readiness to take part in current political discussion, has filled it admirably. Recently a growing infirmity of temper and grave fits of forgetfulness on the bench have alarmed the bar and the suitors in his court, and have led to strong pressure on him to resign, which, however, he has resented and resisted. An application in the House of Commons to the Government to take up his case has been refused by Mr. Smith, on the very good ground that any readiness on the part of the Ministry of the day to procure a judge's removal might be construed as, or might some day degenerate into, an attack on the independence of the judiciary; and he intimated that the moving of the address to the Crown which was necessary in such cases, ought to come from a private member, so as to deprive it of all party color. No private member has as yet shown signs of any inclination for the task, as, of course, all the Judge's friends desire, if possible, to avoid removal by procuring his voluntary resignation. The latest news is, that the Lord Chief Justice has induced him to refrain from sitting in court pending a thorough medical examination of his condition.

The affair has brought out a good deal of comment on the numerous cases in which English judges, high and low, continue to discharge their duties with faculties impaired by great age, to the very serious injury of litigants. At present there appears to be no machinery for dealing with such cases. There is not, as in Continental countries, any Minister of Justice charged with a general supervision of the courts and responsible for the character and competency of the judges; so that old judges, like old ministers of the Established Church, sometimes hold on to their places after hearing and sight and memory and judgment have all become impaired. Our rule of compulsory retirement at seventy, in fact, seems to be looming up as a probable solution of the difficulty; but the English will never copy our system of turning old judges out in the world without any provision for their decent maintenance. No judge in England will be forced to retire without a good pension, so that his latter official years will not be disturbed, nor his independence menaced, by pecuniary cares.

The condition of rural France has some resemblance to that of rural New England. The *Économiste Français* gives a digest of a number of recent documents relating to the condition of the agricultural laborer there. Wages of farm hands have quadrupled during the present century, and the greatest increase has been in the lowest form of labor. The man-of-all-work who was paid only 96 francs per year in addition to his board in 1834, now gets 400 francs, while the shepherd, "the aristocrat of the farm," who received then 360 francs and board, now gets only 600. His wages have not doubled, while those of the humbler workman have more than quadrupled. The increase of wages of farm hands is ascribed in part to the demand for labor in factories and on railroads, and in part to the military service, which takes young men from the farms at the period when their habits are forming, and gives them a taste of town life from which they are never wholly weaned. When their term of service expires, they begin to look for situations in the towns and to worry the public men to find places for them. These drafts upon the rural population, tending to lessen the number of farm laborers, raise the wages of those who remain. The result is smaller profits to the farmer and a sort of agricultural crisis. Still another fact in the matter of rural depopulation is noticed, namely, a diminution in the number of children. Several cantons are named in which there has been a marked decrease of population since 1868. In two of these the ascertained reason for a diminution of the number of births was "the desire of the parents to improve their own condition," and it is added that this effect has followed. Here we find real Malthusianism in practice.

In consequence of the scarcity of French rural labor, Italians come over the southern border and Belgians over the northern to work for stated periods and then go back to their homes. In Corsica the Italians come in squads of six to ten, each under a leader, whom they call the Corporal, who is generally the best workman, and whom they pay something extra for his services as Corporal. Their wages are usually 450 francs per year, out of which they pay their own expenses (board 160 francs, travelling 35 francs, Corporal's fees 15 francs), so that they are able to carry back at the end of the year's work 240 francs ($48), which is considered by them good pay. In the north of France, Belgian laborers flock over the border from the middle of July to the first of September in great numbers. They are described as sober, frugal, seldom seen in the wine-shops, and lodging on the farms where they work. In one small commune of 150 inhabitants in the Department of the Nord 10,000 francs in wages was paid to transient Belgian laborers in one harvest, because French laborers could not be obtained.

MR. PHELPS ON MR. BLAINE.

A VERY singular article is contributed to the April *Harper's* by Mr. E. J. Phelps, our late Minister to England, on "The Bering Sea Controversy." To appreciate its singularity fully, one must know that the Bering Sea controversy, *quâ* controversy, was closed in 1888 by the agreement between Secretary Bayard and Lord Salisbury, to which Russia was a party, making provision for a close time in Bering Sea, and for the hindrance of seal-killing in the interval. In making that agreement, of course, Lord Salisbury admitted the interest and value of seal life and the importance of preventing the extermination of the breed. When Mr. Phelps last had official cognizance of the matter, the execution of this agreement awaited, as appeared by the correspondence, two things, the consent and approval of Canada—the real party in interest on the British side—and the passage of an act of Parliament conferring on the Government the necessary powers. Our chargé in London, Mr. Phelps being absent, was so satisfied that all was settled that he kept going to the British Foreign Office asking, "Has Canada been heard from?" Canada had not been heard from when Mr. Phelps went out of office, and the reason was that the Canadians contested the facts of the American case touching the effect on the number of seals of seal-killing in the open sea, and insisted on the taking of further evidence. This caused very unfortunate delay. But the delay left only two questions for further discussion, namely, the right of Canada to interfere in the negotiations, and the accuracy of American figures. These were the points, and the only ones, left for Mr. Blaine, or Mr. Phelps, or any one else to consider when the Cleveland Administration went out of office. There was some excuse for Canadian doubt in the fact that both in 1887 and 1888 Mr. Tingle, the American agent, had reported the seals as rapidly increasing in spite of the poachers, and there was other testimony of a similar character forthcoming.

The delay was very regrettable. It is not necessary for our present purpose to say whether it was excusable or not. But Mr. Blaine, becoming impatient under it, took the law into his own hands by authorizing or permitting American cruisers to seize British ships in the open sea, and carry them into port as lawful prizes. This raised the new question, Have the United States jurisdiction of the sea known as Bering Sea, so as to make it a *mare clausum?* In answer to this, Mr. Blaine wrote to Sir Julian Pauncefote (January 22, 1890) "that it is not necessary to argue the question of the extent and nature of the sovereignty of this Government over the waters of Bering Sea; it is not necessary to explain, certainly not to define, the powers and privileges ceded by his Imperial Majesty the Emperor of Russia in the treaty by which the Alaskan territory was ceded to the United States." "The weighty considerations growing out of that transfer might," he said, "be safely left out of view," while he justified "the action complained of by her Majesty's Government." That meant, of course, that a complete justification was to be found elsewhere for the seizure of British ships on the high seas by American cruisers. What was it?

It was that the killing of seals in the open sea was a "pursuit that was in itself *contra bonos mores*" (January 22, 1890). Now, this argument startled lawyers and publicists all over the world. *Contra bonos mores* is a term of municipal, not of international law. Nations have between themselves no rule of right and wrong which is not the result of general formal agreement or acquiescence. No one has the power to set up moral standards of conduct for the others. No one was able to do this even with regard to the slave trade. When Mr. Blaine announced, therefore, that killing seals in the open sea was a violation of international obligation which might be resisted by force, diplomatists rubbed their eyes. Why seals more than whales? they said. Because seals are interesting and useful, answered Mr. Blaine. But the same thing is true of whales. A leading naturalist* has pronounced whales "in many respects the most interesting and wonderful of all creatures." But seals are warm-blooded mammals, says Mr. Blaine. So are whales. But seals may be easily exterminated, if killed too freely. So may whales. They supplied oil for the scholar's lamp for centuries, and would probably have disappeared wholly from all the accessible seas before now, but for the invention of illuminating-gas and the discovery of petroleum. But who ever thought of putting whales under the protection of international "boni mores"?

Now, here is a point at which we should have said Mr. Phelps's intervention in the controversy would be most useful. He is a lawyer and a lecturer on law, and has spent four years in the diplomatic service. He ought to have something illuminating to say on this very novel proposition of Mr. Blaine's. We accordingly turned to the article in *Harper's* with much curiosity. What he says is this: that the game laws of all civilized nations forbid the destruction of wild animals (not noxious) during the period of gestation, and particularly the laws of Great Britain; that seals are very interesting and valuable wild animals; that "the repression [of their slaughter when heavy with young] ought not to be the subject of a moment's debate between Christian nations"; and that besides this they are "a large and valuable property." Not one word has he offered, or apparently has to offer, on the question whether there is an international game law; whether there is a rule of international law, known as *boni mores;* and whether under such rule each nation has the right to capture and condemn as pirates foreign vessels engaged in sealfishing on the high seas. He intimates, or hints, that there ought to be such a rule, but he does not affirm that there is one; and he has previously admitted that the British Government, when the question was first raised, entirely concurred in the arguments brought forward on our side in favor of protection for the seals by mutual agreement between England and America (*H. M.*, p. 767.)

The most remarkable feature in the property argument is, however, Mr. Phelps's proposition that "this colony of seals, making their home on American soil, and unable to exist without a home on some soil, belong to the owners of the soil and are part of their property, and do not lose this quality by passing from one part of the territory to another in a regular and periodical migration necessary to their life, even though in making it they pass temporarily through water that is more than three miles from land" (*H. M.*, p. 769). It is difficult to decide whether this should be treated as law or natural history. In either view it is as novel as it is erroneous. It would, if good law, make it criminal to kill any migratory bird—wild ducks, wild geese, swallows, robins, or a host of others—away from their breeding-place, or salmon or shad away from their spawning-ground, and in fact would fill the world with somewhat absurd claims and more absurd quarrels. Moreover, neither Mr. Phelps nor any one else knows where the colony of seals go when they leave the Aleutian Islands. This is still a mystery.

Six months later (June 30, 1890) Mr. Blaine abandoned or dropped the *contra bonos mores* argument, and took his stand on the rights and privileges over Bering Sea transferred by the Russian Government to that of the United States when it sold Alaska. These rights, he said, included the right to prohibit the approach of foreign vessels within one hundred miles of the shores of Bering Sea. Mr. Blaine's contention is, that the issue of a ukase in 1821 containing this prohibition proves that the Czar had the right to issue it, and that when the United States and Great Britain protested against all claims on the part of Russia to exercise any jurisdiction over the high seas or any part of "the Southern Ocean," they did not mean Bering Sea, because in various contemporaneous maps the body of water now known as Bering Sea appears as such, and not as the "Pacific" or "Southern Ocean," and is spoken of as such by various contemporaneous writers. The futility, or one might say the childishness, of this was easily pointed out by Lord Salisbury, for if the distinction had any value, it would show that the Bay of Biscay was no part of the Atlantic Ocean, and the Gulf of Lyons no part of the Mediterranean. The leading geographer of Europe has recently testified that it was a chimera of Mr. Blaine's. Moreover, Russia is not on record as having ever attempted to put the ukase in force against any foreign vessels, so that there never was any occasion to contest her claim in detail or before any legal tribunal.

England denies Mr. Blaine's interpretation of her protest against Russian claims. That America ever admitted this particular one, Mr. Blaine extracts from a despatch of the elder Adams by a feat of forced implication. No special mention of the claim to jurisdic-

*Prof. Flower.

tion over Bering Sea has been made by any contemporary writer. Mr. Fish, writing in 1875 on the Canadian fishery question, showed he had never heard of it. No American Secretary since 1825 has ever even alluded to it.

But if the claim were well founded, its inevitable consequence in the forum of international law was to make Bering Sea a *mare clausum*. No sea has ever been forbidden to foreign vessels for one hundred miles from the shore except a sea acknowledged by all concerned to be a *mare clausum*. But, says Mr. Blaine—again (June 20, 1890)—"It did not, as so many claim, declare the Bering Sea to be a *mare clausum*. It did declare the waters, to the extent of 100 miles from the shores, were reserved for the subjects of the Russian Empire." Now, is it possible for any Power to do this? Is there such a thing known to the law of nations as a *mare semi-clausum*—that is, a sea which can be cut up into compartments outside the three-mile limit, and some reserved for the jurisdiction of municipal law, and others left to international law?

We looked to Mr. Phelps's article with much interest for an answer to this question, which the whole cast of Mr. Blaine's mind and the nature of his training make it impossible for him to give. One has only to count the adjectives in his despatches to see the unfitness of his mental constitution for the work of diplomacy. What does Mr. Phelps tell us? Simply that Mr. Blaine has "presented the argument on this point with great ability, fulness, and clearness, and there seems to be nothing left to be added in either particular"! This contribution to the discussion strikingly resembles those already made by our learned contemporary, the *Tribune*.

The really important portion of Mr. Phelps's article is the concluding part, where he reproves American writers for criticising or opposing Mr. Blaine's views in this controversy, where he ridicules arbitration as a mode of settling this and, indeed, it would seem, any international difference, and advises Mr. Blaine to use force in Bering Sea without further delay against what he considers depredations on American property. We presume the article was written before Lord Salisbury and Mr. Blaine had agreed on arbitration as the sensible, rational, and humane course. The lives of men slain in the smallest war between England and America being, *pace* Mr. Phelps, far more valuable than those of all the seals that ever migrated or gestated, it is hardly necessary to discuss this point further. But all Mr. Phelps's friends on both sides of the water will be sorry to see a man of his standing counselling violence as a desirable substitute, under any circumstances, for a possible resort to an impartial tribunal administering, under the rules of right reason, established international usage.

His dislike for arbitration clearly influences, if it does not shape, his view as to the function of the press during international controversies. It is natural that one who believes in war as a not undesirable mode of settling international quarrels, should look on all previous discussion as in some degree preparation for war, and expect the national press during a diplomatic discussion to occupy itself simply in inflaming popular passions in support of a bellicose issue. But the better portion of the press in all civilized countries has long refused to play this rôle. Mr. Phelps is mistaken in supposing the English press plays it. The best newspapers denounced Lord Salisbury's diplomacy in dealing with Russia in 1878 as warmly as it now supports it. Journalists who respect themselves, no longer cry ditto to every extravagance and monstrosity which ambitious politicians momentarily in power produce to tickle the ears of the groundlings.

The following declaration of Mr. Phelps, also touching the share of the public in these controversies, needs much limitation, qualification, and explanation:

> "A nation divided against itself can never achieve a diplomatic success. A Government that is not backed up by the unanimous sentiment of its people, but is opposed in its dealings with foreign nations by a large share of the best intelligence of its own country, if not in the ends it seeks, at least in all the means it takes to obtain them, will never be a formidable figure in diplomacy, especially when its force is found to expend itself in argument rather than in action."

The saying that all party differences should cease at the ocean's edge is only a half truth. Even when war has been declared by our Congress, it is debatable therein when the war should cease, and may be a proper party issue. Treaties are now open to popular discussion in countries where they are not binding till ratified by Parliament or Senate, or executed by Congress. When, in our own history, has a subject like the Bering Sea dispute been withdrawn from newspaper or Congressional debate? We wish no "formidable figure" in our diplomacy that cannot bear the keen sunlight of publicity and fair discussion. What are all the fur seals present and to come in Bering Sea worth to our country and its taxpayers? What are the taxpayers willing to expend or imperil for those fur seals? Those are questions for voters, for Congress, for the law to decide, and not solely for our agents, whether diplomatic or executive. What is going on in the British House of Commons today over the diplomacy of Lord Salisbury and Lord Knutsford over Newfoundland?

SUMMER BOARDING AND RURAL HEALTH.

THE possibilities of the summer-boarder industry are coming to be more fully realized by New Englanders every year. Considering his reputation for shrewdness, the Yankee has been unusually slow to recognize the importance of this crop, and it is still difficult to convince the people in the "back districts" that there are literally "millions in it" to any State which will cultivate it with care. A few far-seeing men are gradually getting their neighbors' eyes open, prominent among them being Mr. Oramandal Smith, Secretary of State in Maine, and Mr. N. J. Bachelder, Commissioner of Agriculture and Immigration in New Hampshire. A few years ago Mr. Smith brought together a mass of valuable matter, showing the great importance which this industry had already attained in the Pine-Tree State, and urging the people to redouble their efforts to attract the tide of summer travel in that direction. Mr. Bachelder has recently sent out from his office a very creditable pamphlet, which contains many really excellent views of the lakes with which New Hampshire abounds, and gives a long list of places where summer boarders are taken, with names and rates, arranged alphabetically by towns.

The railroad companies, which have hardly shown their usual enterprise in this matter, are also waking up, and two or three of the chief lines leading to the lakes and the mountains of northern New England—like the Boston and Maine and the Central Vermont—are spending considerable sums this year in collecting and publishing the detailed information needed by the general public, while they also announce lower rates of fare than heretofore. These efforts are now especially directed towards "opening up" Vermont, which has never had a tithe of the summer visitors to which its remarkable charms of natural beauty entitle it. But the Green Mountain folk have themselves chiefly to blame for this, for they have done little to advertise the attractions of their State. Even now that the transportation companies offer their aid, the farmers are slow to respond. "The Boston and Maine Railroad," says the St. Johnsbury *Caledonian*, "has twice sent an agent over the Passumpsic and Lake roads to obtain full lists of hotels and boarding-houses, with number of rooms, rates per day and week, etc. Yet we are informed that the responses to these inquiries have not given as complete information as could be desired."

The financial gain to the farmer from the advent of the summer boarder is obvious to everybody. But there are other advantages to the rural community that follow in his train which are not so apt to be thought of. One is the marked improvement in the sanitary condition of a State which is sure to be brought about if a large number of its villages are visited by outsiders during the summer. This phase of the subject is discussed in an interesting manner by the New Hampshire State Board of Health in its recent annual report.

This Board has now been in existence nine years, and the report opens with an expression of justifiable pride in the progress which has been made during this period. It says that there is probably not a town in the State but is in a better sanitary condition than it was five years ago, and that in many rural towns the continuance of undesirable conditions is owing to the lack of funds rather than to a total ignorance of their bearing upon life and health. "Towns that for generations gave no thought to hygiene have been aroused from their inactivity to intelligent and systematic action, and the results are to be witnessed on every hand. Typhoid fever has almost vanished from some towns that formerly had an annual outbreak of the

disease. Scarlet fever has been greatly lessened by isolation and disinfection, and diphtheria by the same means is rendered less fearful to any community that will avail itself of these safeguards. No progressive town to-day thinks of neglecting sanitary matters, or of ignoring an outbreak of infectious or contagious diseases, as was formerly the practice."

While due credit for the improvement is given to the many efficient and active local boards of health, and to the better information of the average citizen in regard to the sanitary necessities of his town and the importance of sanitation to private and public interests, it is pointed out that "private interests are the greater stimulus to sanitary action, as evidenced by the work accomplished in manufacturing communities and in towns frequented by summer boarders." The report says that tens of thousands of summer visitors come into the State annually in search of recreation and health, and that "a majority of these visitors are of the most intelligent classes, and are, as they should be, ever watchful for agreeable and healthful surroundings. They demand that the conditions shall be such that the danger of incurring disease therefrom shall be reduced to the minimum."

The Board maintains that "it is the duty of the State to protect, as far as it is able, the health of the thousands who visit this 'Switzerland of America' each year." After speaking of the incalculable benefit to the State of the money which they leave, the report takes this broad view of the various ways in which the commonwealth profits: "The summer traveller has made valuable many a valley and hillside that without his patronage would not be worth the taxes now paid upon the property; supports schools and churches; builds better highways; beautifies and vivifies many a town that but for him would be moss-grown and silent; constructs and maintains railroad lines; exerts a moral and educational influence; contributes to the culture and intelligence of many localities; increases property valuation; and in innumerable other ways adds to the welfare and prosperity of the State."

In return the State incurs certain obligations to the summer visitor, first among which is his protection against diseases arising from sanitary neglect or oversight. It is encouraging to learn that the Board finds the proprietors of hotels and boarding-houses, as a rule, alive to the importance of good sanitation and the pecuniary benefit accruing therefrom. "It is not a difficult matter to secure the needed improvement," says the report, "when it is known that a single case of diphtheria, typhoid fever, or other zymotic disease means an immediate loss of business; and as a rule the summer-resort property-owners pay close attention to the sanitary needs of their respective places."

Every careful observer knows that there is a large measure of fallacy in the traditional belief about the necessary healthfulness of country life. It should be healthy, and it is under proper conditions; but in many a community zymotic diseases prevail year after year simply because of the ignorance or carelessness of the people regarding fundamental rules of hygiene. Perhaps the most beneficent work of the summer boarder is to convince the farming population that a large proportion of the disease among them is unnecessary, and that it must be abolished or visitors will not come.

REFORM IN PRUSSIAN TAXATION.

On the 20th of November last, the new Prussian Finance Minister, Dr. Miquel, explained to the House of Deputies the reform of taxation which, in the name of the Government, he had proposed. Its aim is so to change the direct or personal taxes that their weight upon each taxpayer may be more nearly than heretofore in proportion to his ability to bear it. Questions of increased revenue do not come into consideration. The Minister emphasized that fact, and with reason. The recent denial that Dr. Miquel is about to take Caprivi's place as Chancellor of the Empire does not deny that the Doctor aspires to the Chancellorship; and since he is a "parliamentary" statesman, whose skill lies rather in coming to terms with opposition than in conquering it, each favorable vote is one more stepping-stone to the office whose recent not-parliamentary occupant commonly forced majorities to come to terms with him. To Dr. Miquel, therefore, a proposition to reform taxation and a proposition to increase revenue are, just at present, two quite separate things. Nevertheless, while the existing Prussian tax system can doubtless be improved without increasing its productiveness, any genuine tax reform must recognize, among other things, the necessity of increasing the public revenue.

The division of taxes among the different taxing powers in Germany is quite similar to that which has taken place in the United States. Import duties are as completely forbidden to Prussia as to Pennsylvania, and the Empire has laid hands on the most important objects of indirect internal taxation—on salt, sugar, tobacco, liquor, and beer. The principal sources of Prussia's revenue are, therefore, domains, forests and mines, fees of the courts, bridge, road, and harbor tolls; earnings of the State railways; taxes on real estate, on trades and industries, on incomes, and on inheritances. The pending reform concerns only the last three taxes, and in judging it one must therefore bear in mind that the proposed taxes constitute only part of the tax system. If they seem to fall heaviest upon the rich, it must be remembered that duties on bread and clothing, and taxes on salt, sugar, and beer, fall heaviest upon the poor.

The existing tax on trades and industries (*Gewerbesteuer*) is based substantially on the law of May 30, 1820. Taxable are trade and manufacturing, inn-keeping, handicraft in case the master-workman employs several assistants. An industry situated in a large town is taxed more heavily than one situated in a small town, on the antiquated assumption that only a large place can support a large industry; and the matter is further complicated by the division of industries in large places, and also of industries in small places, into three grades with different tax-rates according to the extent of the industry. The inequality of a tax assessed on modern industries according to hard-and-fast rules that were made before the invention of railways, may be imagined. Large industries pay, as a rule, less than 1 per cent. of their profits, while on the contrary the handicrafts frequently pay more than 2 per cent. The proposed reform exempts from the tax all industries—about one-third of the whole number—which neither employ 3,000 marks capital nor have profits of 1,500 marks yearly, but subjects inn-keeping, a large portion of which would go free under the exemption, to a new special tax. The larger industries are divided into four classes, the highest class having at least a capital of one million marks or a yearly profit of 50,000 marks. For this class the tax is 1 per cent. of the profits. The three lower classes are taxed at slightly less rates, and the tax is assessed partly on the profits and partly on the capital.

Under the present system of income taxation, all natural persons enjoying incomes of 900 marks or more are taxed. Historically and formally the tax is divided into two parts, a class-tax (*Klassensteuer*) on incomes between 900 and 3,000 marks, and an income tax proper on incomes above 3,000 marks. Practically the two parts form one tax. The new, unified tax will be levied on legal as well as on natural persons, and, like the existing tax, on no income less than 900 marks. Like the existing tax, again, the new is to be a digressive income tax, *i. e.*, all incomes larger than a fixed amount (to be 10,000 marks) are to be taxed at a uniform rate (3 per cent.), while smaller incomes are taxed at a continually diminishing rate, falling, in case of an income of 900 marks, to 0.62 per cent.

Incomes will be divided, as at present, into grades, but the new graduation will be much closer. For instance, there are now fourteen grades of income between 3,000 and 20,000 marks, and there will be twenty-six grades. Incomes will not be taxed upon exact figures, but only as belonging to some one grade; and the tax will be computed upon the middle, and not, as heretofore, upon the lowest figure of the grade. Thus, all incomes falling in Grade twenty-six (9,500 to 10,500 marks) are taxed 3 per cent. on 10,000 marks.

In addition to this attempt to render the tax more equal by making the income grades smaller, the reform proposes, as a much more effective measure of justice, an extended application of the principle, already recognized in Prussian tax legislation, that the condition of the taxpayer shall be considered in assessing his income. The most important of the provisions looking to this end allows, in the case of incomes less than 3,000 marks, a deduction of 50 marks from the assessment on account of each child under fourteen years of age. Other considerations which may operate to reduce assessment are an obligation (actually fulfilled) to support relatives who

have no property and contribute nothing to the taxpayer's income; prolonged sickness; accident. These considerations may effect, in case of an income below 3,000 marks, at most a reduction of three grades; from an income between 3,000 and 6,000 marks, at most of two grades. From incomes above 6,000 marks no reduction is made. The greatest reduction of tax, therefore, that can take place from any combination of these three causes is from 54 to 36 marks for an income of full 3,000 marks, and from 165 to 135 marks for an income of full 6,000 marks.

The proposition to extend the income tax to legal persons, *i. e.*, to stock companies, whose shareholders already pay an income tax on the dividends, has met just opposition as double taxation. This objection the Minister seeks to meet, first, by freeing from the tax 3 per cent. of each company's earnings; and, second, by the rather droll assertion that because the cities are permitted to tax such income twice, the State might as well tax it twice also.

The first change to be made in the existing law regarding assessments is, that each person enjoying an income of 3,000 marks or over is expected to declare the amount upon which he is taxable. Assessment by declaration has not lacked critics. Mill considered it "unequal in one of the worst ways," the tax "falling heaviest on the most conscientious." This objection is manifestly conditioned by the state of public morals among the taxpayers. Minister Miquel believes that, in respect of tax-dodging at least, the Prussians are conscientious. In introducing the declaration clause he said: "I have full faith that the Prussian citizen, when required on his honor to tell the truth to the State, as a rule will tell the truth." Nevertheless, Dr. Miquel does not propose to walk by faith alone. While he believes that a personal appeal to individual citizens will, in many instances, stimulate the dormant sense of civic duty, he provides also a more tangible stimulus. The declaration will not be obligatory, but the taxpayer who neglects to make it loses the right of complaint in case he is over-assessed. Any taxpayer who "consciously makes an incorrect or incomplete return which may lead to the diminution of his tax, or in any way conceals taxable income," is finable from four to ten times the whole amount of which he has defrauded or attempted to defraud the State, but in no case less than 100 marks.

But of course local assessors who are not independent enough to assess as well as they know how at present cannot be expected to follow a new and stricter system. The second change to be made in the present law regarding assessment provides, therefore, that while a majority of each new board of assessment shall be elected, as heretofore, from the district, a minority shall be permanent trained assessors appointed from Berlin. Exactly where these trained assessors are to come from is not very clear. Probably they must get their official training in office; but that is exactly what the elected assessors are obliged to do, and as the appointed assessors will be independent of local influence, and will make assessment their business, they bid fair to become the more efficient part of the Board. Nevertheless, it is doubtful whether they will be able to accomplish all that is expected of them. Dr. Miquel's proposition, in so far as it deals with declarations and appointed assessors, is closely modelled on a law adopted in Saxony in 1878. In the opinion of the Saxon assessors, assessment is much more equal than under the old law. It is difficult to reconcile their opinion with the facts. The following table shows, in millions of marks, the amount of income from the principal sources as assessed in Saxony in 1883 and in 1878:

	Land.	Interest and Rent.	Trade and Industry	Salaries and Wages.
1883.....	233	135	378	450
1878.....	214	109	357	334
Increase.....	19	26	21	116

Income from salaries and wages is notoriously easy to assess, and consequently suffers injustice under any system of assessment. A reform, therefore, which increases such income 37 per cent., whereas income from interest and rent is increased 24 per cent. and income from trade and industry, in one of the chief manufacturing sections of Germany, but 6 per cent., does not deserve untempered admiration. The proposed means for checking incorrect and fraudulent income returns in Prussia are apparently in no way superior to those provided by the Saxon law, and, save upon the assumption that Prussians are more honest than Saxons, there is no reason to expect a closer approximation to justice.

The third of the taxes which Minister Miquel seeks to reform is that on inheritances. Prussia has already a tax on bequests to distant relatives and unrelated persons, but, as in most other States of Germany, bequests to near relatives are free. The reform proposition provides that legacies of more than 1,000 marks (excluding from the estimate clothing, house furniture, etc.) shall be taxed 1 per cent. in case the legatee is husband or wife, and one-half per cent. in case the legatee is a lineal descendant of the testator. This tax has two purposes in view—first, to furnish a means of checking income assessments, and, second, to tax funded income higher than personal or professional income. It is, perhaps, the most clearly justifiable part of the whole reform proposition. Curiously enough, it has roused more opposition than any other part, and its failure in the House of Deputies seems assured.

A question naturally and frequently asked is: What will be the financial result of the new system? According to the estimate, the income from the *Gewerbesteuer* will not be altered; the tax on inheritances, if adopted, will bring in three and a-half or four million marks more than the present tax; and the income tax, improved assessment being left out of account, will lose more by the new exemptions than it will gain by the multiplication of the income grades and the inclusion of the stock companies. Whether this resulting deficiency, estimated at less than two million marks, will be covered, or more than covered, by the sharper assessment, Dr. Miquel declines even to guess. Similar assessment devices raised the revenue from the income tax in Saxony 20 per cent. in five years. A like increase in Prussia, where the income tax in 1889 90 yielded sixty-six million marks, would justify an estimate of at least sixteen or seventeen millions larger revenue as the net result of the changes in all taxes.

But the proposed reform does not deal at all with the most troublesome part of the Prussian tax question, viz., local taxation. At present, local expenditures are met by a surtax, or addition to the State tax; but for several years there has been talk of handing over the trades and industries, or, as in Pennsylvania, the real estate, for local taxation. Minister Miquel talks with admirable indefiniteness about his intentions—sometimes he calls them simply hopes—of doing something of the sort as a result of the pending reform, or of measures based upon it. There the ambitious parliamentarian once more gets the better of the financier.

GENERAL JOHNSTON.

THE death of Gen. Joseph E. Johnston (which occurred at Washington on Saturday evening), so soon after that of Gen. Sherman, at whose funeral he was one of the pall-bearers, will seem to the country a coincidence giving a dramatic completeness to the history of these great men who were antagonists in the critical campaigns of Atlanta and of North Carolina, in which the fate of the rebellion was sealed. They had also been personally pitted against each other in the subordinate campaign of central Mississippi after the fall of Vicksburg. Thus it happened that from July, 1863, till Johnston's surrender near Raleigh at the close of April, 1865, and from the Mississippi River eastward to the ocean and thence northward nearly to Virginia, the fortunes of the nation were staked upon the military leadership of these two men—the one, with tireless aggression, leading the Union armies ever deeper into the heart of the Confederacy; and the other, with sleepless wariness and signal ability, exhausting the resources of the military art to neutralize the superiority of force on the national side, and to postpone to the latest hour the downfall of the cause to which he had devoted himself. This great duel will always be the part of his career first thought of and most vividly recalled when Johnston is named, but he had been prepared for this work by a long military career reaching back to a time which few living persons have seen.

Joseph Eccleston Johnston was a native of Prince Edward County, Virginia, born in February, 1807. He was graduated from West Point and entered the United States Army in 1829. With the exception of a single year (1837-'38) when he tried his fortunes as a civil engineer, he was constantly in the military service of the Government till he followed his seceding State in April, 1861. He was a captain of topographical engineers on the staff of Gen. Scott at the beginning of the Mexican war, in which he was twice wounded and was brevetted major, lieutenant-colonel, and colonel for gallant conduct and meritorious service, entering the City of Mexico as commandant of the Voltigeur

regiment which he had brilliantly led in the latter part of the campaign, and in which he was appointed Lieutenant-Colonel. His regiment was disbanded on the reduction of the army after the war, and he returned to duty in the corps of topographical engineers. He served as Inspector-General with the Utah expedition of 1858, and in June, 18 0, he was made Quartermaster-General of the Army with the rank of brigadier-general.

On the secession of Virginia, he resigned his commission and went to Richmond, when he was immediately made Major-General of Virginia troops by Gov. Letcher. He tells us in his narrative that "no other officer of the United States Army of equal rank, that of brigadier-general, relinquished his position in it to join the Southern Confederacy." This was literally true, though Lee was his equal in age, both being fifty-four, and nearly his equal in rank. They had served together in Mexico and had been side by side in much of their military duty. They resigned together, and together were appointed to equal rank in the Virginia army. They entered the service of the new Confederacy together as Brigadiers, and were together made generals when that grade was created by the Confederate Congress. A day or two may have separated them in one or another of these steps, but for all practical purposes they were simultaneous.

Johnston's first command in the civil war was at Harper's Ferry, where he organized the forces that were assembled to cover the Shenandoah Valley on both north and west. When the advance of the national army under McDowell against Beauregard became imminent, Johnston transferred his command to Manassas, and in the battle which followed he was in command as the ranking officer on the field, though he gave such full scope and recognition to the energies of Gen. Beauregard as to prove that the position of second in command could be made a most brilliant one instead of the dubious and undesirable thing it is commonly reckoned.

The results of his successful engagement, while putting him officially in the lead of all the Confederate officers, planted the seeds of subsequent griefs and disappointments; for controversies arose as to the personal relations of Mr. Davis, as Confederate President, to the campaign, in which the President's susceptibilities were wounded. A personal antipathy was excited between him and Gens. Johnston, Beauregard, and G. W. Smith, which was never healed, and which affected permanently the fortunes of these officers. The law passed by the Confederate Congress in May, 1861, provided that as between officers of the same grade in the Confederate Army who had gone from the United States service, seniority should be determined by their former rank. Under this rule Gen. Johnston was senior of the five generals created, the others being Cooper, A. S. Johnston, Lee, and Beauregard. But when in August Mr. Davis sent in his nominations to the Senate, he fixed arbitrary dates at which the commissions should take effect, so that Joseph Johnston was reduced from first to fourth place. Against this the latter protested, but it was held that the confirmation by the Senate gave to the change the effect of law. The antagonism thus created was permanent, and rendered cordial coöperation between Davis and Johnston almost impossible, though both were undoubtedly devoted to the cause in which they were embarked.

Johnston remained in command of the Confederate Army before Washington during the year, and when, in the spring of 1862, McClellan transferred the Army of the Potomac to Fort Monroe, Johnston confronted him on the Peninsula, and from Yorktown to the Chickahominy illustrated the stubborn and skilful defensive strategy for which he afterwards became still more famous. At Seven Pines, on the 31st of May, he thought the looked-for opportunity to assume the offensive had come, and combined an attack by several columns upon a fraction of McClellan's army which had crossed the Chickahominy, then bankfull from a freshet and endangering McClellan's bridges. The bloody engagement of the day was indecisive, and near its close Johnston was wounded by a musket-ball and soon after unhorsed by a fragment of a shell which severely injured him. He was borne from the field when, as he tells us, he was about to give orders for his army to rest upon their arms and to renew the fight in the morning.

He was disabled for several months, and Lee succeeded to the command in which his great reputation was made. In the latter part of November Johnston, having recovered from his wounds, was assigned to command a military division in the west, including the departments of Bragg, Pemberton, and E. K. Smith. President Davis visited the west soon after, and endeavored by personal inspection to determine the lines of operation and the general policy which should control the four Confederate armies at that time in the Mississippi Valley. The antipathy of the men was such that no harmony was possible. Mr. Davis gave directions to such an extent as to make Gen. Johnston feel that his command was a merely nominal one, and rejected the plans which the General submitted. Johnston's health was also wretched, so that he looked back to that period with great disgust. The battle of Stone's River and the retreat to the Tennessee were conducted by Bragg as his subordinate in one department. The campaign and siege of Vicksburg, with the consequent stunning blow to the Confederate fortunes, were conducted by Pemberton in like relations to him. Pemberton overestimated the importance of preserving Vicksburg, and allowed himself to be shut up in that city when Johnston's orders were to break away while it was possible, and concentrate at Jackson, where Johnston himself was with a small army. The latter asserted that if his physical strength had been equal to it he would have joined Pemberton with an escort of cavalry, riding around the army of Grant. He would thus have assumed the immediate control of that campaign.

The winter of 1863-64 had destroyed the prestige of Gen. Bragg, and Johnston was ordered to supersede him in command of the Army of Tennessee. In this, as in later assignments to duty, the force of public opinion in the Confederacy constrained Mr. Davis, who acted unwillingly. Bragg, who retained Davis's friendship and confidence, became chief of staff to the Confederate President, and Johnston felt (rightly or wrongly) that the support given him was coldly perfunctory, and that his campaign would be watched at headquarters with unfriendly eyes. Mr. Davis strongly urged a dashing, aggressive policy. Johnston thought his force insufficient to adopt it with much chance of success. Persistence in his opinion was a marked trait of each of them; Johnston adhered to the policy of watchful defensive war, which he believed in by sincere conviction if he adopted it by natural temperament.

His campaign against Sherman is admitted to be a model of its kind. He was forced back mile by mile through half the length of Georgia, but each step in retreat was taken in perfect order, with no sacrifice of material, and with as little loss in men as was possible considering the incessant fighting which for three months had hardly a single day's intermission. There were no pitched battles in open field, for both Sherman and Johnston had developed the idea, now generally accepted by military men, that the increase of range and precision in modern firearms has necessitated a warfare of entrenched lines of field-works. The slow but steady retreat from Dalton to Atlanta gave to Mr. Davis the opportunity to insist upon his fixed idea of the dashing aggressive, and Johnston was removed. The practical destruction of the Confederate army under Hood is more conclusive than any theoretic argument as to the merit of the two systems in such circumstances, for Hood showed no mean ability in his campaign.

When Sherman had marched to the sea, and again, moving northward, was about to enter North Carolina, an overwhelming public sentiment demanded the reinstatement of Johnston. Mr. Davis was unable to sacrifice his personal pride and his rooted prejudice with a good grace, and the Confederate Congress in substance deposed him from the command-in-chief by giving this to Gen. Lee. Lee immediately assigned Johnston to the task of opposing the resistless march of Sherman. Though it was too late for great success, Johnston showed that he knew how to depart from his Fabian policy when occasion offered or necessity demanded. Directing Gen. Hardee with part of the forces hurriedly collected to delay the march of Sherman's column from the South, he sent Gen. Bragg with another portion to strike the forces which Schofield was leading from Newberne. This was to gain time to concentrate reinforcements at an intermediate point, and to precipitate his army by interior lines first upon Sherman and then upon Schofield. Neither Hardee's affair at Averasboro' nor Bragg's at Kinston was more than a check to the national armies, which continued their movements of concentration; but the strategy was none the less sound, and the execution was vigorous. It was met by a tenacity and readiness which prevented its success.

Quickly drawing together his detachments, he met Sherman again at Bentonville; but though he held his lines during a hard-fought day, he had to retreat by night when Sherman's columns were united and the superior force could be skilfully made to tell. Sherman met Schofield at Goldsboro' in exact accordance with his own plan, and Johnston's brilliant activity had accomplished little in material results. It had demonstrated, however, that no one could surpass him in a vigorous initiative when he chose to use it, and gave a conclusive answer to critics who insisted that his only rôle in war was the strict defence.

Still undaunted, he led his army to the west of Raleigh so that Sherman should not march into Virginia without offering his flank to attack. But the end had come. Lee surrendered, and though Mr. Davis, with characteristic stubbornness, thought that a new retreat by Johnston across the Carolinas and the Gulf States was feasible, and hoped that even in Texas a stand might be made, Johnston had the moral courage to insist that the war was over, and that mere brigandage or guerilla fighting without possible advantage would be the only consequence of what Davis proposed. A still more fearful scourge of the Southern States might have followed, but no result that

a statesman or a general could find satisfaction in.

Left to himself, Johnston negotiated an honorable surrender, and secured for his disbanded army not only personal safety, but the means of reaching their homes to resume peaceful industry. Like Lee, he put the war utterly behind him and used his great influence with the Southern people to renew the national allegiance in good faith, and to cultivate a new patriotism that should embrace the whole country. To that purpose he was true for a quarter of a century, and lived to have abundant proof that in the breasts of the most ardently loyal men of 1865 no sentiment towards him but respect and personal kindliness had survived.

As to his greatness as a military commander, the universal verdict declares that on the Confederate side only Lee could contest his preeminence. It would be, even now, a premature effort to seek to measure their relative capacity. The circumstances in which they acted were not the same, the national armies and generals against whom they were arrayed were unlike, the support they received from their own Government and the freedom of judgment and action given them were often in strong contrast. Each supported with consummate ability and with unfaltering constancy a cause which was at war with the progress of human liberty and true republicanism, and which was therefore predestined to defeat. Each met his reverses with a quiet dignity which made it easy for old antagonists to become their friends and admirers. Each so honestly helped to rebuild the new nationality on freedom and brotherhood that the whole nation has joined in rehabilitating them, and we bury them as honored fellow-citizens.

THE GEOGRAPHICAL EXHIBITION OF THE BROOKLYN INSTITUTE.

THE exhibition of geographical appliances brought together by the Department of Geography of the Brooklyn Institute, now open in the Arcade Building, Fulton Street, is decidedly the most successful of its kind ever held in this country; and it may be favorably compared with similar exhibitions in Europe. Its large series of maps, models, globes, atlases, and diagrams is most suggestive of the continually growing attention given to this fundamental department of our schooling. We are glad to learn that the exhibition has been well patronized, having had, as is estimated, an average attendance of a thousand persons a day since it opened at the beginning of the month, with overcrowding on Saturdays. It closes this week in Brooklyn, but we trust that the plan of the Institute to open it again in other cities, New York included, may be successfully carried out.

We are sure that the school board of any large city would find a very profitable occupation in coöperating with the Institute in this respect. The exhibition excites much interest among school-children by showing them new illustrations of subjects more or less familiar; it has the excellent effect of inspiring teachers to renewed efforts towards improving their materials and methods; it shows our publishers a grand series of European works, behind which ours fall so far; it offers to school superintendents the best possible opportunity of choosing new materials with which to replace what is old-fashioned or worn out; and, perhaps more important than anything yet mentioned, it presents to intending geographical writers a very good summary of what has been already accomplished. For all these reasons, the Geographic Department of the Institute will be well rewarded for its heavy labor and not slight expense.

The catalogue of the exhibition is divided into nine departments—maps, globes and telluriums, reliefs, models and apparatus, pictures, atlases, text-books, reference books, and miscellanies. These departments are again divided; for example, the first embraces maps of the World, America, Europe, Asia, Africa, and Australasia, and various detailed topographic surveys of small areas. The classification is in a few cases at fault; thus, the specimen sheets from the official Austrian Geographical Institute, No. 236 A, should have been placed under detailed topographic maps, rather than under maps in sheets; but we are inclined to believe that this slight confusion results from the great size to which the exhibition has grown and the moderate number of workers, all volunteers, on whom the labor of arrangement has fallen. With more time, the classification might have been carried further to advantage, so that, for instance, all political maps of Europe might have been separated from the physical maps; the geological maps of Bavaria, again, should have been placed with the special topographical maps under a joint heading. But as a whole there is little to criticise, and we make these few comments rather as suggestions for revision in case of exhibition in other cities than as reflections on the patient work of the Committee. It might be well to consider whether, in case of repeated exhibition, it would not be better to place all the publications of a single house together, as far as possible; purchasers could then judge much better of the effect produced than now, when the several maps of a series are scattered in different parts of the room. A set of maps as published seems to us a natural unit for exhibition. At the same time, the catalogue might remain divided according to subjects and countries, the numbers then remaining as cross references.

The exhibition is so large that it is impossible to mention more than a few of the most interesting of its parts. Of these, we may take first the wall maps of physical geography. Kiepert's series (Berlin: Reimer) is the most attractive from the well-chosen tints of brown and blue by which the relief of the land is indicated. These maps are clear and emphatic for class use; but, in their entire omission of names, they are sometimes embarrassing. In leaving the lowlands and all of the oceans but the shore-strip uncolored, this series is perhaps less satisfactory than others by Bamberg (Berlin: Chun), or than the Habenicht-Sydow series (Gotha: Perthes); but the last of these are too coarse except for the largest classes. One of the finest Mercator charts of the world in the collection is by Broichmann (Metz: Lang), a very artistic work. The world in hemispheres is best shown by Kiepert and Bamberg. It is noticeable that ocean currents are the most variable features on these physical maps, and that in nearly all they are too emphatic, too sharply defined.

Certain physical maps of single regions deserve special mention. Two of Great Britain and Ireland, published by Stanford of London, illustrate what we need for our own country; and now that a comparatively accurate contour map of the United States has been constructed under the direction of Mr. Henry Gannett of the Geological Survey, we hope our publishers may take advantage of it, and give us something comparable to what can be found for the European countries. One of the Stanford maps is called the Orographic, indicating successive altitudes by a series of green and brown tints; the other is the Stereographic, in imitation of a model, with the light coming from the northwest. The emphasis thus given to the relief is really rather too great; it reminds us of the exaggeration of models as commonly constructed. There are two maps of the Alpine region of central-southern Europe that call for high praise. One is by Von Haardt (Vienna, Hölzel), and is to be strongly commended for class use. The other is by Randegger (Zurich: Wurster), and embraces a somewhat larger area; it is of rather finer work and bears closer study, but both are excellent. There is also a hypsometrical map of France in ten tints on land and four on water by Hachette of Paris; and it should be added that this well-known firm has been most enterprising and generous in providing examples of its publications, in the form of maps, books, and atlases.

The detailed topographical maps are mostly of our own country. They are not for school service, but afford the very best basis for the advanced study of physical geography, in company with geological maps; they are also of the greatest value to publishers in the preparation of atlases and school maps of small scale. Our coast and geological surveys have done well in providing many examples of their work, which is but too little known by the people. It is to be regretted that the tinted relief-map of New Jersey is not exhibited apart from the series to which it belongs, in order to bring its existence more generally before the visitors. Various sheets of some of the older Government surveys are not exhibited for want of room; if the general chart of the Mississippi lowland by the Mississippi River Commission is among these, it should be brought to view, both for its excellence and its interest. Some of the special sheets of the same Commission ought to be placed beside the fine engravings of the Coast Survey. Of the countless political maps and charts we need only say that their bold colors are generally too bold, even for the needs of children.

Passing over the globes, which exhibit less variety and novelty than the other divisions, we come to the models. These are of varied excellence and badness. The best are by Locchi (Turin: Paravia), showing the regions about Rome and Naples in true vertical scale. The largest relief in the collection is sent by the same enterprising publisher; it is of Italy, by Cherubini, measuring nearly six by seven feet. Its vertical exaggeration is five-fold, and for this reason we wish that Paravia had sent the Pomba relief of Italy instead, because it is without vertical exaggeration, and especially because it is represented on a curved surface, thus giving not only true local relief, but also the true convexity of the earth, by which many interesting lessons can be taught. In this respect it is infinitely better than the vicious exaggerations of relief globes. We miss with regret the artistic models by Heim (Zurich: Wurster). Most of the other models are on too small a scale or of too rough workmanship to be considered seriously; those of this country are generally needlessly exaggerated. The mountain ranges on Frye's continents are so simplified as to be misleading even for elementary teaching. A certain audacious relief model "showing all the forms of land and water," by Hindshaw (London: Philip), is simply abominable in its absurdity. None of the continental models are as finely prepared as those made by the Mendeliefs for Butler's geographies, and these are unfortunately not on exhibition. King's useful models of Wisconsin are also wanting.

For want of space we can do no more than name a few of the pictures, books, and atlases. *Facile princeps* among the pictures are the "Geographische Characterbilder," published by Hölzel of Vienna. It is simply a matter of expense whether our high schools can get these works of art; there is nothing else nearly as good. They are all in colors, carefully prepared from the best originals that could be procured, and some are truly elegant in accuracy of expression and artistic finish. Our Shoshone waterfall, the hot springs of New Zealand, the glaciers of Switzerland, the plains of Hungary, Table Mountain behind Cape Town, and Kintchinjunga in the Himalaya, deserve particular mention. Several other series of illustrations are also exhibited, but none can approach these of Hölzel's. Of atlases, there are twelve or more of the best quality; one should examine them with care if he intends purchasing for a library, but the Institute has been over-generous in allowing these valuable books to be handled indiscriminately by all comers. In the subsequent exhibitions, the books should be railed off, and be accessible only to responsible persons who give their names and addresses. Text-books, readers, guides, and methods are in large number, forming a most satisfactory collection for examination by teachers.

It may be of service to mention that the officers on the Committee on the Exhibition are Mr. Cyrus C. Adams, Chairman, and Mr. W. S. T. B. Imlay, Secretary. Either of these gentlemen may be addressed, in care of the Brooklyn Institute, regarding the further exhibition of their collection.

LONDON ARCHIVES OF AMERICAN HISTORY.

LONDON, January 15, 1891.

THE student of American history who seeks in London for the sources of early Anglo-American annals is not content with the incomparable collection of books and manuscripts in the British Museum and in the Public Record Office, or in other repositories which the Historical Manuscripts Commission have made known, but he must seek to complement these with several other collections, hardly ever resorted to but by the eager student, and with little return sometimes then. These are the library of the Archiepiscopal Palace at Lambeth, the library of the Bishop of London at Fulham, that of the Society for the Propagation of the Gospel in Foreign Parts in Delahay Street, and that of the old society now known as the New England Company.

It may interest your readers to know something of the distinctive qualities of each of these minor repositories. While the collection at Lambeth dates back to 1610, when it was first started by Archbishop Bancroft, its collection of about 30,000 volumes is not of peculiar interest to the American inquirer. There are some early books of the seventeenth century, relating to New England and Virginia, but none of them are such as the well-equipped American scholar is not familiar with. I took pains to look at some of them, including a large-paper copy of Capt. Smith's 'Virginia' and Lechford's 'Plain Dealing,' in the hopes that I might find some contemporary MS. notes in them, but I was disappointed. There was a loose copy, in very excellent condition, of Smith's 'Map of New England' (1616) in an early condition of the plate; but there was nothing written on it, except some ciphering, very likely to sum up some merchant's ventures in sending trinkets to the New England coast.

The manuscripts at Lambeth are of more importance, but pretty much everything, I think, has been gleaned from them by students of the early history of the American Church, like Dr. Hawkes and Bishop Perry. The chief consecutive interest of the papers consists in the correspondence of the Archbishop of Canterbury and of the Bishop of Oxford, in the eighteenth century, with leading Episcopalians in the Colonies, either in relation to the interests of the Church there, or to the establishing of colleges in the same interests in New York and Philadelphia. So we find numerous letters from the Rev. Samuel Johnson, who became the President of King's College, now Columbia College, in New York, and whose honorable career has been so well told in a recent life by Dr. Baird, who, no doubt, was able to avail himself of all the material here. I saw one letter from Sir Harry Frankland, of Agnes Surriage memory, who described the condition of feeling in Boston in those days when the revolutionary spirit was yet in embryo; and numerous letters from such men as Timothy Cutler, who, having distressed Yale College on the question of Episcopal influence, came to Boston, and was not any better liked by the adherents of Harvard College when he tried to secure a hand in its management. There were also letters of Caner, the rector of King's Chapel in Boston. Some of these men sent extracts from letters of their opponents, and in that way we read something from the pens of Cotton Mather and Thomas Prince. An interesting letter from Jonathan Edwards, describing his methods of dealing with Indian neophytes at Stockbridge, would have interested his latest and best biographer, Prof. Allen, if, indeed, it had not already been brought to his attention. A letter from a Philadelphia Quaker, Anthony Benezet, in 1762, is of interest as an earnest protest against the slave trade. The severance of the Colonies from all connection with the English Church is prefigured in a communication to the Archbishop from Cutler and others, enclosing a petition to George the Third, urging the sending of bishops to America, and in the endorsement on it, that, in the then existing state of public opinion in the Colonies, it was not deemed wise to force an issue on that question, and so the petition was withheld. This was in 1761, the period when the discussion on the writs of assistance was going to give a rallying cry to the incipient party of patriots.

Connected with this class of papers are a number of papers on the Andros side in the controversy which ended in the collapse of that governor's administration in New England; but I suspect that Mr. Whitmore has availed himself of all of them in his edition of the Andros Tracts.

Outside of this class of manuscripts, we find something relating to the voyages of Sir Francis Drake and Sir Walter Raleigh, and one or two interesting papers on early arctic exploration and on the northwest passage by John Guy and William Morgan. The most important is a statement of what happened in Jamestown, Virginia, after the departure of Newport in 1607—quite within the range of Mr. Alexander Brown's 'Genesis of the United States,' and doubtless not unknown to that assiduous student. The later voyage of Henry Fleet to the Virginia waters has, I suppose, been already illustrated in print from the original MSS. which I find here.

The visitor at Fulham and to the library of the Bishop of London turns first to that manuscript 'History of Plymouth Plantation,' by its second leader Gov. Bradford, which in some way, probably because of the headship which the Bishop of this metropolitan see sustained over the American churches, found its way to Fulham at a time not long after, it would seem, some British officer bore it away—if, indeed, Hutchinson himself was not the bearer—after the opening of the war of independence. There is no occasion to repeat here the story which follows the strange vicissitudes of that manuscript—the corner-stone as it is of our New England history—till it was fortuitously brought to light and was printed by the Massachusetts Historical Society under the editing of the late Dr. Charles Deane in 1856. When Mr. Motley left Boston to undertake his mission at the Court of St. James, he asked me one day what he could do in London to further the interests of American history. I replied, "Get the Bradford manuscript returned to us." He later wrote to me from London that, with the Beaconsfield Government in power, it was not at all sure that an attempt to secure the passage of a bill through Parliament would be promising enough for the effort which it would require. A few years later, being in London, I went to Fulham; but, missing the Bishop, he later opened a correspondence with me respecting the MS., in which he regretted that his own power in the premises was not sufficient to make the surrender. This was Dr. Jackson, the late Bishop, who promised to interpose no objection if ever a bill was introduced into Parliament. Here the matter has since rested, and I have never felt that it was desirable to press the question, deeming that the precious document was quite as well off where it is as to make it the subject of contention as to whom it should be given to. The fact is, that the book itself shows that it was only deposited in the Prince Library, and the heirs of Gov. Bradford never yielded their property in it. To return it to private custody in America does not seem to me desirable. The claim of the Prince Library, or the Boston Public Library, through their trusteeship of the Prince Library, which doubtless had possession of it at the time it was abstracted and sent to England, has no validity that Parliament could recognize; and any surrender on the part of Parliament would most likely be in favor of the Government of the United States, which would bring the treasure into the custody of the State Department or of the Library of Congress, in neither of which places, in the present arrangements at Washington, would an historical student like to see it. Therefore one looks upon it at Fulham as not altogether in a place unfitting for it, for its value is not unknown by those in charge of it.

There is in the muniment room at Fulham a large mass of papers relating to the times when the Episcopal Church in the American colonies was within the jurisdiction of the see of London. I saw them some years ago, covered with dust, tied up in packages, and stuffed away in large bins surrounding the room. They are now in the same condition, only with a dozen years' more accumulation of dust upon them. It is utterly impossible to give them any examination at present. They not unlikely go back to the time when it was attempted without success by Popham and Gorges to establish Episcopacy on the New England coast long before the Separatists of the *Mayflower* began a successful settlement, and I suppose that the papers came down to a period when the war of independence put an end to the oversight of the Bishop. That they may have been in some part used by Bishop Wilberforce and by Anderson, forty or fifty years ago, in their essays to write the history of the Ameri-

can Church, is quite possible, and some share of their present disarrangement may be due to the efforts of those writers to make researches among the papers. I am glad to learn that the present Bishop is sensible of their importance to American students of history, and is intending to have them arranged and bound. It is hoped that this may be accomplished in three or four years.

In the building in Delahay Street, close by the Government offices, there is every symptom of an active business agency, pertaining to the administration of the Society for the Propagation of the Gospel in Foreign Parts. Beginning in 1701, the Anglo-American colonies held no small share of the attention of this body in their effort to convert the native red man of America; and their long series of printed reports, with the much more extended reports in manuscript which they preserve, together with the original correspondence of their missionaries, furnished in the first instance the materials for Humphrey's history of their missions to 1730, and for Canon Hawkins's continuation down to 1785, which was published in 1851. For Humphrey's book, Herman Moll, the leading English geographer of his day, made some maps which the student of American geography as it was understood in the early part of the last century finds useful; and he would particularly like to collate the maps, sent home by the missionaries, upon which that cartographer worked. That there was such a collection of drawn maps the records of the Society show; but I find that all trace of them has been lost. The manuscript records of the society and their accompanying original papers begin in 1702, though there are occasional papers of a much earlier date—I noticed, for instance, a copy of a record regarding Harvard College dated in 1642—kept on their files in attested copies of the eighteenth century. These original papers refer in large part to Massachusetts, to New England as a whole, and to New York; and numerous volumes stand on their shelves, of dates running from 1702 to 1784, at or before which last date the Society withdrew its missionaries as being no longer in British territory. American students, as I have said, like Dr. Hawkes, Bishop Perry, and, working in a more secular way, Dr. Edward Eggleston, have in the past found the officers of the Society quite ready to welcome them to these treasures. I am glad to say that the present librarian is now engaged on a digest of such of their early records as relate in particular to their American labors, and it will not be long before the student can profit by his results in print.

Another kindred society, but unfortunately without documentary annals of like value to the American historian, is one which now passes under the name of the New England Company. It originated in 1644, in the Long Parliament, under the title of "A Corporation for the Promoting and Propagating the Gospel of Jesus Christ in New England," and it was under its patronage and that of its successor that the labors of Eliot, the Indian apostle, were made conspicuous, and such publications as what are known as the Eliot tracts and the Indian Bible and other versions of religious books were in part made possible. The Restoration in 1660 of course put an end to all ministrations which the Puritan Parliament had instituted; but the desirableness of the work which the society had done was not questioned, and it took a new lease of life two years later, by virtue of an act of Charles's first Parliament, and went on with its work under the style of "The Company for the Propagation of the Gospel in New England and in Parts Adjacent in America." The successful outcome of the Declaration of Independence debarred their action within the new republic; and, after remaining at rest for some years, their agencies again moved, and the province of New Brunswick was made their field, as being still "in parts adjacent to New England." The dying out of the Indians in that region drove them to more remote fields, and they are now expending about £3,500 a year on missions in Ontario and British Columbia.

There are efforts now making at Guildhall in the "City" which will be of interest to the American genealogist and student of English municipalities. This latter subject has not escaped the attention of American students, and the English workers in the same field recognize the importance of Dr. Gross's recent book on the English guilds. I find this new book on the counter at Bain's—perhaps on the whole the book-shop in London most resorted to by the reading class of the higher stamp; I see it on the ledges at the Athenæum Club, and it was lying on the table in the Committee-room of the Guildhall Library when I was there yesterday. The movement to which I refer is the gathering in the Guildhall Library of the records—not in immediate use—of the parishes and wards of the "City." It will take some time, doubtless, to bring the efforts to a conclusion, and to reconcile the present guardians of these records to the transfer; but a sort of Public Record Office for the "City," somewhat equivalent to that of the Government offices, is certainly desirable. There were a great many Londoners among the early settlers of New England, and one finds local names in our villages that tell how these Londoners had the art of comparing small things with great. In two contiguous villages on the Massachusetts Coast, there is a brook called to this day Hound's Ditch, and a neighborhood called Wapping. JUSTIN WINSOR.

Correspondence.

INTERNATIONAL COPYRIGHT.

TO THE EDITOR OF THE NATION:

SIR: I trust that you will allow me a small space to comment on the article "Law and Theft" which appeared in your paper of February 12. Reference is there made to a short article of mine which I was asked to write, and which I believe has appeared in more than one American newspaper. The writer of "Law and Theft" has altogether misunderstood what I said in that article.

The writer of "Law and Theft" seems very fond of saying that I have confounded things. I have "confounded the question of right with the question of security"; I have "confounded plagiarism and piracy." Now, I have not confounded anything; I have only distinguished things that the writer confounds.

His whole argument against me goes on a misconception of what I have said. He begins by saying that I hold that "all property, and especially literary property, is the creation of law." This is his first confusion. I have said nothing about "literary property"; I have avoided the words, because they are likely to lead to the confusion into which the writer of "Law and Theft" has fallen. Because I hold that a certain privilege, which may, in a certain secondary sense, be called "literary property," is the artificial creation of law, he thinks that I hold that all property is the creation of law. He attributes this doctrine to me more than once. But I have said nothing of the kind, either in the paper to which he objects or anywhere else. I have not gone into the origin of property, which is much too hard a question for me. I have simply said that copyright is not what one may call natural property, like a man's goods and clothes, but that it is, what it certainly is, an artificial privilege granted by law. One main object of government is the protection of what one may call natural property. One might even say, though it would be rather dangerous to say it, that governments were called into being in order to protect such property. But one certainly cannot say that governments were called into being in order to protect copyright. Copyright is not likely to be thought of till governments have been in being for ages; it is a privilege which, in certain advanced states of society, it is just and expedient that governments should grant to their subjects or citizens; but it is an artificial privilege all the same. The difference between the natural right and the artificial privilege is obvious. A man is held justifiable, in all times and places, in using physical force to hinder another man from taking his purse out of his pocket. In no time or place could he be held justifiable in going into a "pirate's" printing-office and hindering him by physical force from printing a book of his writing. For the privilege infringed by the pirate is the creation of law, and the sufferer must go to the law for his remedy. The right infringed by the highwayman is a right older than law; the wronged man has, therefore, if law is not ready to help him at the moment, to make use of a remedy older than law.

The writer of "Law and Theft" seems not to see this distinction. He therefore charges me with "confounding right and security," and puts into my mouth the proposition which I have nowhere maintained, that all property is the "creation of law." He goes on to put into my mouth another proposition, which also I have never maintained, namely, that "it is highly indecent to speak of persons who publish other men's works without paying for them as 'thieves and pirates.'" What I did say was, that it was neither becoming nor truthful to apply such names as "thieves" and "robbers"—I said nothing about "pirates"—to the House of Representatives of the United States, or to any other legislative body in any country, on account of any measures which it may pass or refuse to pass on the subject of copyright. It did not come into my thoughts that the House of Representatives could be held to come under the head of "persons who publish other men's works without paying for them."

The writer of "Law and Theft" further says that I "confound plagiarism and piracy." I do no such thing. "Plagiarism" and "piracy" are both of them words which imply an odd metaphor; but I will take both of them as they are commonly used. By a "plagiarist" I understand a man who publishes another man's writings under his own name. By a "pirate" I understand a man who publishes another man's writings with the real author's name, but who gives the real author no share of the money which he makes by publishing them. The "plagiarist" lessens the real author's reputation; he makes a false reputation for himself at the cost of another man. The "pirate," if his edition be accurate, spreads the reputation of the author; he simply omits to give him money. Now, as I hold reputation to be higher than money, my worst complaint against pirates is that their editions are not accurate. An American publisher once reprinted my little book, 'General Sketch of European History.' I forget whether he paid

me any money or not—that is, I forget whether he was a "pirate" or not; but in either case he did me a much worse wrong than any mere omission to pay me money. For he changed the title of the book into 'Outlines of History.' That is, he did me a wrong by changing my title at all; he did me a worse wrong by changing a title which described the objects of the book into a title which did not describe them. Does not the author of "Law and Theft" see that, if the pirate printed my book as I wrote it, he only omitted to give me something? And, in the case of an American citizen, the obligation to give me anything could arise only out of the law of the United States. But the obligation to print my book as I wrote it, if he printed it at all, was an obligation older than the law of the United States, older than the law of Solon or Moses. By changing my correct title into an incorrect one, he did take something from me: he did a damage to my reputation; he represented me as describing my book in a way that was not truthful; he represented me as promising All History and giving only European History. And by changing either the title or any other word in the book, even supposing every change was an improvement, he was guilty of falsehood by representing me as saying something which I had not said.

There is really no practical difference of opinion on the subject of copyright between me and the writer of the article "Law and Theft." If I rightly understand him, he holds, exactly as I hold, that it is just and expedient that all governments should grant the privilege of copyright both to their own citizens and to strangers. I set forth that position as strongly and clearly as I knew how in the little article to which he objects. He and I have got to the same conclusion by different roads; that is all, only I think my road is the best, because it is the path of fact. While he thinks that I have confounded this and that, I think that he has confounded several things which I have distinguished. Both the propositions which he puts into my mouth are propositions which I have never made. The practical conclusion that I proposed was, that Great Britain and the United States should each grant to the subjects or citizens of the other Power such privileges in the matter of copyright as are, by its own law for the time being, enjoyed by its own subjects or citizens. Does not that satisfy the author of "Law and Theft"? It is hard to see what more can be asked for on either side. Only with that proposal I joined, and I still must join, the comment that, if the Legislature of either country should refuse to grant such privileges, that Legislature is not therefore to be spoken of as a "House of Thieves."

—I am, sir, your obedient servant,

EDWARD A. FREEMAN.

OXFORD, February 27, 1891.

[If Mr. Freeman does not think all property the creation of law, what does this passage from his original letter to the Philadelphia *Press* mean ?

"Now, it is very hard to say what natural right is. Philosophers have often disputed over that point. But roughly and practically, a man may be fairly said to have a natural right to his life, and to his property lawfully gained—always remembering that what is a lawful way of gaining property in one country may not be so in another. Every one expects, both in his own country and in any other, that the supreme power of the State will hinder anybody but itself from taking his life or property, and that it will not itself take them except by legal process.

"Can it be that what is called 'copyright' is a natural right in anything like this sense? Copyright means that when a man has published any writing, all other people are to be hindered from publishing that writing without his consent. Now this surely is not a natural right, but a very artificial privilege, one which could only have been thought of in a very artificial state of things. It cannot be said to be a natural right in the same sense as the safety of a man's life or of his house. It cannot be said that the supreme power, either of my own country or of any other, is as obviously bound to hinder people from reprinting the 'History of the Norman Conquest' against my will as it is obviously bound to hinder me from being knocked on the head, or robbed on the highway, as long as I am under its jurisdiction. One would say, that if there is any natural right at all in so very artificial a matter, every one has a *prima facie* right to publish what he chooses. That right the law of any country may wisely and justly restrain. But surely the mere natural right is on that side rather than on the other."

We see here that although "natural right" is something difficult to define, we nevertheless need not hesitate to say that a man's natural right to his property can only cover property "lawfully gained," that is, gained in the way prescribed as lawful in the particular country in which he gains it. There is a statute of William III. which authorized any Protestant meeting a Catholic in Ireland riding a horse worth more than five pounds, to take the horse from him and become its owner, on tendering five pounds. In this case the law simply withdrew its protection from the Catholic's property in the horse when the five pounds were tendered; but did "the natural right" to the horse pass over, *ipso facto*, to the Protestant? In like manner, in this country, before emancipation, negroes were hired out as servants in great numbers to other people by their owners, and the owners pocketed the wages. Who had the natural right to the wages in these cases, the slave or the owner? The State withheld its protection from the negro's wages; did not the negro thereby lose also his natural right to them ?

In admitting that the State has the right to say in what manner a man must become possessed of a thing in order to make it legal property, Mr. Freeman really concedes what we contend for. He really holds that all property has a legal origin. We hold, on the contrary, that property has a moral origin, and that the fruits of a man's labor and self-restraint are property whether the State protects them or not, or whether there exists a State to protect them or not. They are his property in the desert or in mid-ocean, in London or in Timbuctoo, provided that in acquiring them he has "lived uprightly, hurt nobody, and given every man his due."

As to the argument that copyright is not a natural right, but "a very artificial privilege" which "could only have been thought of in a very artificial state of things," we answer that this argument would also cover bills of exchange. That bills of exchange are property, and that forging the payee's name on the back of one of them is a crime, and a very serious crime, are propositions which only a high state of civilization could produce. They would be rejected as absurd by barbarians. The advance of civilization is constantly producing new forms of property, but the title by which the owner holds them is always the same. It is not in the smallest degree shaken by the refusal or neglect of the State to provide protection for them. Life, Mr. Freeman says, is "a natural right." But the law in ancient Rome allowed, as in modern China, a father to decide whether he would rear his children or allow them to perish. Did the child lose its "natural right" to existence because the father could murder it with legal impunity?

The law is as obviously bound in the forum of morals to hinder people from reprinting and selling Mr. Freeman's 'History of the Norman Conquest' as it is obviously bound to hinder him from being knocked on the head or robbed on the highway, as long as he is under its jurisdiction. Mr. Freeman's use of the term "bound" shows that he is conscious that in matters of this sort the law, too, acts under the rule of duty, or, in other words, that it is constrained by a higher power; that in providing or refusing protection it is subject to other considerations than mere prejudice or convenience.

Mr. Freeman's notion, expressed in another part of his letter, that an argument against a man's natural right to his books is to be found in the fact that no author thinks of defending himself by force against "piracy," as he would defend himself against attempts to murder or rob him, is a striking illustration of the confusion wrought in this discussion by the novelty of literary property. The reason why authors do not resist piracy, club or pistol in hand, as they would resist burglary or murder, is simply that they are an exceedingly small body, and are generally men of sedentary habits and peaceable disposition—not that they are insensible to the wrong done them by the sale, for other men's profit, of the product of their industry. As authors worth pirating they are in every country a class containing a few hundred individuals, while as owners of other kinds of property they belong to a class which comprises the whole population, except paupers and thieves. To ask authors, therefore, why, if they think their books are property like other property, they do not defend it *vi et armis*, as they would, in the absence of police, defend their watches and money, is to ask why the customs of a community are settled by ninety-nine-hundredths of its members and not by the remaining one-hundredth.

How large a part the ambiguous and deceptive use of words plays in this discussion is also illustrated by Mr. Freeman's observation, in the above quotation, that "one would say if there is any natural right at all in so very artificial a matter, every one has a primâ-facie right to publish what he chooses." Now, the snare in this sentence lies in the word "publish." The term, as used by authors and literary men, means simply to make known certain facts or ideas to the world through a printed book or pamphlet. This is undoubtedly the sense in which Mr. Freeman uses it here, for in another part of his letter he says: "Primâ facie, a man who reprints an author's book is doing him a service; he is increasing the circulation of the book and its means of doing good." In this sense, too, the Pirates use it when they

deny the existence of "property in ideas," and maintain that the conceptions of an author's brain are or ought to be the common property of his fellow-men, open to appropriation by all for the general improvement of the species. It was in this sense that Dr. Crosby used it when he came to the defence of the Rev. Dr. Funk, then engaged in "publishing" a stolen edition of the 'Encyclopædia Britannica.' But when used in the discussion of the question of copyright, it means the sale of an author's work at a price which will cover the cost of mechanical production and yield a profit to the vendor.

When a Pirate is contemplating the theft of a book, he does not say, "Shall I by reprinting this work add to the author's fame, and contribute to the higher happiness of my fellow-men, and assist poor boys in getting their education more cheaply?" He says simply, "How much money would there be in this venture for me? Let me see"—and he takes his pencil and figures on cost of production and probable sales, and discusses with his partners the chance of some other Pirate getting into the market before him. So that what we mean when we deny the right of Pirates to "publish" other men's books is that we deny their right to sell the fruits of another man's industry in open market without his consent, *and in competition with him.* Piracy does not mean spreading abroad a man's ideas or his fame, or using him in any sense for the good of humanity. It means treating as vendible property in the Pirate's hands a thing which the Pirate has taken from the author on the plea that it could not be vendible property in his hands, and answering his remonstrances by showing him that for this particular wrong there is no legal remedy. That authors have listened to this defence so long without a single resort to violence proves to us, not that they are conscious of possessing no moral right to what their brain has coined or their industry collected, but that they are a small, pacific, long-suffering, physically delicate, and singularly non-gregarious body of men.—Ed. Nation.]

THE EFFECT OF THE COPYRIGHT ACT.

To the Editor of The Nation:

Sir: Referring to your remarks on the working of the Copyright Act, will you permit me to show why some of your views seem to me incorrect? In the first place, the *Nation*, in common with all other American literary journals, greatly exaggerates the importance of the bill, considered otherwise than as an expression of moral obligation. The only effect of the bill for ten years, at least, will be to increase, in a small degree, the profits of a few novelists like Mrs. Maxwell and Mr. Haggard, and of a few writers in the magazines whose articles are read chiefly on account of their authors' celebrity in other fields. The increase in the novelists' profits will be small, first because they already (especially since the rise of the syndicate system) receive considerable sums for serial rights, and secondly because the sale will be greatly decreased. People who, twenty years ago, never bought novels, but borrowed them from circulating libraries, have, since such works became everywhere accessible in convenient shape and at a low price, bought them almost to as large an extent as they formerly borrowed them. Such works, now sold to dealers at seven cents (with almost no expense for freight) and retailed at twenty-five cents at railway stands and at seventeen cents in large shops, will hereafter cost (say) fifty cents, while, owing to the absence of competition, the discount (and incidentally the ability to keep on sale a considerable stock, including the better as well as the worse class of books) will be lessened. The novel-reading public, meanwhile, will be driven either to lending-libraries or to reading other than *new* books by well-known authors.

It is, however, the position of authors who are not well known which I wish to consider. You say that "the foreign author will be in exactly the same position towards the American publisher as that now occupied by the American author." Is this true? A native author offers his book to a publisher who refuses it; he then offers it to a second, a third, or a tenth publisher, and finally it is accepted. Obviously the publishing interests at home of a foreign author will not allow the delay necessary for negotiations occupying, as these would, several months. Moreover, a work may have eventual pecuniary value, but not be immediately available; in such a case the native author merely postpones publication, while with the foreigner it is now or never.

I think the supply of cheap reprints will be as large as now, though the average merit will be less. He who wishes to read William Black or Mrs. Oliphant will have to inconvenience himself somewhat, but a new 'Robert Elsmere' would be as cheap as under the present system, because no publisher will take risks on an author without a reputation when he can reprint nineteen books out of twenty without payment. Out of the ten novels published weekly in Great Britain, it is improbable that an effort even will be made to place more than one in this country, so there is no fear that a plentiful supply of cheap fiction—such as it is—will be lacking.

The chances for unknown authors of works of scholarship are, of course, even less favorable, because the costs of production are greater, and facilities for distribution smaller. As to this class of authors, you remark that "the alternative of publishing the book at his expense is, it is true, open to him, but it will also be open to the unknown foreign author." From the casual way in which you mention the matter, one would suppose that publishing at the author's expense was an unusual proceeding, whereas I believe it to be, with works of scholarship, very common; and the historian or man of science who might be able to afford one set of plates (and that, probably, for the professional rather than the pecuniary rewards which are possible) would find the cost of a second set out of the question.

W: M. G.

THE RAIMONDI COLLECTIONS.

To the Editor of The Nation:

Sir: The Peruvian Government has decided to sell the large and valuable collections and accompanying manuscripts of the late Prof. Antonio Raimondi. Raimondi was enthusiastically devoted to the interests of science and of his adopted country—so much so that he left his family in straitened circumstances. His great ambition was to publish a complete treatise on the geography, geology, and natural history of Peru. He spent nineteen years in the interior of the country, enduring hardships and perils which would have appalled a less enthusiastic man, and accumulated a vast amount of material for his work. He then spent many more years of constant labor, arranging his collections and preparing for the publication of his researches.

The Peruvian Government made a contract with him to this end, but the war with Chili rendered it impossible to carry out this and other contracts. Only the three preliminary volumes of 'Peru' have been printed, but some separate publications have appeared, such as the description of the Department of Ancachs, which Henry Meiggs paid for. The map of Peru, on the scale of twenty-two centimetres to the degree, will consist of thirty-four sheets, of which eleven are published, two more are in the hands of the engravers, and the rest are all drawn.

Raimondi sold his collections to the Government for 50,000 soles (Peruvian dollars), on condition that they should belong to the School of Medicine. A museum was to be erected for these collections and named the "Museo Raimondi." The designs of the building have been approved, and the ground has been bought, but only the laboratory has been built. The School is now without sufficient funds to replace the fine library and anatomical collections which were destroyed by the Chilians, and hence is compelled to part with Raimondi's collections in order to provide for its more direct needs. These collections are now offered for the price at which Raimondi sold them.

Mr. Ernest Malinowski, the distinguished engineer of Peru, writes me that for these collections some years ago parties in the United States made offers which amounted to $100,000, besides agreeing to pay the expenses of publishing Raimondi's works. On account of a sentiment of exaggerated delicacy and of extreme modesty, Raimondi was reluctant to speak of these offers. For this reason, and as the papers of the deceased are now under seal, Mr. Malinowski does not know what parties made the offers. Prof. Louis Agassiz strongly urged Raimondi to come to the United States, and during the war with Chili the Italian Government invited him to go to Italy (his native land), and offered to take charge of the publication of the rest of his work. But Raimondi would not abandon Peru.

Concerning the collections, of which Raimondi left an inventory, Mr. Malinowski writes:

"I understand that the herbarium is classified and arranged in a series of books expressly ordered from France. The collection of 652 mineral specimens sent to the Paris Exposition of 1868 was returned, and is described [in *Los Minerales del Peru*, Lima, 1878]. There is also a large collection of minerals in boxes, each specimen properly labelled, and with the collection are given more than 4,000 analyses. Under the direction of Mr. [Louis] Agassiz, the fossils were classified by Mr. Gabb. The birds and some of the animals have been classified by Prof. [?], late Director of the Museum at Warsaw; the classification has been published."

I have asked Mr. Malinowski to send me a general description of the collections. Meantime I wish to call attention to the fact that these collections are for sale at what appears to be a very low price, and also that an opportunity is offered to make a valuable contribution to scientific knowledge. Should any parties wish to investigate the matter, it might be possible to obtain a report on the collections from the members of the Harvard Astronomical Expedition now in Peru.

"THE CANADIAN ELECTIONS."

To the Editor of The Nation:

Sir: As a Canadian subscriber to the *Nation*, I think it proper to point out to you, and through you to the readers of that journal, that the statements contained in the editorial item on the above subject, published in your issue of the 12th instant, are in great part, if not wholly, erroneous and misleading. In the first place, it is stated "that the elections have resulted in a practical defeat of Sir John Macdonald and the Conservative party." Now, so far from this being true, Sir John Macdonald's Government and the Conservative party have been sustained in their recent appeal to the people by a majority of 33 or 35, which is about as large as that they received at the last previous election in 1887. In the Provinces of British Columbia and Manitoba and the Northwest Territories, no change whatever has taken place in the comparative strength of the two political parties in the House of Commons, as the result of the recent election. In the Provinces of Nova Scotia, New Brunswick, and Prince Edward Island, the Conservative party has at the recent general election made a net gain of eight seats; while, as against this, it has in the other two Provinces of Ontario and Quebec made a net loss of not more than ten seats. These are the results of the election of 1891, as compared with those of the appeal to the people in 1887. Where, then, I would ask, is the practical defeat; and what, taking the Dominion as a whole, are the serious losses the Conservative party has sustained?

The other statements in the editorial in question as to the result of the elections showing the unpopularity of the Conservative protective policy; also, that the cry of "annexation" was raised by Sir John Macdonald to save this protective policy, and that the people of Canada had rebuked the Government party for contending that if unrestricted reciprocity were adopted, Canada would lose control of her tariff legislation—are of an equally mistaken and misleading character. I do not desire now to take up time and space by entering in detail into the discussion suggested by these statements, but merely to say, as to the "national policy," as our protective policy is called, that it was not condemned by the people of Canada, as shown by the result of the recent elections. The few counties which the Opposition gained in Ontario and Quebec on their policy of "unrestricted reciprocity" with the United States were frontier counties, and were so gained by reason of the immediate prejudicial effect upon the farmers in these constituencies, as they believed, of the high duties imposed under the McKinley tariff on such natural products as horses, hay, barley, eggs, etc., in which they were largely interested; and from the fact that the farmers were led to believe by the Opposition party that Sir John Macdonald was in some way responsible for the imposition of these high duties, and that only by getting unrestricted reciprocity, which the Opposition alone could obtain for the country, would it be possible to get rid of these objectionable duties.

As to the statement that "the cry of annexation" was raised by Sir John Macdonald to save the "national policy," such was not the case; but annexation to the United States was pointed out by him as the inevitable result, in his opinion, of a policy that would transfer the control of our customs tariff to the United States, and take away half of our annual revenue necessary to meet our annual expenditure. Whether the writer of the item in question believes so or not, there can be but little doubt in the mind of any one who has studied the question that the adoption by Canada of unrestricted reciprocity with the United States, as proposed by the Opposition party in Canada, must result in the first place in Canada losing control of her customs tariff, and in no long time thereafter in the absorption of Canada politically by the United States. Against these results Sir John Macdonald warned the people of Canada, and, acting upon his advice, instead of "rebuking" him, the electors by a large majority "rebuked" the Opposition leaders for embracing the unpatriotic policy of unrestricted reciprocity.

Considering that Sir John Macdonald's Government had already been in power continuously for over twelve years, and had been three times during these twelve years sustained on appeal to the people, and that they had against them, actively fighting them in this election, the whole force of the Provincial Governments of Ontario, Quebec, Nova Scotia, and Manitoba, and that such a plausible appeal was made to the farming community by the Opposition, the majority obtained by Sir John's Government is the strongest evidence possible of the soundness of his policy, and of the loyalty of the people of Canada to their own country, their Constitution, and their Queen.

A. Ferguson.

Ottawa, Canada, March 16, 1891.

A WOMAN IN OFFICE.

To the Editor of The Nation:

Sir: It will surely interest your readers outside of the State of Missouri to learn that here, in Jasper County, Mo., we have made a new departure in the distribution of county offices. While we have not as yet adopted woman suffrage pure and simple, we have established the eligibility of women for public office, by electing a lady to the important office of County Clerk at the election held last November. The distinguished example of our political tolerance is Mrs. Annie Baxter, who was nominated on the Democratic ticket for the office which she had previously managed as Deputy. It was a clear case of civil-service reform, advancing a worthy Deputy to the first place.

The nomination of a lady, owing to the novelty of the case, took a great many voters by surprise. The matter was privately and openly warmly discussed; there was no precedent. As to Mrs. Baxter's qualification, there was no dissenting voice, since she had acquired ample experience during several years' service as Deputy Clerk. Likewise all acknowledged her tact and the accommodating ways by which she had won numerous friends independent of party feelings. But was it opportune to jeopardize the chances of electing a Democrat to the office by paying a compliment to a lady Democrat? And could she hold office if elected? The latter question was decided in the affirmative by a carefully drawn opinion of leading lawyers, as had been done before when Mrs. Baxter was first appointed Deputy. At the election she was successful by a large majority; the Governor in due time signed her commission, and the defeated male candidate on the Republican ticket served notice of a contest, which will be decided in court next March.

The impending contest aroused the enthusiasm of the lady's supporters; the press of the State took up the case and decided the contest in advance of the court, bestowed the title of colonel on Mrs. Baxter, and heaped ridicule and scorn on the unfortunate Republican contesting candidate. The Democratic Mayor of a little town, in his enthusiasm, even registered one of his brood sows under the lady's name, erecting in this way to the liberal nominating convention a monument "ære perennius."

Curiously enough, the reason why the election of a woman for that office was deemed at least not opportune, was that in case bonds should be voted for the building of a court-house, the bonds countersigned by a lady Clerk might be looked upon as doubtful, and their placing on the market made difficult. Jasper County has had no court-house since the war, and all attempts so far to raise money for the building of one have failed because the farmers fight shy of bonds—for good reasons, with which I will not detain you.

A.

CONNECTION OF THE ENGLISH WASHINGTONS.

To the Editor of The Nation:

Sir: I notice, in Mr. Conway's letter on the early Washingtons in Virginia, the statement that the families of the name in Yorkshire and those in Northamptonshire existed in England for centuries separate and distinct, without any known link of kinship. I do not wish to dispute Mr. Conway's assertion; but, nevertheless, I think it well to remark that a connection between the two families is shown by the pedigrees given in Plantagenete-Harrison's 'History of Yorkshire'—how correctly I am unable to say.

The links are as follows: From Bonde, lord of Washington, in co. York *tempore* King Stephen, descended Robert Washington of co. Westmoreland, who had a descendant Robert Washington of co. Lancaster, whose descendant, Robert, founded the Northampton Washingtons from whom came our President, though not by Mr. Harrison's line, but by that discovered by Mr. Waters and corroborated by Mr. Conway.

March 21, 1891.

THE GREENES OF GREEN'S NORTON, ENGLAND.

To the Editor of The Nation:

Sir: In your issue of October 11, 1888, you published a "Simple Tale" from the pen of the late Dr. Beal, Rector of the parish of Green's Norton, telling of the fearful state of the monument and brasses belonging to the Greene family, and asking if any of the descendants who might be in America would be willing to help to put them in decent order; to which various members responded. I crave your kind permission to state that the restoration of the entire church is now commenced, for which the large sum of £2,600 is required, and to which the Queen has given £50. In the present state of our funds, we do not feel justified (much as we should wish it) in restoring the monument and brasses in such a manner as we should desire, unless we receive special donations for the purpose. The sum of £50 would do what is required, and I earnestly ask for that sum from those most interested in preserving their history and records of the past. I may add that already, in removing some plaster from the walls, various coats of arms of the Greene family have been found painted on the stonework as also on portions of the tomb.

Thanking you, in anticipation, for the insertion of this letter, in aid of a much needed work, and hoping that, through the wide cir-

culation of your paper, it may reach the eye of those it most concerns,

I am, sir, yours faithfully,

R. A. KENNAWAY, Rector.

GREEN'S NORTON, TOWCESTER, ENGLAND, March 16, 1891.

TALLEYRAND AND THERAMENES.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent last week, writing from Paris on the lately published memoirs of Talleyrand, recalled the words, in the declaration added to his will, that in all his political life he had abandoned none of the governments which he had served before it had abandoned itself. The newly discovered treatise on the 'Athenian State' affords a striking parallel in the judgment which Aristotle passes upon Theramenes. The ancient and the modern statesman each held office under three fundamentally different forms of government, and the modern was never more cordially hated by his opponents than the ancient, whose political nickname was the "Buskin"—the shoe that fits either foot. Talleyrand has spoken in his own behalf. Of Theramenes Aristotle (chap. xxviii) says:

"Men of more than superficial judgment do not believe that he was a professional destroyer of all governments, as his detractors say, but rather that he supported all as long as they did not outrage the law; for he was a man who could live under any form of government—and this is behaving like a good citizen—but who was the foe, not the tool, of governments that went beyond the laws."

M. H. M.

CAMBRIDGE, March 20, 1891.

Notes.

READERS of the *Atlantic* have already enjoyed a sample of the autobiography incorporated in the Life of James Freeman Clarke soon to be published by Houghton, Mifflin & Co. In this work the Rev. Samuel May, the Rev. Edward Everett Hale, and Mr. T. W. Higginson have been colaborers. The same firm announces 'Noto: An Unexplored Corner of Japan,' by Percival Lowell; and 'Whist in Diagrams,' by G. W. P.

D. Lothrop Co., Boston, have in press 'Christ Himself,' by the Rev. Alexander McKenzie; and 'Stories of the Land of Evangeline,' by Grace Dean McLeod.

Zola's new novel, 'Money,' is set down for issue this week in an English version by Benjamin R. Tucker, Boston.

G. P. Putnam's Sons have in preparation a translation of the 'Universal History of Literature' by Prof. Gustav Karpeles of the University of Prague, richly illustrated, in six parts, each complete in itself; and a 'Story of the Civil War,' 1860-1865,' by that eminent authority Mr. John Codman Ropes, in two duodecimo volumes, with maps and plans.

The spring list of Dodd, Mead & Co. includes 'Political and Social Letters of a Lady of the Eighteenth Century,' edited by Emily F. D. Osborn; 'Under the Trees and Elsewhere,' by Hamilton Wright Mabie; 'Francis Higginson (1587-1630),' by Thomas Wentworth Higginson, and 'Samuel Houston (1793-1862),' by Henry Bruce, in the "Makers of America" series; Landor's 'Citation of William Shakspere,' and Sainte-Beuve's 'Journal of Maurice de Guérin,' translated by Jessie P. Frothingham, in the "Giunta" series; 'Health without Medicine,' by Theodore H. Mead; and 'Sermons upon Faith, Hope, and Love,' by Prof. J. M. Hoppin of Yale.

Two volumes of short stories are nearly ready to be brought out by Charles Scribner's Sons, viz.: 'Zadoc Pine, and Other Stories,' by H. C. Bunner, and 'Gallegher, and Other Stories,' by Richard Harding Davis. This house will put on the American market Mr. Henry B. Wheatley's 'London, Past and Present,' in three volumes, whose arrangement is alphabetical.

Mr. C. G. Crump has edited for Macmillan Landor's 'Imaginary Conversations' in six volumes, whose appearance will begin in April. The text followed is that of 1876, with close comparison with that of earlier editions.

A 'History of the Press' has been undertaken by Mr. Henry Norman, and will bear the imprint of T. Fisher Unwin. The London *Times* will have a volume to itself, and the American press will have another among the several proposed.

The Knickerbocker Nuggets Series of the Messrs. Putnam is decidedly enriched by the two little volumes of 'Representative Irish Tales' compiled with an introduction and notes by W. B. Yeats. Here we have selections, many of them classic, from Miss Edgeworth, the Banims, Carleton, Lover, Maginn, Croker, Griffin, Lever, Kickham, and Miss Mulholland. Mr. Yeats's sententious introduction is a feeling characterization and criticism of the authors he passes in review. Ireland's poems and stories, he says, "came into existence to please nobody but the people of Ireland. Government did not make them on the one hand, nor bad seasons on the other. They are Ireland talking to herself." The Irish gentry "have never had a poet. Poetry needs a God, a cause, or a country." "It seems to be a pretty absolute law that the rich like reading about the poor, the poor about the rich. In Ireland, at any rate, they have liked doing so."

A late issue of "The Great Artists" series (Scribner & Welford) is devoted to 'The Landscape and Pastoral Painters of Holland,' to wit, Ruysdael, Hobbema, Cuyp, and Potter. It may fairly be recommended as giving in a handy form pretty much all the available information about these somewhat uninspiring artists, together with a sufficiently large selection of contradictory criticisms from various sources. The author, Mr. Frank Cundall, expresses few opinions of his own except the tolerably safe one that "a century hence Rousseau, at his best, will possibly be held a greater landscape-painter than Ruysdael; Troyon will be justly placed above Potter, and the pictures of Corot and Daubigny will be more highly thought of than those of Hobbema and Wijnants." If this is not true, it certainly ought to be.

We have received a new edition of the 'Histories' of Tacitus, by the Rev. W. A. Spooner of Oxford (Macmillan & Co.). The text is based upon that of Orelli and Meiser. The commentary is full, and of that excellent sort which makes suggestions to the student instead of loading him with lore or providing him with ready-made translations. Although it owes much to the labors of German scholars, yet it is the first English edition that has any just claim to originality. It is preceded by a long introduction on the state of the Empire and its history during the period of which the text treats. On the whole, we have here a most useful working edition.

Prof. Sonnenschein's critical and explanatory edition of the 'Rudens' of Plautus (Oxford: Clarendon Press; New York: Macmillan & Co.) is not only the first English edition of that play, but is the first Plautine work in preparing which the editor has had the advantage of using Studemund's *Apographon* of the Ambrosian MS. The text is conservative, the apparatus full, and the notes, while being thoroughly scholarly, are well fitted to serve as an introduction to the peculiarities of the idiom of Plautus. The volume is beautifully printed, being, in fact, quite the handsomest edition of a Plautine comedy that we have ever seen.

After ten years, Mr. Brander Matthews has brought out a new edition of his 'French Dramatists of the Nineteenth Century' (Charles Scribner's Sons), and has very properly added a chapter reviewing the state and tendencies of the French drama during the decade. The Romanticists have given way to the Naturalists, but whereas "the theatre was almost the first stronghold of the enemy captured by the Romanticists, strive as diligently as it can Naturalism has not yet found its dramatic formula." The dramatizations of Zola's, Daudet's, and Goncourt's novels have, for intrinsic reasons, as Mr. Matthews thinks, been comparative failures. In the period in question no first-rate dramatic talent has come to light, but fumbling and the unrewarded endeavor of a transition state have marked the years 1880-90. The Théâtre Libre is the one invention which seems to have some significance.

We have received a number of historical monographs for which the titles sufficiently speak to all who may be interested in them. The first is Mr. George M. Whipple's 'History of the Salem [Mass.] Light Infantry from 1805 to 1890,' published by the Essex Institute at Salem. In reprinting the original Articles, a facsimile of the title-page is given, and we remark on it a very ornamental rendering of the State arms, which deserves to find a new lease of life in some printing-office. From the author, whose address is No. 147 Benefit Street, Providence, R. I., we have a pamphlet, 'Ancestry of Calvin Guild, Margaret Taft, James Humphreys, and Rebecca Covell Martin, 1620-1890,' by Howard Redwood Guild, who prints but a limited edition. He has attempted to do justice to both the male and female lines, and gives references to his authorities. More than 100 surnames are involved, and there are two charts and an index. The field being Rhode Island, one may infer how many families are affected by these data, comprised within forty pages. Another pamphlet is an 'Account of the Reunion of the Descendants of Rev. Thomas Hooker, First Minister of Hartford, Conn.,' held at Hartford last May (Salem Press Publishing and Printing Co.). To it is appended an address by the Rev. Joseph H. Twichell, delivered in 1889 at the celebration of the 250th anniversary of the adoption of Connecticut's first Constitution—an instrument not at this moment so venerable as it appeared two years ago. Finally, we mention a reprint of the late Dr. Philip Slaughter's 'History of St. George's Parish in the County of Spotsylvania and Diocese of Virginia,' edited, with a biography and continuation, by Mr. R. A. Brock (Richmond: J. W. Randolph & English). This interesting work was published in 1847. A photograph of Dr. Slaughter's handsome and genial face serves as a frontispiece to the new edition.

We welcome the third volume of *Garden and Forest* for the past year (New York: *Garden and Forest* Publishing Co.), which, under Prof. Sargent's enlightened guidance, continues on its high level—its highest level, for it has no peer. It appeals, as mere literature, to every cultivated person, and it is full of information for the lover and grower of flowers and the amateur landscape-gardener. Its pictorial return alone to the subscriber is generous, embracing the novelties and the wonders of the vegetable kingdom.

The *Harvard Law Review* for March prints the prize essay of Mr. Charles E. Shattuck of the Boston bar, on the meaning of the term "liberty" in the clause of the Fourteenth Amendment (and elsewhere) relating to "life, liberty, and property." This is a valuable paper, and may be commended to our lawyers and judges as laying down sound principles for the interpretation of this important phrase. Some have forgotten that it has a history.

A new periodical has been added to those already published at the University of Michigan, called the *Inlander*. In the first number Prof. Henry C. Adams gives a review of the progress of political economy in the United States during the last ten years, showing the increased attention bestowed upon this subject in college courses, and referring to the numerous economic periodicals that have appeared of late years. It seems that the journals published at Harvard and Columbia have both become self-supporting, which is a conclusive proof of the public interest in the topics with which they deal. In the view taken by Mr. Adams, a considerable advance has been made by American economists in the direction of socialism, and he might have added that our legislators are beginning to understand the possibilities opened before them by this new political economy.

We lately had something to say of the new Oxford *Economic Review*. Macmillan & Co. now announce that they shall publish the *Economic Journal*, a quarterly magazine to be issued under the auspices of the British Economic Association, which has a considerable American membership.

Still another new venture in this line is the *Social Economist*, edited by Prof. George Gunton and Starr Hoyt Nichols, and published by the Institute of Social Economics at No. 126 East Twenty-third Street, New York. In the first number, for the current month, President Low of Columbia has a paper on "The University and the Workingman."

The March Proceedings of the Royal Geographical Society opens with a paper on the meteorological results of the *Challenger* expedition, by Mr. Alexander Buchan. These show among other things the greater velocity of the wind over the open sea than upon the land, "the mean difference being from four to five miles an hour." This difference is accounted for by the greater friction of the land, while other facts show, further, that "the heating of the surface of the land by the sun is in some way counteractive of friction." At sea, rain fell more frequently at night than during the day, and, of forty-five thunderstorms recorded, twenty-six occurred over the open sea, and all but four at night or in the early morning. Mr. Buchan believes the observations to prove that the surface currents of the ocean are in a very great degree determined by the direction and force of the prevailing winds. The paper is illustrated by four maps of the globe showing the isothermal and isobaric lines for January and July respectively, and two barometric maps of Scandinavia. Mr. G. F. Scott Elliot gives a discouraging report of the soil and vegetation of Madagascar, and Mr. W. B. Harris describes a trip from Fez to Wazan in North Morocco. He passed through one district which was uncultivated because "the place swarms with wild boar and sparrows, one of which uproots the grain, while the second destroy the ripening ear and leave not a particle."

Dr. Carl Peters's account of his expedition for the relief of Emin Pasha, published in the *Scottish Geographical Magazine* for March, is not pleasant reading. He started from the East Coast in July, 1889, with insufficient means to buy food or pay the regular caravan tribute to the natives, and accordingly was obliged to fight his way up the Tana River to the Victoria Nyanza. At one place, for the attempted theft of his mule and the plunder of one of his carriers, he had 600 head of their cattle driven from their pastures into his camp. At another place, on his refusal to pay tribute, the natives took from him "two tons of goods and had also thrown their spears." In retaliation he robbed them of 2,000 head of cattle, and, in the battle which ensued, killed nearly 150 men. It is difficult to see what he accomplished except to leave behind him a hatred for the white man which will long render abortive any efforts to civilize the natives. Mr. J. G. Bartholomew contributes the third of his singularly valuable papers on the "Mapping of the World." In this he gives a list of 700 maps of Asia, by far the greater part having been published within the past ten years. Out of a total area of 17,250,000 square miles, more than 3,000,000 have been topographically surveyed, while only 750,000 remain "unexplored country." This lies mostly in Tibet and Mongolia, though there is a large tract in Arabia and smaller ones in Persia, Siberia, and the East Indies. The accompanying map shows that the Russians have made a topographical survey of the whole route of the projected Siberian railway.

"W." writes to us from Johns Hopkins: "In a recent number of a Southern denominational organ, I saw an English grammar advertised as a Methodist text-book. Is not this an attempt at sectarian learning in line with the proposed denominational university at Washington?"

"B." writes to us from Cleveland: "Your correspondent who writes on the use of the word 'lad' in New England has evidently had little or no dealings with his Irish fellow-citizens. 'Lad' is the ordinary Irish-American term for 'boy' or 'fellow,' and is used generally by the Irish in Connecticut. To me there is no word which more definitely belongs to the Irish-American dialect, or more certainly marks it. The correspondent's boy friends have evidently come to use it by association with Irish boys. The word is Celtic, and the new 'Webster' gives the Irish cognate 'lath,' so its use among the Irish is natural enough. I speak of Connecticut as the part of New England I am most familiar with. I feel quite sure I have heard 'lad' used by the Irish in Boston, in Vermont, in Cleveland, and in fact wherever I have heard them talk."

—Prof. Freeman writes once more in the March *Macmillan's* on the side of the study of Greek. He is a practised controversialist, and puts life into his assault; he will not admit he is on the defensive, but makes a sort of brilliant sally into the ranks of the enemy. Keen in speech and never respectful of persons, he cannot be tedious to those he attacks, and he gives pleasure, which has perhaps a touch of malice in it, to those who would fain see the "ambitious pedagogue" (*i. e.*, head-masters) get his deserts. The grammar schools, Mr. Freeman says, exist for the universities, and not the universities for the grammar schools; and the study of Greek is to be considered from the university point of view—which is as much as to say that it is to be considered with respect to the question what is good for men, not what is good for boys. Greek, he thinks, is essential to culture, and by far the most useful of studies merely educationally and without regard to the place it may hold in after-reading. He writes mainly of the real place of both Greek and Latin in the history of the world—to lose them is to lose a large part of the past; and he asks whether Englishmen really wish to find Greek at Oxford on a plane with Arabic. It is a strong plea: to those who accept Mr. Freeman's axioms it is unanswerable; but, so far as can be judged, Greek is a losing cause, and is not likely to be saved by argument, however sound. The contest is really beyond argument, because it is a battle of different ideals; there is a lack of any common ground and standard to which appeal can be made with any certainty of the opponents understanding each other. And so in this case, too, it will happen that Mr. Freeman's weightiest words will fail of effect because "the ambitious pedagogue" and the *novus homo* of the sciences place no value on those elements of education which he thinks of most consequence, and have a very vague idea of what he is talking about. Such conflicts are not reasoned out, but fought out. It is in vain that literary men come up one by one and give their testimony that Greek is the one thing most needful, so far as their experience tests the matter. They are, after all, a small band, and their influence at the universities is inconsiderable. We find Mr. George Saintsbury, in the next article, contrasting English and French literature in his usual execrable style, but with thought and point enough; and he interrupts his praise of these two literatures as completing each other and making a whole in education, to say that he would not accept French in lieu of Greek and Latin, and again that he would not give up reading Greek and Latin on any consideration. The ranks of literature are very close in favor of the old culture, admitting only the need of more intelligent methods of teaching; but every year the universities yield more and more, and men of letters bred under the old régime have nothing to do with it except to make futile protests. Mr. Saintsbury's article, let us add, is well worth looking up by any one who would read an excellent broad-featured parallel of French and English genius.

—Many people every year, no doubt, read with surprise in their 'Robinson Crusoe' the account of the attack which wolves made upon his party as they were coming down the Pyrenees into France, and wonder a little that those wild beasts had not been exterminated at so late a date as a couple of hundred years ago. Such readers will find cause for still greater astonishment in an article which appeared in the *Revue Rose* of February 7, and which gives a good deal of curious information about the existence of wolves in France at the present day. No less than 315 of these animals were killed in the battues of the year 1889, the Exposition year. In several parts of the country they are a serious nuisance, killing sheep, destroying the little game that still exists, and even attacking human beings. General battues have been held twice a year, in March and in December, for two hundred years and more, under the direction of the lieutenants of *louveterie*. These officers are appointed by the chief of the State upon nomination by the Minister of Forestry, and, apart from their official character, seem to be much like English masters of the hounds. They are taken from the class of wealthy land-owners, keep up at their own cost an *équipage de chasse*, and serve without pay. In return they had, up to 1832, the right to hunt stags, boars, and hares twice a month in the State forests. This privilege is now restricted to the chase of wild boars only. Within the last ten years attempts have been

made to exterminate the wolves altogether. In 1882 rewards were offered of 200 francs for every wolf, male or female, known to have attacked a human being; 150 francs for each *louve pleine;* 100 francs for each *louve non pleine*, and 40 francs for each whelp. These rewards were paid in 1889 for 86 animals killed in Dordogne only, and 79 in Charente. In 1888 the numbers were: 100 in Dordogne, 56 in Charente, 53 in Haute-Vienne, 29 in Meuse, and 26 in the Vosges. The north of France, the centre, Normandy, and the basins of Paris and of the Rhone appear to be the only regions that are quite free from them. According to the writer in the *Revue Rose*, the last wolves were killed in Scotland in 1680 and in Ireland in 1710.

—The Year Book of the Holland Society of New York for 1888–'89 comes to us in a sumptuous octavo volume of two hundred and sixty-eight pages, bound in orange and decorated with the two red-white-and-blue flags of the Dutch and American republics. Printed at the De Vinne Press, and furnished with abundant tokens both of the printer's and illustrator's art, as well as of the loving care of the Secretary of the Holland Society, Mr. George W. Van Siclen, who is its editor, it is worthy of a place in the library as well as on the table. The first and major portion of the book is taken up with an account of a trip made by about fifty persons, members of the Society and their friends, to Holland during the summer of 1888. Besides a general description of the tour, there are bound up in the volume the maps, programmes, small guide-books, and catalogues of exhibitions specially prepared for their American guests by their hosts in Holland. The American pilgrims, returning to visit the homes of their ancestors, were everywhere received with unusual demonstrations of welcome. At Leyden the librarians and curators of that well-preserved city prepared an exhibition of documents, books, pictures, and relics from public and private collections relating to the Pilgrim Fathers and to the Dutch settlements in North America. These Dutch scholars of Leyden, though unable, despite their wide reading, to understand why the credit of settling America and of founding the nation is given chiefly to the Scrooby Separatists, nevertheless did their best to illustrate this part of the connection between Dutch and American history. There is an interesting paper on Jesse de Forest, the founder of New Amsterdam, which will interest New Yorkers. The papers of the historian, Rev. J. H. Suydam, especially that one relating to the finding of a portrait of Washington, are also of more than passing interest. In the latter portion of the book are given the speeches and proceedings of the dinner of the Holland Society in New York on January 8, 1889, and in Albany February 14 of the same year. Enriched with portraits and other illustrative matter, in addition to the winnowed text, the volume serves as a pleasing remembrancer of the ties between our country and the republic of northern Europe in which not only the Pilgrim Fathers, but nearly all the English Puritan leaders who settled in New England before 1640 A. D., received their political education. It serves, also, to refresh the memory of those who forget the great debt which the American owes to the Dutch republic, which, both to the colonists of the seventeenth century, the revolutionists of the eighteenth, and to the makers of the Constitution in 1787, was a living reality. The spirit of Bradford's words to the New Netherlands authorities in 1627 —"acknowledging ourselves tied in a strict obligation unto your country and State, for the good entertainment and free liberty which we had, and our brethren and countrymen yet there have and do enjoy, under your most honourable Lords and States"—was continued in Benjamin Franklin when, to the first Congress under the Constitution, he declared that "in the love of liberty, and bravery in the defence of it, she [Holland] has been our great example." We may add, by the way, that, after the adjournment of the International Congregational Council in London, July 12–21, the coming summer, a large number of Americans will proceed to Leyden to witness the unveiling of a tablet to the memory of John Robinson and his congregation.

—We have received a proof of the latest in the remarkable series of portraits on wood by G. Kruell from time to time commended in these columns—Abraham Lincoln. It is issued by F. Keppel, 20 East Sixteenth Street, who will also fill orders for the limited editions of the Darwins, Garrison, Phillips, Asa Gray, and Godkin, by the same engraver. The block is somewhat larger than its predecessors, measuring 8.5x10.5 inches, and reaches a limit of size which it can hardly be worth while to exceed for portraiture. This extraordinary print of Lincoln is, we do not hesitate to say, destined to be the historic likeness of the first President of our free republic. It is based upon the same photograph which Rajon etched in an unsatisfactory way a little before his death, and which St. Gaudens used in modelling the bust of the sculptured Lincoln—that at Chicago. But Mr. Kruell has also wrought into it the contemporary life-mask, and has invested the whole with that interpretation of character which distinguishes his portraits from those of any other artist. It is easy to say of the result that it will efface any portrait of Lincoln in black and white, hitherto produced, that may be placed beside it; but it is hard to describe in words the refinement and breadth of treatment, sureness of aim, harmony of modelling and of chiaroscuro, realism in the essential traits of physiognomy and legendary ideality of expression and sentiment, which nothing has yet approached. The quality of the portrait as a whole is not only masterly, but old-masterly; and as for the technique, it is a surprising advance even on the incomparable series enumerated above. It is a definitive challenge, by the head of the new school of American wood-engraving, to all other modes and schools of engraving to show cause why, in the estimation of connoisseurs and in commercial value, the most popular medium of pictorial art should not also be the most precious and the most sought after in its highest achievements.

VON SYBEL'S FOUNDING OF THE GERMAN EMPIRE.

The Founding of the German Empire by William I. By Heinrich von Sybel. Translated by M. L. Perrin, Ph.D. (Gött.), of Boston University, assisted by Gamaliel Bradford, jr. Vols. I., II. Thomas Y. Crowell & Co. 1891.

No more important historical work has appeared in the last decade than Von Sybel's 'Begründung des deutschen Reichs.' The movement which he describes ranks with the consolidation of the American Union and the establishment of Italian unity as one of the three greatest political achievements of our time; and his book is the first history of the German unity movement that is based throughout upon original material. The author received from Prince Bismarck, in 1881, permission to use the Prussian state papers for the purpose of writing this history, and since Droysen's death he has been the custodian of the Prussian archives. The Prussian collection includes the archives of Hanover, Electoral Hesse, and Nassau, seized in 1866, and these have enabled the historian to follow the movements of anti-Prussian diplomacy down to that date.

It is, of course, the Prussian side of the story that is here presented, and the narrative will eventually be supplemented, and perhaps in some degree corrected, by histories based upon the archives of Austria, France, and other European States. But the Prussian side will always be the most important, and it is not likely that Von Sybel's work will need to be done over again. When it was known that he was engaged upon this great task, there was but one feeling in Germany—that of satisfaction. Von Sybel won a cosmopolitan reputation in 1853, with the first volume of his 'Revolutionszeit,' and since the death of Ranke, as Kluckhohn said recently in the *Rundschau*, he has "incontestably occupied the place of honor" among German historians. The five volumes which have appeared, and which carry the narrative down to the close of the year 1866, have not disappointed expectation. From both the scientific and the literary point of view they rank among the best products of German historical genius.

The historian has striven to be just to Prussia's antagonists. "Nowhere in the book," he says in his preface, "have I attempted to deny my Prussian and National-Liberal convictions. I hope, however, for recognition of my endeavor to confess, without palliation, the faults committed and the mistakes made in our own camp; to judge justly and fairly the conduct of our adversaries; in other words, not to derive the motives of their action from folly or wickedness, but to comprehend them as the result of the historic premises of their entire position." (The translation is ours.) The practice of the author accords with this declaration of purpose. Frederick William IV. is not defended; Schwarzenberg, Rechberg, Napoleon III. are not assailed; the effort of the author is to discover the springs of their action, to comprehend them himself, and to explain them to the reader.

The period to be covered by the entire history is from 1848 to 1870 inclusive. The two volumes of the American translation which form the subject of the present notice, extend to 1863.

The author rightly judges that the triumphs of 1866 and 1870 cannot be understood without examining the failures of 1849 and 1850. To these again an historic introduction is necessary. Nearly a third of the first volume (book i.) is accordingly devoted to a sketch of the political development of Germany from the earliest times down to 1848. These chapters are written in the manner which Ranke has used so often and so effectively. The more remote history is given in the broadest outlines; the less remote with more detail; until, as the author approaches the period which he has undertaken to describe, the narrative becomes so full and complete that the reader passes almost insensibly from the preface to the body of the history. The keynote of the preface—and of the whole history, in fact—is struck at the end of the second chapter, where it is pointed out that the political situation of Germany, at the close of the eighteenth century, was dominated by the "dualism" between Austria and Prussia, while the political psychology of the German people exhibited a singular mixture of cosmo-

politan ideas and narrow State-rights sentiments. The next four chapters describe the Napoleonic supremacy and the War of Liberation; the unsatisfactory organization of the German Confederation in 1815; the attempt of Metternich to strengthen the Federal Diet in order more effectively to crush out revolutionary tendencies—an attempt which for the moment made the Liberals themselves State-rights men; the development of the Prussian Customs Union, which gave all Germany, outside of Austria, an economic unity; the rapid growth, in the forties, of a national sentiment; and, finally, a keen and striking analysis of the character and ideas of Frederick William IV. —next to Frederick the Great the most brilliant and, without exception, the most ineffective of Prussian Kings; a man who had every talent except the political, and was in sympathy with every age save that in which he lived.

Books ii. and iii. describe the attempt of the Liberals, whom the Revolution of 1848 had made, for the moment, masters of Germany, to establish a permanent national organization. The National Assembly was forced at length, by the logic of the situation, to vote the exclusion of Austria, and the consolidation of the "narrower Germany" into a democratic empire with a Prussian emperor; a result which a compact minority, headed by Von Gagern, had contemplated from the outset. Frederick William IV. refused the imperial crown, and the popular movement came to a speedy end. No previous writer has shown so clearly the cross-play, in the Frankfort Assembly, of national and particularistic sentiments, of conservative, liberal, and democratic ideas, of visionary enthusiasm and practical politics; but what is really new in this history is the exact statement of Frederick William's attitude towards the unity movement and of the considerations (or emotions) which determined his negative decision. It is in the midst of this period that we gain the first glimpse of the young Bismarck, encouraging the King (with a frankness of speech which shocked the Queen) to pluck up heart and resist the Revolution (vol i., page 286, translation). We learn also, for the first time, we think, that Bismarck was instrumental in securing the appointment of Count Brandenburg as Premier of a Conservative Ministry.

The contents of books iv. and v., in which the action centres at Berlin, may be said to be wholly new. These books describe the attempt of Prussia to establish the "narrower union" in concert with the princes of Germany; the collapse of this policy; the submission of Prussia to Austria at Olmütz, and the reëstablishment of the old Confederation. We have had, until now, only the external frame of these events; Von Sybel gives us the inside view. We follow every move in the diplomatic game; we sit in council with the Prussian King and his ministers; for the first time we understand Olmütz. One episode of this period was treated by Von Sybel some three years ago in an article entitled "Graf Brandenburg in Warschau," published in the *Historische Zeitschrift;* but all the rest of the story is new.

Book vi. covers the years from 1851 to 1857—years of comparative quiet in Germany, although Europe was agitated by the reëstablishment of the Napoleonic empire and the reopening of the Oriental question. Bismarck now begins to assume prominence in the narrative. His courage had impressed the irresolute Frederick William, his devotion to the royal prerogative had won the King's confidence; and when the Confederate Diet was reestablished at Frankfort, Bismarck soon became the Prussian representative in that body. During the Crimean War, all the chief threads of European intrigue ran through Frankfort, and Bismarck began to exercise a marked influence upon Prussia's general policy. His Frankfort despatches are therefore most valuable material for this period; but these despatches we have had for several years. They were published in 1882-84, with admirable introductions, which, we now learn, were written by Von Sybel himself.

Book vii. deals mainly with the period of the regency of Prince William, 1858–60 inclusive, and closes with his coronation in 1861. As Regent, William deemed it improper to break completely with his brother's policy, but his stronger character made itself felt at once, and Prussia's action became more decided and more consistent. The first steps were taken towards the reorganization of the army, in the face of growing opposition on the part of the Diet. As King, William pursued his aims with increased energy. The semi-Liberal Hohenzollern ministry, unwilling to face the conflict, resigned. In book viii. the historian describes the first year of Bismarck's premiership, 1862–63. The policy of "blood and iron" was announced, the "open place" in the Constitution was discovered, and the reserve powers of the Crown were brought into action. In the Polish insurrection, Bismarck sided resolutely with Russia against Austria and the western Powers. To Sir Andrew Buchanan, the English ambassador, Bismarck announced that, if the Russians were expelled from Poland, Prussia would herself occupy the kingdom. "Europe will never suffer that," said Sir Andrew. "Who is Europe?" inquired Bismarck. His attitude was dictated by the clear interests of Prussia. Russia had been on bad terms with Austria since the Crimean war, and the tension between these Powers was increased by Austria's hostile attitude in 1863. Prussia's support was doubly valuable at a time when Russia stood alone; it won Russia's gratitude and friendship, and the Russian support was of immense value in Bismarck's subsequent ventures.

The whole Polish question is more fully treated than Von Sybel's main object requires, but Poland has always been a favorite subject with this historian. Every student will remember his discussion and defence of the partition of Poland in his 'Revolutionszeit.' Now as then he is no friend of Poland, and his treatment of the insurrection of 1863 is extremely unsympathetic.

The second volume closes with Austria's theatrical attempt to solve the German question in the Austrian interest by a Congress of princes. Against his own judgment and inclination, King William held aloof from the Congress. The result vindicated Bismarck's foresight: the Austrian attempt came to nothing. In this same year, 1863, the Schleswig-Holstein question arose again, and Bismarck found his opportunity to solve the German problem. The Schleswig-Holstein question, the Danish war, the conflict between Austria and Prussia, and the formation of the North-German Confederation—these matters form the subject of Von Sybel's third, fourth, and fifth volumes, which we shall notice later, when the translation of these volumes is completed.

The translation of the first two volumes is anything but satisfactory. It is fluent, indeed, but not always idiomatic, and it is full of errors. Many of these are obviously due to carelessness. On page 8 of vol. i. we read that the German colonists of the Slavic East were "invited and favored by the rulers, who were themselves foreigners." Von Sybel says, "invited and favored by the foreign rulers themselves." In chap. iii. the author says that the first Napoleon became "the over-lord of *half* Europe." The translators make him say, "the master of *all* Europe" (p. 28). A little further along, the author tells us that the first North-German conspiracies against Napoleon had no "central point of guidance," but that the Prussian Government soon furnished such a central point. The translators say that there was no "central idea" in the movement until Prussia assumed its guidance (pp. 31, 32). A "central idea" of course existed all along—the liberation of the Fatherland. In addition to positive errors of this sort, there is a constant effacement in the translation of precise shades of meaning. This is the more unfortunate because Von Sybel is one of the most exact of historical writers. Every word of his is carefully weighed; nothing more is conveyed than the facts warrant; an important qualification is often contained in a seemingly unimportant adjective. Much of this is lost in the translation—and quite needlessly, for in most cases a literal rendering would preserve the sense without violence to English idioms.

There are many other errors, and graver errors, which are obviously due, not to the translators' carelessness, but to their ignorance of German history and German public law. On page 17 they tell us that, "by the quarrels of the Emperor Joseph II. and his mother during their co-regency, the dignity and unity of the imperial power were lost." Every student of Germany history knows that Maria Theresa was never co-regent of the Empire. Her husband was Emperor, and so was her son Joseph II.; by virtue of her husband's dignity, she bore the title of Empress; but in her own right she was only Queen of Bohemia and Hungary, Archduchess of Austria, etc. Referring to the German, we find that it was "die Central-regierung" of Austria, not the imperial power, that lost poise and unity through the co-regency.

Technical terms of politics and law regularly bring the translators to grief. On page 10 of volume i. we are told that, in the reign of Maximilian, "a number of imperial institutions . . . were brought into existence in the States." The German text makes the opposite statement, viz., that a number of "ständische Einrichtungen," *i. e.*, institutions created and controlled by the Estates, were brought into existence in the Empire. Among these was a "ständisches Reichsregiment," *i. e.*, a system of imperial administration conducted by the Estates; the translators make a wild shot at the word "regiment," and render the phrase "a State contingent of the Imperial Army." On pages 35, 64, and elsewhere, when mention is made of the plan of convoking "Reichsstände," or Estates-General, in Prussia, and of publishing a "Reichsverfassung," or general Constitution, for Prussia ("Reich" indicating simply the whole kingdom as against the separate provinces), the translators speak of an "imperial" legislature and an "imperial" constitution. The result is to confuse, in the reader's mind, the Prussian and the German movements; for the German patriots did desire an imperial constitution and an imperial Parliament. This objection seems, after a time, to have occurred to the translators, for on page 71 "Reichsstände" is translated by the single word "Estates"—which obliterates the very important distinction between the local or provincial estates then in existence and the proposed general estates—and on pages 73, 74, and 75 the same word is rendered "royal estates," which is meaningless. In still other parts of the volume the troublesome word

"Stände" is rendered by "constituencies," which confounds the representatives with their electors. And on page 46, "ständische Verfassung" and "ständische Rechte" are translated "provincial constitution" and "provincial rights," although the constitution and the rights in question were those of entire States and their inhabitants.

Almost any sort of a political division, from the early German "Gau" down to the "Landschaft" (and even, as in the case just cited, a State itself) is a "province." "Rechtspflege," the administration of justice, becomes "jurisprudence" (vol. i, p. 6). "Strafbare Rechtswidrigkeit," which means any punishable violation of law, is translated "State crime" (p. 15). "Rechtssicherheit" signifies security of civil rights: it is translated "constitutional rights" (p. 30). "Staatsrechtliche Streitigkeiten," constitutional controversies within a State, is rendered "differences between the States" (p. 46). "Schutz gegen Justizverweigerung," protection (by appeal) against denial of justice, is turned into the "right of public trial" (ibid). "Tax reform" is narrowed into "tariff reform"; "Anleihe," a loan, is translated (or misprinted) "law" (p. 71), and "Binnenzölle," or internal customs duties levied upon goods passing from one part of a State to another part, are twisted into "internal excise duties" (p. 74).

Perhaps the most extraordinary, certainly the most bewildering, freak of this translation is the rendition of "Particularismus," "Sonderthum," and similar expressions. In one passage (page 27) "partikulare Gesinnung" is translated "personal ideas"—which does not mislead the reader because it means nothing—but the word usually employed is "individualism." If "particularism," a word which is fairly acclimated already, is not good enough English for the translators, why do they not say "State sovereignty" or "State rights"? These are the American equivalents of particularism. Particularism and individualism are so far from being the same thing that particularism is frequently the bitterest enemy of individualism. So it was in the Augsburg peace of 1555, when each secular prince of the German Empire obtained the right of imposing his creed upon all the inhabitants of his territory. Nothing was then left to individualism in religion but the right of emigration. But this peace of Augsburg (which Von Sybel declares to have brought profit only to the "partikulare Gewalten") the translators calmly proclaim to have been "exclusively favorable to individualism" (page 12). This is like saying that the eleventh amendment to the United States Constitution, which makes it impossible for an individual to sue a State, is a triumph of "individualism."

It will not escape the careful reader that all our instances of mistranslation are taken from the first eighty pages of the first volume. What harvest might be reaped from the following thousand pages we do not undertake to say. A hasty examination of the last chapter of the second volume, however, has convinced us that the translators have learned something in the progress of their work. The errors are not so gross nor the infelicities so numerous. But in some cases they avoid error by refusing to translate technical terms at all, simply omitting them, which does not conduce to clearness.

Von Sybel's German publisher has protested that this translation is unauthorized. He characterizes the act of the American translators and the American publisher as "another illustration of the views prevailing in the United States concerning the literary property of foreign nations." It is conceivably in the power of the American publisher to remove the grievance of his German colleague; an injury to the pocket can be made good. But how are the gentlemen who have laid unlicensed hands upon the work of a foreign scholar, and who have defaced it, to make good the wrong that they have done to his reputation?

POLLOCK'S INTRODUCTION TO THE SCIENCE OF POLITICS.

An Introduction to the History of the Science of Politics. By Sir Frederick Pollock, Bart., Corpus Christi Professor of Jurisprudence in the University of Oxford. Macmillan & Co.

WITHIN the compass of one hundred and twenty-six pages, Sir F. Pollock has undertaken to sketch the history of one of the largest topics with which philosophers or historians have ever had to deal, and regarding the very nature and meaning of which many controversies have raged. It is no small praise to say that in writing so briefly on so vast a theme he has been neither commonplace nor superficial, but has given his readers matter well digested and of solid worth, touching often lightly, sometimes slightly, but never weakly, on the more salient aspects and problems that belong to what is called political science. After discussing the question whether the study of the State and its powers and functions deserves to be reckoned a science at all, he plunges into the history of the subject by an account of the views of Aristotle, whom he regards as the father of all subsequent political thinkers; laying, as we think, too little stress on the services of Plato, whose speculations, however far removed from the facts of human society, have at more than one epoch exercised a profoundly stimulating and moulding influence upon the minds of men. So far, however, as politics is a science, Aristotle is no doubt the thinker who did most to give it scientific form; and in some respects his views were more just and conformable to history as we now know it than those of any of his successors down to our own days. From Aristotle Sir F. Pollock leaps almost at once to Macchiavelli, giving a few passing words to Dante, and then presents us with a careful and exact, though of course very condensed, account of the speculations of Bodin, Hobbes, Locke, and Rousseau regarding the origin of civil society and the nature of political authority. To this account he adds remarks upon Montesquieu and Burke, who by their methods and tendencies belong rather to the historical than to the *a-priori* school. The last part deals with Bentham and Austin, as representing the English analytic school who approach political science from the point of view of utilitarian ethics, reviving the doctrines of Hobbes regarding the nature of the State; and with the German writers on the so-called Law of Nature who develop juristic and political notions out of ethical and metaphysical conceptions.

This brief outline shows how much has been omitted. There is hardly anything about mediæval doctrines, though these have considerable importance in the history of the subject; hardly anything about the relations of political philosophy to the political conditions of the civilized world during the last twenty-two centuries; nothing regarding the discussions which have filled so many minds and books regarding the merits of various forms of government and their administrative machinery, the rights of the citizen, the relations of the State to the Church and of States to one another. For these omissions our author is not to be blamed. He has wisely chosen rather to do some things thoroughly than many things in a sketchy and inadequate way. Many parts of the book, as, for instance, his remarks on Montesquieu and Burke, his reflections on the contrast between the English and the Continental points of view of jurisprudence and its relation to politics and ethics, are quite admirable in their terseness, their clearness, their unprejudiced good sense. No living writer in England or America, or, for the matter of that, in Germany or France, could have put his points better. Compare him, for instance, with Mr. Herbert Spencer, whom he sometimes quotes. Mr. Spencer's contributions to political and historical science seem to us mere commonplaces, sometimes false, sometimes true, but in both cases trying to disguise their essential flatness and commonness in a garb of dogmatic formalism. So John Austin, who is frequently referred to by Sir F. Pollock (though usually to be refuted) is one of the most barren and least penetrating authors whom the praises of friends ever pushed up into some sort of reputation. But Sir F. Pollock, with far less formal pomp than Mr. Spencer, far less dogmatic self-assertion than John Austin, has more to say that is worth hearing and pondering over than either of these writers.

The parts of the book which have chiefly interested us are the statement and criticism of the progress of doctrines from Bodin to Rousseau regarding the origin of civil society, and the view of the form which the fundamental problems of jurisprudence have assumed in our own time. It is not easy for us moderns who have been thoroughly imbued with the methods and temper of history to understand why Bodin and Hobbes should have labored so hard to find a foundation for the authority of the State. To us the problem is in one sense perfectly simple, in another perfectly insoluble. It is simple in so far as we understand how, in point of fact, civil society has been formed. We have had opportunities of observing communities in all degrees of civilization. We perceive that everywhere, even among Fuegians and Australian savages, there exists some kind of organization, however rudimentary, and that organization implies authority, and that authority tends, as communities advance for a certain time, to become more stringent and more concentrated until some sort of State with a recognized government is constituted, the powers of such authority becoming more and more defined, first by custom and ultimately by law. We see no occasion for any such theory as that of the original compact, or *contrat social*, to explain the phenomena of the growth of States out of families and tribes, even if we could suppose that the formation of such covenants was the sort of thing primitive man was likely to do. As regards the nature and ground of the authority of the State over the individual, we should now say, in the first place, that something of the kind is to be expected, because, as Aristotle observed long ago, ἄνθρωπος φύσει πολιτικὸν ζῷον—man is by his own nature a being fitted for civil life. Every man is born into communities which he finds already subsisting, and he can neither ignore them nor be ignored by them. That their rules should bind him is a necessity of the case, which he can escape only by betaking himself to a desert island. All this seems now obvious. If the inquirer, however, is not satisfied with historical explanations, and insists on having some ground of abstract reason given why men should be required to obey other men, apart from the fact that the world has practically

proceeded on the hypothesis that they must so obey, it is not easy to find any such ground, for an appeal to physical force rather cuts than unties the knot. And if he goes on to ask what are the tests by which a just government may be distinguished from an unjust one, so that the citizen shall know when he ought to obey and when he may properly rebel, we shall answer that there exists no such general test, and that it depends on the circumstances of each particular case whether insurrection is a crime, or a right, or a duty. These, however, were the questions on which some of the most powerful intellects of the sixteenth, seventeenth, and eighteenth centuries were occupied, and which more than once passed from the study of the philosopher to become the theme of hot debate in assemblies, or the motive force of political parties.

Two reasons may, we think, be assigned for the importance attached to them. One is the fact that when the power of the Roman Church and of what may be called the religious theory of civil government—that which represented Pope, Emperor, and King as divinely commissioned authorities—fell and vanished, men felt the necessity of putting some other formal and imposing theory in its place, and were not content with the simple explanation or denial of any mystery in the matter which now satisfies us. The other is, that the difference between legal authority and moral authority, between that which the ruler has a legal title to do and that which he ought to or may in conscience do, had not been fully apprehended, and men sought for a doctrine which would explain and bring into accord phenomena which we regard as lying, so to speak, in different planes. Some such confusion seems to lurk in the systems both of Hobbes and of Rousseau. Locke and the English statesmen of the Revolution were on ground somewhat more stable and real; for though the commonwealth of England was not built upon any original compact of its members with one another, there might be said to be a sort of contract between the Crown and its subjects, the obedience of the latter being conditional on the observance by the former of his coronation oath and of the engagements entered into by his predecessors from the great charter downwards. It is to be hoped that this question of the nature of sovereignty, which has haunted politics like a gibbering and unsubstantial ghost for centuries, and still lingers in the belated treatises of Austin and the other followers of Bentham, has now at length been laid to rest and will trouble us no more.

The other topic which has specially interested us, as handled by Sir F. Pollock, is the modern German school of writers on what is called *Naturrecht*, including such men as Röder, Trendelenburg, Ahrens. He says just the right thing about it, viz.: that it is not so empty and vague as English lawyers, and even perhaps most English jurists, commonly assume, but that it has not a practical value for the purposes of legal study quite commensurate to its high pretensions and to the fulness with which German professors treat it. Its province is the borderland between ethics on the one hand and law or political science on the other. It examines the conceptions and relations which belong to this borderland with much acuteness, and in so far lays a foundation for legal study which is not to be despised. It is at least as much to the purpose as the lucubrations on the principle of utility to be found in Bentham or Austin, and has the advantage of presenting a somewhat wider view of the scope and organs of law than that of those who seem unable to imagine any form of legal rule other than an English Act of Parliament. But, it must be admitted, the method of these books on Natural Law is so very abstract, and the labor of reading them so disproportionate to the crop of ideas which one can raise from them, that few Englishmen or Americans are likely to spend, or can be advised to spend, time upon them. Sir F. Pollock, indeed, thinks that "the bent of American publicists is towards the Continental habit of thought. They believe in the Common Law, like English judges of the seventeenth century, and in the Law of Nature, like German philosophers." It is true that some eminent professors in our law schools refuse to teach the law of their own State merely, preferring to handle the law as common to the United States generally. But we do not believe that there is more tendency in this country than in England to the German way of regarding jurisprudence in general. It is almost the only point—and certainly not a grave one—in which we differ from our author, whose book is one of quite exceptional merit.

The Adventures of Thomas Pellow of Penryn. [Adventure Series.] London: T. Fisher Unwin; New York: Macmillan & Co.

THIS curious book was first published in 1740, two years after the author's return from his twenty-three years' captivity among the Moors. Dr. Robert Brown has written an interesting introduction and a number of notes elucidating the text, but otherwise the book is a reprint of the original edition, except that some passages stolen from other authors have been omitted. Until recently the value of Pellow's narrative as a contribution to the very slender stock of knowledge of Morocco has been overlooked, but investigation has confirmed its general accuracy both as regards topographical and historical statements. The country is little known to-day, and was less known in the last century, and it is therefore not surprising that some of the wonderful things here recorded should have led his readers to doubt Pellow's truthfulness.

The most plausible account of the origin of the Barbary pirates is that when the Moors were driven out of Spain, they took their revenge by preying on the commerce of the Christians; but there is good authority for the theory that they received their earliest lessons in seamanship from the privateers who had won both glory and profit in Queen Elizabeth's time, and found themselves out of work in the following reign. Certain it is that Capt. John Smith of Virginian fame was for a time in the service of the Sultan of Morocco, and that many of the Moorish leaders, both on land and sea, were European outcasts. In Pellow's time the Governor of Sallee was a Frenchman named Pillet, and as late as 1780 a Scotchman known as "Omar" commanded a piratical craft, and it is safe to assume that both these gentlemen had "left their country for their country's good." The Europeans who were captured in merchantmen and refused to adopt the Moorish religion and dress, were cruelly treated and kept at hard labor on buildings and other public works. The Emperor Muley Ismaïl, who reigned from 1672 to 1727, when remonstrated with for cruelty towards Christian captives, replied that he was like a man with a bag of rats, and must keep them stirring, or they would eat their way through! On the other hand, those who "turned Moor," as Pellow and others did, found pleasanter employment, and were sometimes raised to important commands in the army. Muley Ismaïl's executioner, who was remarkably skilful in cutting off heads with one blow of the sword, was an Exeter man, and owed his success in life to his early training as a butcher. Many of these apostates were presented with wives by the Emperor, and their fair-haired descendants are pointed out to the traveller in Fez and Mequinez to this day.

It was in 1715, when he was eleven years old, that Thomas Pellow, "being at the Latin School in Penryn, and by no means liking my so early rising, and (as I then thought) most severe discipline of the school," persuaded his uncle to take him along with him on the good ship *Francis* bound for Genoa. The *Francis* was captured off Cape Finisterre by two Sallee rovers, and the crew, together with captives from other vessels, were marched from Sallee to Mequinez, and there put to work and subjected to much cruel treatment. The Emperor, however, seems to have taken a fancy to Pellow, who was persuaded to "turn Moor," and, having done so, was better treated and set to learn Arabic. At the time of Commodore Stewart's embassy for the redemption of British captives in 1721 he seems to have acted as interpreter, and he says that he could tell many things of moment about this embassy; "but as I am informed there is a book of it already printed, I shall not go about in anywise to interfere with it." This scrupulous non-interference is no longer characteristic of African travellers. Again, in 1727, Capt. Russel went on a similar embassy, and mentions having met Pellow, "a young fellow of good family in Cornwall, but now turned Moor." These embassies resulted in the liberation of some of the English captives, but the cases of Pellow and the other renegades were not deemed worthy of their consideration.

As time went on, Pellow showed courage in the field and some military talent, and was appointed to the command of a considerable body of horse. The Emperor gave him a wife with whom he seems to have lived happily in the brief intervals between different campaigns; but the ardor of his affection was kept well in hand, for when, at a later period, he was informed of the sudden death of his wife and a little daughter, he says: "I thought them to have been far better off than they could have been in this troublesome world, and therefore it gave me very little uneasiness"! In the course of his endless marches about the country, he was often wounded, and still oftener in danger from lions and other wild beasts. He says that if a man meets a lion, he should stare him full in the face and loudly abuse him in the language of the country ("for fear he may not understand English"), and that if he is so treated, he will generally decamp. It is a singular proof of Pellow's truthfulness that these tactics are exactly those employed by the Moors of to-day, though lions are no longer as numerous as they used to be.

In spite of his military success, Pellow became weary of the continual civil war that followed the death of Muley Ismaïl. That venerable ruffian is said by one authority to have left 900 sons; and even if we prefer another historian who reduces the number to 520, there would still remain a substantial basis for these wars of succession. During all this period Pellow's thoughts were constantly bent on efforts to escape. Twice he was unsuccessful and came near losing his life in consequence. On one of these occasions he and a comrade, by deliberate perjury, turned the tables on a third Englishman, who at first shared and afterwards betrayed their plot; and he naïvely describes his embarrassment on meeting this unhappy Englishman's sister after his return to

England, but decides that he was justified by the facts. The story of his third and last attempt is crowded with the most thrilling and dramatic incidents. As one misfortune after another befalls him, it seems impossible that he should succeed; but pertinacity and nerve carry him through the slough of despond, and finally, in the year of grace 1738, "the so long lost sheep is again restored to his owners after his long straying and grievous hardships amongst those monsters and ravenous wolves of infidelity." With such pious phrases does the good man eke out his somewhat lean store of moral rectitude.

A. M. Mackay, Pioneer Missionary of the Church Missionary Society to Uganda. By his sister. With portrait and map. [Author's Edition.] A. C. Armstrong & Son. 1890. 8vo, pp. viii., 488.

"THE best missionary since Livingstone," is Mr. Stanley's estimate of the subject of this biography. This testimony, which all who knew Mackay and his work will heartily endorse, is significant as showing the qualities and training which insure the greatest success in savage Africa. He was in many respects a singularly interesting character. A skilful civil engineer, with a university education, but thoroughly imbued with the straitest Scotch theology, he burned with a zeal to convert the heathen, and at the same time held the steam-engine only second to the Bible as a civilizing agent. Road-making, boat-building, work at his forge, were for him inseparable adjuncts to the preaching of the Gospel. There was, from his point of view, no opposition in religion and science, but the one was essential to the other in Christianizing the black man. One secret of his success, it should be added, was the rare faculty that he had of attaching the natives to him. This is the more noteworthy, as he confesses to having had "an almost uncontrollable aversion" to black people. Not only did he fully overcome this, but one of his associates says of him that his love for his black converts was very touching. Perhaps none but Livingstone and Stanley have ever gained so great an influence over the African. "For many days before we reached his mission," says Mr. Jephson, "we heard from the natives of Mackay, nothing but Mackay—they seemed to care for and know of no one else." Gen. Gordon early recognized his peculiar ability and traits, and offered him a high position in his service, which the young man, intent only on missionary work, declined.

The story of his short life is quickly told. He was born in 1849 in a Scotch parsonage, studied at Edinburgh, and, after leaving the University, was employed for three years in Germany as a draughtsman of machinery. During a part of this time he spent his evenings in translating Lübsen's 'Differential and Integral Calculus,' and in "inventing an agricultural machine which obtained the first prize at the exhibition of steam machines held at Breslau." In 1874 he offered himself for missionary work in Madagascar, with the hope of establishing a college "to train the young men in religion and science together," and the expectation of executing public works, such as railways, mines, etc. The time, however, was not ripe for ambitious enterprises like these, and his offer was declined.

Notwithstanding this check, his purpose remained unchanged, and in 1876 he was accepted for service in the Uganda mission, being one of the eight pioneers sent out in response to King Mtesa's invitation given through Mr. Stanley. From various causes he was prevented from reaching this country for more than two years after landing at Zanzibar, the interval being mainly employed in building a road and forwarding caravans and supplies from the coast to the Victoria Nyanza. His work in Uganda extended over eight troubled years, his chief antagonists being the Arabs and the witch-doctors. Driven out by Mwanga during his frightful persecution of the Christians in 1887, he retired to the southern end of the lake, where he built a new station. Here for two years more he kept at his task of giving a Christian civilization to the negro, steadfastly refusing to heed the earnest entreaties from friends and employers to return home and recruit his exhausted strength. The end came suddenly through an attack of fever on February 8, 1890.

Mr. Stanley's description of the station, as seen by him a few months before Mackay's death, gives a good idea of the industrial side of his work. "There was a big, solid workshop in the yard, filled with machinery and tools, a launch's boiler was being prepared by the blacksmiths, a big canoe was outside repairing; there were saw-pits and large logs of hard timber," and many quiet laborers. In addition to occupations such as these, he was an indefatigable teacher, and not only reduced the vernacular of Uganda to writing, but also translated and printed portions of the Bible in this language from types of his own make.

It is difficult from his sister's account to get a true impression of what Mr. Mackay was and what he accomplished. She has evidently been hampered in two ways, by her desire to write a biography of the old-fashioned kind which should be edifying, and by her belief that the history of the Uganda Mission is generally known. Accordingly, a large part of the book is given up to long and, we are bound to say, often tedious extracts from her brother's diaries and letters, while important events are only briefly referred to or altogether omitted. References to the natives and their customs and to the country and its varied life are far too few for the interest of the biography. We regret this especially because Mr. Mackay's career contained more that would stimulate young men to self-sacrificing lives than that of any missionary of our day. He was the true type of man that Africa most needs.

Socialism, New and Old. By William Graham, M.A., Professor of Political Economy and Jurisprudence, Queen's College, Belfast. [International Scientific Series.] D. Appleton & Co. 1891.

THE plan of this book is praiseworthy. Prof. Graham first considers socialism historically, with a view to showing that in its essence it is no new thing, that it is always produced by like causes, and that in the form of communism it is obsolete. After a summary view of the earlier socialism, he examines at length the great modern systems, represented by Rousseau, St.-Simon, and Marx, pointing out in detail the strong as well as the weak features of each. His array of objections is formidable and apparently conclusive, but sincere Socialists, we apprehend, will not be crushed by them. Their strength is elsewhere than in their logic, and Prof. Graham might well recall the exclamation of Burke: "I am most afraid of the weakest reasonings, because they discover the strongest passions."

After having demolished the main positions of modern socialism, Prof. Graham tries his hand at a little constructive work in the socialistic line. He decides, without thinking it worth while to offer proof, that capitalists get larger profits than is fair, and laborers lower wages than is just. This is half the battle, and it is no more difficult to assume the remainder of his case, viz., that his expedients would result in more equitable division of material wealth than at present takes place. Co-operative production has failed hitherto; it has failed when aided by the State; but still we cannot be sure that it may not succeed better in the future than the past, and we ought to experiment further with State aid. Then all the professions, the best places in the public service and in business, are now monopolized by the educated classes, and this monopoly would be broken down by nationalizing existing public educational funds so that all may have an equal share in them. The money necessary for these reforms is to be supplied by taxing inheritances.

Prof. Graham further assumes that Government now works successfully, from the economical point of view, the postal and telegraph services. He would do well to read two of Jevons's essays, one written before, the other after, the acquisition of the telegraphs by the British Government. Prof. Graham again declares that the management of railways is work "not demanding from the general managers the complicated calculations and resources required in manufacturing industry, and for which work, however responsible or difficult, the Government could secure as capable managers as the companies." This proposition may be commended to the directors, say, of the Pennsylvania Railroad. It is certainly doubtful if such a body as the New York Legislature, or even the American Congress, would manage our railroad system with satisfactory results. But it might be otherwise in Prof. Graham's commonwealth, for he lays it down that "the officials under Socialism would be the most capable in the nation."

As to the wages-fund theory, Prof. Graham considers that it is entirely exploded. Singularly enough, when he undertakes to state what determines the rate of wages, he declares that it depends chiefly upon the ratio between the number of laborers and the demand, the "amount of need" for their services. Unless this is intended to express the absurdity of a ratio between a number and an abstraction, it must mean that the "amount of need" is measured in material quantity. As to the explosion of the wages-fund theory, which so many writers upon these subjects regard as unquestioned, it may be worth while to say that the essential element in that theory is simply the truth that wages paid for any piece of work are necessarily paid out of wealth produced before that work is done. In other words, the laborer's subsistence must be provided beforehand in order that he may work—a theory which will perhaps be exploded when the theory of gravity is abandoned.

As we should expect, Prof. Graham attributes the improvement in the condition of working-people in England to the Government inspectors. Had it not been for them,

"we should have a proletariat of servile workers, degraded in physique, in mind, in morals; mothers working in mines and factories, their sickly children dying without a mother's care, or surviving with enfeebled frames; other children ignorant and savage, worked to death or growing up savages; the whole laboring population turned into mere human plant and instruments to make the fortunes of masters constantly becoming more insolent and inhuman from impunity. We should have had the 'slave-gangs' of the Roman Republic repeated," etc.

We commend these views to the consideration of the protectionists who have been annoyed

by persistent assertions that the improved condition of the working-classes in England was due to free trade.

Obviously Prof. Graham is not a person to shrink from drawing an indictment against a whole nation. The rich as a class, whether intentionally or not, have injured the poor, and as a class they must disgorge some of their wealth. They must do it because it is just, of course, but they will have to do it, whether or no. If they are wise, they will submit to a moderate amercement at once, because the craving for "justice" among the poor may become so strong if it is not gratified in this way, that nothing less than general confiscation will satisfy their consciences. Like the children of Israel, they will feel that the despoiling of their masters shall be counted to them for righteousness by the Almighty. Perhaps a later comparison would be more fitting, for Prof. Graham soberly declares that a city where pauperism was stamped out would be "the true Holy City, and the Kingdom of Heaven will have come nigh unto it.' Clearly the Mohammedan paradise is before us, with material gratifications unthought of by the Prophet.

It is strange that writers of this stamp, whose name is legion, should so completely ignore the enormous extent to which laborers have become capitalists. Their savings constitute an important element in almost all modern enterprises, and schemes directed against "the capitalist" in the abstract inevitably recoil against the laborer in the concrete. We must, of course, credit the victims of the modern socialistic craze with sincerity in their plans for enriching the poor by impoverishing the rich, but their view is mysteriously limited. In the case of the present writer, while we are unable to put a high estimate upon his wisdom, we may at least say that his tone is comparatively moderate, and many of his observations judicious. His remarks upon the probable increase of selfishness in the modern world are especially suggestive.

Eclectic Card Catalog Rules, Author and Title Entries; based on Dziatzko's 'Instruction' compared with other authorities. By Klas August Linderfelt. Boston: Charles A. Cutter. 1890. Pp. viii, 104. 8vo.

While Prof. Carl Dziatzko, now of Göttingen, was Librarian of the University of Breslau, he caused to be made, as a complement to the classified-subject catalogue which the library already possessed, an alphabetical card catalogue of authors. During the process of cataloguing, more than 330,000 volumes, with the corresponding cards, passed for inspection through his hands, and on the wide experience thus gained he based his 'Instruction für die Ordnung der Titel im alphabetischen Zettelkatalog der Königlichen und Universitäts-Bibliothek zu Breslau' (Berlin: Asher, 1886). These rules Mr. Linderfelt justly describes as "a model of ingenious condensation, lucidity, and completeness. It would have been impossible to evolve out of mere theoretical reasoning such an array of minute directions as to the manner of proceeding in the innumerable variations and peculiarities of book-making, which are the result of the vagaries of authors, publishers, and printers of the last 450 years, and now contribute their share towards making the life of the conscientious cataloger a burden." Mr. Linderfelt's book, which is rather an adaptation than a translation of Dziatzko's, preserves the general spirit and intricate, but economical, schematism of the original, while it so modifies individual rules as to conform them to prevalent American methods of cataloguing. In addition, Mr. Linderfelt has examined the rules of the British Museum and the Bodleian Libraries, of the American and the British Library Associations, of Cutter, Dewey, Jewett, and Perkins, and has noted at each point which of these authorities do, and which do not, agree with the "eclectic" rules.

The title which Mr. Linderfelt has chosen is more attractive than Prof. Dziatzko's, but by no means so accurate. The 'Eclectic Card Catalog Rules' are not catalogue rules at all. From them the would-be cataloguer can infer, no doubt, that books of known authorship sometimes have titles, but whether or not the titles should form any part of his catalogue he cannot even infer. Place of publication, date of issue, size, number of pages, will not be mentioned in it—at least they are not mentioned in the rules. In short, the most intelligent use of these rules would not enable a person without previous knowledge of cataloguing to catalogue the simplest book. The 'Eclectic Rules' take for granted that a complete description of the book in question—title, edition, imprint, contents, and notes—is already at hand; they then point out how to choose from this material the heading or rubric ("entry word," Mr. Linderfelt well calls it) under which the description is to appear, how to alphabetize the rubrics chosen, how to make some cross-references. These three accomplishments are far from being all there is of book-cataloguing. Still, they are an important part of it, and Mr. Linderfelt's treatment of them is the most careful and rational that we have seen.

The 'Eclectic Rules,' of course, are in general similar to those of the 'Instruction,' but not always identical with them. Prof. Dziatzko, in common with other German bibliographers, chooses the first substantive not in a grammatically subordinate position as entry word for an anonymous book-title—he enters the *Saturday Review*, for example, under "Review." Moreover, he considers the publications of learned academies and societies anonymous: he enters the volumes published by the Chetham Society under "Remains historical and literary connected with the Palatine Counties." Mr. Linderfelt has so shaped his rules as to secure entry, in the cases mentioned, under "Saturday" and "Chetham." He was, consequently, obliged to attempt a solution of the vexed question, How shall societies and academies be entered? He adopted the fifth, and best, of the plans mentioned in Cutter's 'Rules for a Dictionary Catalogue,' making but one change, and no improvement, therein. According to the 'Eclectic Rules,' "when the legal name of an institution includes a full personal name, it is entered in the usual order of the name, as *Enoch* Pratt Free Library, with a cross-reference under Pratt." "The usual order of the name" has a plausible sound, but Mr. Linderfelt seems momentarily to have forgotten a fact which Mr. Cutter realizes, viz., that in a catalogue "the usual order of the name" is the inverted order. The cataloguer should write "Pratt (Enoch) Free Library."

One other alteration, this time of the German rules, does not seem to us fortunate. It advises that when a book is published under initials whose meaning remains unknown, the rubric be the last initial instead of the first word of the title. This suggestion, though supported by the practice of many good libraries, both in the United States and in England, is an extreme and unwarranted application of the author-entry idea. In fact, a chief weakness of American book-cataloguing has long been the tendency, now happily vanishing from the treatment of anonymous and pseudonymous books, to seize, at whatever inconvenience to the reader, upon an author-entry or anything that resembles an author-entry. Now, the sole object of cataloguing a book under its author, or under anything else, is to facilitate the finding of it. Mr. Linderfelt himself admits that Prof. Dziatzko is right in considering the initials "of very little use in finding a certain book," but gives another reason for entering under them. This plan, he says, "has the advantage of collecting all the books by one author in the same place when he persistently uses the same initials." What may be this "advantage of collecting all the books by the same author in one place" when you are not sure who he is, and consequently cannot be sure that he is the same author, we are puzzled to understand. However, a few blemishes like these cannot hide the real excellence of the book. In its first half, the part, that is, which explains the selection of the main entry word, almost every paragraph, with the exception of the rules above mentioned, is deserving of praise.

To the second half of the rules, the instructions for the alphabetical arrangement of the titles, almost no exception can be taken. They are minute and excellent. Substantially the system of transliteration advocated in these columns by the late Michael Heilprin and approved at the Lake George Conference of the Library Association, is adopted in the 'Eclectic Rules.' "For the purpose of producing transliterated forms more in harmony with those in ordinary use," Mr. Linderfelt has introduced a few modifications, most of which, unfortunately, look towards the forms that were familiar in the last decade, rather than towards those which bid fair to be familiar in the next. For ancient Greek names, on the other hand, he prefers the newly advocated "Greek forms" (Aischylos, Kimôn) instead of the familiar Latin forms, and similarly he writes names of foreign towns and sovereigns in their vernacular instead of their English forms. The rules are followed by an appendix containing a list of Oriental titles and occupations, with their usual and their correct transliterations, and their significations. This list, which contains more than 600 titles, will be very useful to cataloguers who are ignorant of Oriental languages and consequently apt to mistake such titles for parts of the author's name.

The 'Rules' are accurately printed, the examples are abundant and in general well chosen, and the index is much fuller than that of the German original. In a fairly close examination of the book we have discovered but one joke (§ 174): "It may be stated on the authority of R. B. Wheatley, that dissertation, disputatio, thesis, etc. [!], are generally used synonymously."

Kleinere Schriften, gedruckte und ungedruckte, von Joh. Jos. Ign. v. Döllinger. Gesammelt und herausgegeben von F. H. Reusch. Stuttgart: J. G. Cotta. 1890. Pp. vi., 608.

The contents of this stout octavo volume consist of addresses delivered and articles written from 1848 to 1853, and again from 1863 to 1878, and cover two important periods of the author's literary activity and intellectual development. The topics discussed in the papers belonging to the earlier period are such as then constituted the burning questions of the day, and refer chiefly to the relations of Church and State, which, Dr. Döllinger maintained, should be wholly independent of each other. As a mem-

ber of the Frankfort Parliament of 1848, he urged this view with eloquence and earnestness, and endeavored to embody it in national legislation. He heartily endorsed the article in the proposed German Constitution which secured to every citizen perfect freedom of religious opinion and worship, and placed all churches and confessions in a position of complete equality before the law; but he deemed the independence of Church and State absolutely essential to the full effectuation of this principle of liberty, and his pamphlet on this subject, published anonymously in August, 1848, forms the initial paper of the present volume. It is also interesting to note his opinions incidentally expressed in this connection concerning the office and power of the Pope within the hierarchy. Döllinger denied that the head of the Church was, in any proper sense of the term, sovereign, or that his authority had ever been regarded as absolute or infallible. He declared that in no State on earth, except perhaps in China, is the supreme ruler subject to so many strict limitations and legal conditions in the exercise of his functions as in the Catholic Church; indeed, so completely is he hemmed in on all sides by precedents, traditions, and the decrees of councils, and so little room is there left for the assertion of personal sentiments, that any one familiar with canon law and Catholic theology can predict with certainty, in forty-nine cases out of fifty, precisely what the Pope's decision will be. This was Döllinger's firm conviction, repeatedly uttered and emphasized, and shows how impossible it was for him to accept the Vatican dogma of 1870 and to preserve his self-consistency and self-respect as a man and a scholar.

The proclamation of the doctrine of the Immaculate Conception in 1854, and the issue of the encyclical letter of 1864, with its notorious syllabus, ought to have opened his eyes to the direction in which the tide was setting and the ark of the Church was drifting. That he saw the danger is evident from the paper entitled "Die Speyerische Seminarfrage und der Syllabus," written in January, 1866, and now first printed from the original manuscript. Here he perceives and defines very clearly the aims of Ultramontanism, which were to make the Pope the supreme, infallible, and, therefore, sole authority in all that pertains, not only to religion and the Church, but also to the State, science, politics, morals, social conditions—in short, the whole intellectual life of individuals and nations—and to insist upon the recognition of these claims as the test of Catholicity. At that time, however, Döllinger could not bring himself to believe that such short-sighted and reckless pilots had really got control of the ship and would keep permanent possession of the rudder. All Ultramontanists, he says, are at heart foes to history and to historical research, for they know that the results of calm and profound investigations are fatal to their system. Occasionally they may portray the life of a single individual or depict an isolated event or epoch in a partisan and polemical spirit, but no Ultramontanist has ever written a connected and pragmatic history.

> "The only noteworthy attempt that has ever been made to treat a whole section of universal history in a Romanistic sense and in accordance with the wishes of the Ultramontane party is Damberger's 'Synchronistic History of the Middle Ages,' in which the author, following in the footsteps of his fellow-Jesuit Hardouin, sets aside as forged or false whatever is opposed to the Jesuitical system."

Besides the discussion of the Syllabus, just mentioned, two other contributions to the present volume, namely, the "Geschichtliche Uebersicht des Konzils von Trient" (written in 1866) and "Pius IX" (begun in 1878, but unfortunately never finished) are here published for the first time. The biography sketches the career of the late Pontiff till about the year 1854, and is in every respect an admirable study of character and a model of clear and condensed narration. Nowhere else is to be found such a faithful and vivid portraiture of the ninth Pius and the first of infallible popes as in this fragment of less than fifty pages. The liberal movement which he inaugurated, the weakness and vanity which rendered the reform a farce, the reaction which followed his return from Gaeta, where he had become a mere tool in the hard hands of Antonelli, and which Massimo d'Azeglio tersely and truly summed up as "priestly vengeance (*vendetta pretina*) in its ugliest form," are all described in a succinct and masterly manner.

According to Dr. Döllinger, Pius IX. had neither literary talent nor artistic taste, and his lack of juristic training, as well as of a judicial mind, prevented him from taking any initiatory or even intelligent part in public affairs. He seldom read anything except his breviary and the *Civiltà Cattolica*, and one had frequent occasion to remark that his opinion on any subject was that of the last person with whom he had chanced to speak. He was fond of cheerful conversation and felt the need of congenial companionship, which he found in a narrow circle of prelates whose ideas, interests, and aspirations all centred in schemes for the extension and consolidation of the hierarchy. His utterances were almost always trite and often trivial, and never revealed any depth of thought, but he combined with an easy fluency of speech the kaleidoscopic gift, so common to shallow and undisciplined minds, of presenting the same theme in endless variations. He was always ready with apt tropes, witty comparisons, and more or less pertinent passages from the Bible, with which he interlarded his already rather unctuous discourse; for his foes and those who had fallen out of favor he had a quiver full of epigrams, ironical retorts, derisive taunts, and sarcastic similes. He was a stately and handsome man, with a rich and melodious voice. His native affability and benignant look, and the blending of conscious dignity and kindly condescension in his manner, fascinated all whom he received. Women thronged to his audiences and were powerfully affected by his presence, which threw them into a sort of rapture, sometimes rising to ecstatic paroxysm. In speaking to priests and nuns he fell into a fatherly and confidential tone which was very becoming to him. But with all his good nature, he readily took offence, and was incalculably capricious; his favor and confidence could be won or lost by the slightest accidental circumstance, and no one was perfectly sure of them, except Antonelli and his Jesuit father confessor. In the latter he put implicit trust, and in most matters accepted the views of this crafty functionary as decisive.

No Pope was ever so fulsomely flattered as he, and his capacity of absorbing and assimilating adulation seemed practically unlimited. Indeed, only a character of rare strength and elevation could have resisted these influences and kept his faculties from being befogged and benumbed by the thick cloud of incense that constantly surrounded him. "Only by a miracle of divine grace can a Pope remain humble," remarks Maffei in his 'Vita di Pio V.'; "with the ninth Pius," adds Döllinger, "the miracle would have to have been ten times greater than with the fifth." He was told that he was "the adored darling of mankind"; that he was not merely a vicegerent of God, as other popes had been, but a divinely commissioned saviour and reformer of the world, whose salvation or destruction depended upon him; he was assured by Bishop Plantier of Nîmes that as king he stood high above all monarchs of his time; and Bishop Rodez fairly raved about the "entrancing and superhuman beauty of his countenance." The priest Alcyoni published an elaborate parallel between him and the Virgin Mary in thirty-one articles ('Le Rosier de Marie,' Paris, 1862); in Utrecht his portrait was worshipped as an altar-picture; and in 1867 it was reported from Paris that miracles had been wrought by tatters of one of his cast-off sacerdotal robes. When the floor of the Church of Sant' Agnese broke through and the Pope and his attendants were uninjured, he was told that angels had borne him up; and a storm which shattered some windows in the Vatican, but spared his private apartment, was represented as an assault of the prince of the power of the air, from which he had been shielded by direct divine interposition. This belief in his immunity rendered him also fearless in good works and in doing his duty: he visited the French hospital in Rome and comforted the cholera patients, firmly persuaded that the devil could do him no harm, even when incarnate in the insidious form of a microbe or comma-bacillus.

But our space forbids us to dwell upon the many fine features and striking points of psychological analysis pre ented in this biographical essay. Other articles of special interest are: "The Past and Present of Catholic Theology," "The Doctrine of Papal Infallibility since the Sixteenth Century," "The Vatican Dogma," two papers on the Inquisition, and a lengthy disquisition on mediæval and modern prophets and prophecies entitled, "Der Weissagungsglaube und das Prophetentum in der christlichen Zeit." The volume is carefully edited by Prof. Reusch, whose scholarly annotations greatly enhance its intrinsic value.

A History of Rome. [Ancient History for Colleges and High Schools. By P. V. N. Myers. Part II.] Boston: Ginn & Co. 1890. Pp. x, 230.

THIS manual history of Rome is a revision of a former work of the author, published with the 'History of Greece and the Eastern Nations.' The maps and most of the cuts which it contains are the same as those in the Roman History of the late lamented William F. Allen, and were furnished by his widow. The book appears to be a good and handy school history, telling what a teacher really should require his pupils to learn in one of the most perplexing subjects in a school course. Prof. Myers of course adopts the prevailing views as to the real character of early Roman history, but he does not on that account banish the legends of the regal period. These legends were what passed for Roman history with Virgil and Cæsar, and if boys are to read Virgil and Cæsar understandingly, they must know what those men supposed to be the origins of their history. After all, when the legends, with their absurdities and inconsistencies, are swept away, we have no real history to put in their place. What Mommsen or Ihne substitutes is an invention, or at best an inference, though it may be a reasonable and probable one. But to read some manuals of history written by devotees of the former, one would imagine that he had dug up from the ruins of Rome contemporary inscriptions giving the true account of the curiæ and the tribes. Mr. Myers has very judiciously given most of the celebrated legends of the regal period in a chapter

supplementary to that containing what he holds to be the most probable view of that period. In the later chapters, the story of the great republican wars, the contests for supremacy in its last century, and the whole of the Empire down to Odoacer is told with much conciseness and liveliness. While one is glad to see the absurd practice of terminating with Commodus, or still worse with Augustus, abandoned, it still seems that the period of the later Republic, and especially the time of the Gracchi, is condensed out of all proportion to the wars of Honorius and Alaric in the end of the book. The questions of antiquities, administration, private life, literature, etc., are transferred to a separate division after the events are concluded; this is a decided improvement for purposes of instruction.

The philosophy of the book appears to us very sound; the author has not allowed himself to have his judgment of great characters perverted by the Cæsarism of Mommsen, or what one might almost designate the profligate views of Prof. Beesly. We can hardly speak as favorably of his style. There is a tendency here and there to the florid, which may answer before enthusiastic pupils in the lecture-room but is only frigid on the printed page. The term "Acropolis of Italy" (p. 58) is a very uncouth transfer from Polybius; and a comparison to a modern writer which has been introduced in the account of Cicero (p. 203), is in the worst taste. Besides points of style we have found little to censure. A scholar writing a history of Rome should be ashamed of the modern corruption *rostrum*, and of saying, "so called because decorated with the beaks (*rostra*) of war galleys." Prof. Myers must know that the Romans themselves never called the stand or desk anything but *rostra*, whatever Americans may call a pulpit or platform. The same correct principle which admitted the regal legends as legends should have given the stories of Valerius Corvus, the Decii, and the Torquati. Pyrrhus's second victory should be named (p. 40). If Milton is to be quoted apropos of Moloch (p. 42), let him be quoted right. There seems no reason for adopting the Greek form Barcas (p. 50), certainly not Roman, and not probably Punic. The Consul Sempronius is Tiberius, not Lucius (p. 59). We should like to have a quotation from the ancient poet who called Corinth the "eye of Hellas" (p. 72). The use of awnings (p. 109) is mentioned by Lucretius long before Cæsar's exhibitions, contrary to the quotation from Gibbon. Surely the "Fulminata Legio" had received that name long before the supposed Christian miracle (p. 141). But serious mistakes are conspicuously absent.

Peintures de Vases Antiques recueillies par Millin (1808) et Millingen (1813). Publiées et commentées par Salomon Reinach. Paris: Firmin-Didot et Cie. 1891. Small 4to, pp. xv and 136, with 31 plates.

By this book M. Reinach has well earned the gratitude of students of Greek vases, first for having reduced into one compact volume all that is of permanent value in the three great folios of Millin and Millingen, thereby increasing their convenience in the same ratio that the cost has been diminished; and second, for having modernized both works by revising the interpretations of the illustrations in accordance with the methods and knowledge of the present day, and also noting all that he has been able to gather of the history of each specimen during the eighty years that have elapsed since the original publication. The amount of thankless drudgery involved in this part of his task only those who have undertaken similar labors can estimate or appreciate, and we congratulate him upon the result, for while it was inevitable that some of the vases published should have disappeared in this long interval, the number that have escaped M. Reinach's vigilance seems to us surprisingly small.

The reduction of the plates has been successfully accomplished, and it is safe to say that nothing but the luxury of the originals is lost to the student. Millingen's work, both in text and drawings, was much more accurate than Millin's. A careful draughtsman, he was thoroughly in sympathy with the kind of art he reproduced, and in the types of faces, as also in the least important details, he showed a scientific exactness which was in advance of his generation; whereas Clener, who made the drawings for Millin, was, as M. Reinach says, willingly inexact. His aim, like that of most draughtsmen of the time, was to make his work artistic at any cost, and to that end he was willing to improve upon his models when he thought it necessary, as, for example, "Par un singulier phénomène d'influence, beaucoup de têtes viriles ont pris un profil napoléonien." Yet, in spite of the looseness of the drawing and the mystical character of the interpretations, which, in the spirit of the archæological commentary at the beginning of this century, could see nothing commonplace in the most commonplace gestures and attitudes, and discovered gods and goddesses in the youths and maidens represented in their daily pursuits and pastimes—in spite of such shortcomings, we think M. Reinach quite right in insisting upon the importance of Millin's book, and the desirability of reproducing it with modern criticisms and corrections; and in his edition it will certainly be what he considers the original—"un ouvrage fondamental, indispensable pour l'étude de la céramique."

BOOKS OF THE WEEK.

A Few Words on Robert Browning. Philadelphia: Arnold & Co.
An Unvested Sister: Recollections of Mary Wiltse. James Pott & Co.
Bacon, Alice. Japanese Girls and Women. Boston: Houghton, Mifflin & Co. $1.25.
Bogardus, Capt. Field, Cover, and Trap Shooting. *Forest and Stream* Publishing Co. $2.
Brewer, Rev. E. C. The Historic Note-Book. Philadelphia: J. B. Lippincott Co. $3.50.
Briggs, L. B. R. Original Charades. Charles Scribner's Sons. $1.
Burr, E. F. Aleph, the Chaldean. Wilbur B. Ketcham. $1.75.
Butler, Agnata F. Herodotus VII. Macmillan & Co. 50 cents.
Chaffee, F. Songs of Spring. Illustrated. New York: Geo. M. Allen & Co. $2.
Comegys, B. B. A Primer of Ethics. Boston: Ginn & Co. 50 cents.
Daniels, Cora. Sardia. Boston: Lee & Shepard. 50 cents.
Dawson, W. German Socialism and Ferdinand Lassalle. 2d ed. London: Swan Sonnenschein & Co.
Delitzsch, F. Behold the Man. Thomas Whittaker. 50 cents.
Delpit, A. Such is Life. Chicago: Laird & Lee.
Dickinson, Mary L. The Living Christ. Fleming H. Revell Co.
Dietz, W. The Soldier's First Handbook. John Wiley & Sons.
Diniz, Julio. The Fidalgos of Casa Mourisca. Boston: D. Lothrop Co. $1.50.
Dowsett, C. F. Striking Events in Irish History. London: Kegan Paul, Trench, Trübner & Co. $1.
Drummond, H. Tropical Africa. 4th ed. Scribner & Welford. $1.
Dunbar, C. Chapters on the Theory and History of Banking. G. P. Putnam's Sons.
Duncan, Sara. An American Girl in London. D. Appleton & Co. $1.50.
Eggleston, G., and Dolores Marbourg. Juggernaut. Fords, Howard and Hulbert. $1.25.
Falconer, L. Mademoiselle Ixe. Cassell Publishing Co. 50 cents.
Fenn, G. M. A Double Knot. United States Book Co. 50 cents.
Fenn, G. M. A Mint of Money. United States Book Co. 50 cents.
Fraser, A. Selections from Berkeley. 4th ed. Oxford: Clarendon Press; New York: Macmillan. $2.10.
Gage, A. P. Physical Laboratory Manual and Note Book. Boston: Ginn & Co. 45 cents.
Garden and Forest. Vol. III. New York: Garden and Forest Publishing Co.
Gentlemen. Brentanos. $1.50.
Genung, J. The Epic of the Inner Life. Boston: Houghton, Mifflin & Co. $1.25.
Gordon, A. J. The First Thing in the World. Fleming H. Revell Co. 20 cents.
Grandgent, C. H. Materials for French Composition. Part I. Boston: D. C. Heath & Co.
Habberton, J. Mrs. Mayburn's Twins. Philadelphia: T. B. Peterson & Bros. 25 cents.
Harrison, Elizabeth. A Study of Child-Nature. Chicago: The Chicago Kindergarten Training School.
Harte, B. A Sappho of Green Springs, and Other Stories. Boston: Houghton, Mifflin & Co. $1.25.
Hastings, G. Philip Hensen. Edward Brandus & Co. 50 cents.
History of St. Georges's Parish. Richmond, Va.: J. W. Randolph & English.
Holland, Rev. F. M. Frederick Douglass, the Colored Orator. Funk & Wagnalls.
Houdard, A. Premiers Principes de l'Economique. Paris: Guillaumin & Cie.
Hutchinson, Rev. H. N. The Autobiography of the Earth. D. Appleton & Co. $1.50.
Japp, A. H. De Quincey Memorials. 2 vols. U. S. Book Co.
Johnston, R. The Primes and Their Neighbors. D. Appleton & Co. $1.25.
Jones-Foster, A. Day Dreams. Imperial Publishing Co.
Keltie, J. S. The Statesman's Year-Book. Macmillan & Co.
Kenyon, F. G. Aristotle on the Constitution of Athens. Longmans, Green & Co.
Kluge, F. An Etymological Dictionary of the German Language. London: G. Bell & Sons; New York: Macmillan & Co.

The Nation.

NEW YORK, THURSDAY, APRIL 2, 1891.

The Week.

MAINE has secured a ballot-reform law after all, both houses of the Legislature having passed it, and the Governor being committed in his annual message to give it his approval. The victory is complete in every way, for the new law applies to every city, town, and village in the State. The history of the two months' struggle for it in the Legislature constitutes an instructive argument against compromises in reform movements. The bill, as finally passed, was first presented in the lower house. It was supported by the united Democratic membership, by the united Democratic press of the State, and by nearly the united Republican press of the State. Its leading opponent was Capt. Boutelle of the Bangor *Whig*, who argued that Republicans should defeat it because it would work to the disadvantage of their party were it to be made a law. In deference to Republican wishes, the bill was amended in Committee of the House so as to apply only to cities and towns of more than 2,000 inhabitants, and so as to have the names of candidates arranged in party groups on the ballots. It was said that these changes would strengthen the bill with the Republican majority. Yet, when it came before the House in amended form, the Republican majority defeated it by a vote of 74 to 71, more than two thirds of their members voting against it. The bill was then taken up by the Senate and passed in nearly its original form. It went back to the House from the Senate, and was passed by a vote of 76 to 60, ten Republicans changing their position after the former adverse vote.

The law, while closely modelled upon the Massachusetts law, contains one provision radically different from the corresponding provision in the latter statute. In Massachusetts the names of all candidates are arranged in alphabetical order under each office, with their politics indicated after each name, and the voter is required to check the name of every candidate for whom he wishes to vote. Under the Maine law the names of candidates are arranged in party groups, with the party name at the top, and the voter can, if he choose, vote for an entire group by placing a cross opposite this party name. This is the method provided in the Indiana and Maryland laws, and is, of course, in the interest of straight party voting. It is, however, superior in every way to our New York system of innumerable separate ballots and "pasters," and while it helps the party voter, it also helps the independent voter, for with the names of all candidates of all parties spread on one ballot, he can easily select those of his choice.

Illinois is likely to be the next State, the twenty-third, to adopt a ballot-reform law. An excellent measure, following closely the lines of the Massachusetts Law, prepared by the Committee of Elections of the lower house of the Legislature, was introduced in that body on Tuesday week. It is the outcome of long and careful study by the Committee, and has been agreed upon unanimously by its members without regard to politics. There were between fifteen and twenty bills on the subject referred to the Committee, the large number bearing unmistakable evidence of the popular demand for the reform. There is said to be little doubt of its passage through both houses, as the leaders of all parties are in its favor; and an emergency clause will be added in order that the bill may go into effect immediately, and thus apply to the judicial elections which occur in June. In order to pass it with such a clause a two-thirds vote in both houses will be necessary; but so popular is the measure that little fear is expressed about getting this strong support.

The Republicans of the Pennsylvania Legislature are so lukewarm upon the subject of ballot reform that the Philadelphia *Press* is exhorting its readers to bombard their Senators and Representatives with letters and petitions in favor of a bill which is pending, but which finds little earnest support. The Republican party leaders are also occupying a questionable attitude towards the reform. It is claimed by the friends of the movement that, in order to be successful, the adoption of the Australian method ought to be accompanied by the adoption of a personal-registration law, and in this they are occupying impregnable ground. Personal registration has been recognized in every State as an absolutely necessary foundation upon which to base the reform. Yet the Republican leaders in Pennsylvania say that personal registration disfranchises thousands of intelligent voters, and is, therefore, not only unnecessary, but harmful. Mr. Thomas V. Cooper, ex-Chairman of the Republican State Committee, leads this opposition, and in a recent interview made this remarkable statement: "I am opposed to it. It would disfranchise 20 per cent. of the voters in both parties. You would find under a personal-registration law that the better class of citizens would not take the trouble to register, and would therefore lose their vote. In New York city, where they have a personal registration, I believe that at least 30 per cent. of the Republican vote is disfranchised, and it is the better element of the community." Mr. Cooper takes a view of the working of personal registration in this city which is new in this region. The difficulty generally recognized here is not in getting the better element to register, but in getting it to take the trouble to vote afterwards. Thirty thousand or more who registered last fall stayed away from the polls on election day, and there is always a falling off of at least 10 per cent. The object of personal registration is to stop repeating, and this is what it has accomplished perfectly in every city in which it has been tried, and there is no room to doubt that it would stop it in the great Republican city of Philadelphia if Mr. Cooper and his fellow Republican leaders would consent to have it tried.

One would suppose that if there were one book only in the English language that an American Pirate would respect, it would be Bryce's 'American Commonwealth.' There is no American of any party who knows anything of it who does not feel himself under obligations to Mr. Bryce for writing it, and it was generally believed when it first appeared that even the Pirate, hardened as he is, would be willing that Mr. Bryce should get whatever pecuniary reward for his labor might be forthcoming from the sale of the book in this country. To rob him seemed too base a thing even for the lowest grade of Pirate, even for the one who put in the Algerine demurrer, alleging that anybody who mingled American matter with foreign matter in a book so that it could not be stolen with impunity, was guilty of a wrong on American Christians meriting reprobation by the courts. But apparently the basest and meanest Pirate has not until now come to light, for a Chicago Pirate is going to steal Mr. Bryce's book by the aid of the photographic process which has already made possible the Wanamaker, Funk, Ehrich, and other thefts. This bold attempt is doubtless precipitated by the passage of the Copyright Bill, and we are likely to hear of others before next July—indeed, Funk & Wagnalls have, since we began writing, come out in competition with Sergel & Co. "Now or never" is probably the cry in many a Pirate's cave. In three months more they will have to pay for all the goods they deal in, and the prospect is naturally bitter, and as much hay as possible must be made while the sun shines.

The fraudulent reprint of Mr. Bryce's book cannot be issued in complete form on account of the copyrighted chapters, but the danger is that a careless public may not take this into account, and may buy the piratical edition, thinking it to be as accurate and complete as Dr. Funk says his "Allen reprint" is. A cheap author's edition is now in process of production, and will be issued in a very few days, and we trust that all Americans who, besides being honorable men and women themselves, are concerned for the honor of their country, and have still to provide themselves with a copy of Mr. Bryce's book, will see to it that they get an honest as well as a complete copy. Mr. Freeman must not imagine that the Chicago Pirate's aim in getting out his edition is to spread Mr. Bryce's fame, or to increase the circulation of the book

in order to aid in the cultivation of the American people. Some Pirates call all this "metaphysics," and others "poppycock." What they seek is a handsome pecuniary profit on each copy sold, and they would just as soon photograph and sell the 'Newgate Calendar' as the 'American Commonwealth,' if they could make as much money out of it. Moralists who are trying to put down theft in any form must be as careful to free themselves from illusions as thieves always are.

The Boston *Journal of Commerce* learns that Judge Lawrence, the Chief of the Ohio Wool-Growers' Association, has begun to worry the carpet-manufacturers again by demanding that the wool-sorting clause of the McKinley tariff shall be applied to wools of the third class. This clause provides that if any wool has been sorted or increased in value by rejecting any part of the original fleece, the rate of duty shall be twice what it otherwise would be. This provision requires that somebody, presumably the United States Consul at the foreign port, shall penetrate into the interior of the country where the wool is produced, and ascertain whether the shepherds, in making up their packages, reject "any part of the original fleece." If they do, then the duty is to be "twice the duty to which it would be *otherwise* subject." "Otherwise," the *Journal of Commerce* contends, means the duty on unsorted wool. But if there is no unsorted wool brought to market, how is its value to be determined? Wools of the third class are subject to ad-valorem, not specific duties. Shall the Consul guess at the value of an article that is not sold in the market at all? It is a very interesting state of things indeed, and it is made more so by another push that we understand Judge Lawrence is making, namely, to have all wool classed as clothing wool that *can be* used for the manufacture of clothing. If the Judge perseveres, he will, no doubt, make it a penal offence to import any wool into this country for any purpose whatever and at any rate of duty whatever. Protection is justified of her children.

Gov. Davis of Rhode Island, who is a Democratic official of the ordinary kind, that is to say, is holding only one public office at a time, is not able to agree with Gov. Hill upon the question of deciding the rights of the Governors of other States to the office whose duties they are exercising. He has, therefore, consented to receive and honor a requisition from Gov. Bulkeley of Connecticut for the surrender of a fugitive from justice, and in doing so says: "As Bulkeley is in possession of the official seals, Bulkeley is Governor *de facto*, and I do not feel that I can properly decline to recognize him as the Executive." Personally, Gov. Davis says, he thinks Judge Morris is the lawful Governor, but, as he is not in possession of the office and its seals, he cannot send requisitions. "I have heard all the arguments about Gov. Hill," adds Gov. Davis, "but my conduct is not to be regulated by the conduct of any other man. At Albany these points may appear different from the way we look at them in Providence." That is the secret of the difference in the conduct of the two men—it lies in the point of view. Gov. Hill is under the impression that he is a Presidential candidate, and his point of view is that he can acquire capital for himself in that capacity by making New York State a safe harbor of refuge for criminals.

Valuable testimony to the progress of the Georgia negroes is furnished by the Atlanta *Constitution*. It says that there is a growing tendency on their part to "take care of themselves"—to be independent and "hoe their own row." As an illustration of this tendency it notes the fact that the negroes in a number of Georgia cities have for some time past been making strenuous efforts to secure the location of a proposed negro college; and that, while generally, when they have schemes of that character in hand—or schemes of any kind, for that matter—they appeal to the whites for aid, in this instance (and notably in Americus) they evinced a disposition to be more independent, and in Americus refused offers of aid from the white people and made up the money among themselves. This is certainly a most hopeful sign, and it is only one of many which are to be seen in various parts of the South. Hitherto this disposition to rely upon themselves has been checked by the feeling, which Republican politicians have so sedulously cultivated, that the negroes were still "wards of the nation," who could not take care of themselves; but with the general recognition that they must hereafter be regarded merely as citizens, this demoralizing influence will be removed, and their progress will be more rapid than ever before.

That was a shameful scene at Pittsburgh on Sunday when a number of Chinamen, while engaged in burying a fellow-countryman according to the rites of their religion, were attacked by a great mob of hoodlums, who snatched the burning joss sticks, perfumed paper, and printed prayers placed beside the grave, and jeered and howled at the mourners. But, after all, it was not so discreditable a performance as the sending by the United States Government as Minister to China of a man who, as a member of the Senate, has expressed supreme contempt for the whole race of Chinese. The Pittsburgh mob was composed of ruffians whose acts are condemned by the decent people of the city; but the insult of Mr. Blair's appointment as Minister to China cannot be thus easily explained away. It was the deliberate act of the Government of the nation, and its grossness can only be comprehended when we put ourselves in the place of the Chinese, and think how we should feel if that empire should send as Minister to the United States a Chinaman who had abused the people of this country, and declared their migration to China comparable to an outbreak of yellow fever.

It would be difficult to express in language that would not seem extravagant, our sense of the loss which this city has sustained in Dr. Crosby's death. He was not simply a good man. He was a good man who was willing to spend himself without limit in the public service. He journeyed, wrote, talked, persuaded, inveighed, explained, and defended in the service of every movement which seemed likely to make New York a purer, more wholesome, and more comfortable dwelling-place for rich and poor. In all his work, too, his judgment was in the main sound—something which cannot always be said for the zealous and energetic. He seldom made mistakes, and when he did make them, he never had any hesitation in confessing them. He was a scholar from his youth, and, what is still more, kept up his scholarship to the end in spite of the thousand distractions of his pastorship and of a very steady attention to public affairs. In spite, too, of the innumerable antagonisms into which any man who tries to "make reason and the will of God prevail" in a city like this, we feel sure he made no enemies except among criminals. He was, in short, one of the most valuable citizens we had, and he has been taken away at a time when his influence was most sorely needed.

We find a great many little ten-line paragraphs in our Republican contemporaries chuckling over Mr. Phelps's article and announcing that he is "conclusive." But we look, and have looked in vain for months, for any discussion of the subject by these publicists themselves, with any knowledge or sign of knowledge. They all cry "Ditto" to Mr. Blaine, and "Ditto" to Mr. Phelps, but they apparently have no better reason for saying "Ditto" in each case than children would have in a primary school for agreeing with the teacher about the virtues of ass's milk in consumption. It is sad to see so many counsellors of the public in this helpless condition. Neither Mr. Blaine nor Mr. Phelps can feel flattered by such adhesions. The concurrence of one man who knows or professes to know something about the matter in hand is worth more to a Sage or Philosopher than the huzzas of 10,000 ignoramuses. Has any such man come forward to back them up about the "bonos mores," and the *mare clausum*, and the ocean game laws? None that we know of.

One of the legal authorities of repute who will have to be rewritten if the Blaine-Phelps doctrine about the ownership of animals *feræ naturæ* is accepted, is Blackstone. As Mr. Phelps lays down the law in regard to Bering Sea seals: "This colony of seals, making their home on American soil, and unable to exist without a home on some soil, belong to the owners of the soil, and are part of their property, and do not lose this quality by passing from one part of the territory to another in a regular and periodical migration necessary to their life, even though in making it they pass temporarily through water

that is more than three miles from land." Blackstone has a good deal to say about the ownership of wild animals, beginning with the proposition that they are common property unless under certain restraints and conditions. Noting the individual ownership of wild animals that have been tamed, he says:

"In all these creatures, reclaimed from the wildness of their nature, the property is not absolute but defeasible—a property that may be destroyed if they resume their ancient wildness and are found at large. For if the pheasants escape from the mew, or the fishes from the trunk, *and are seen wandering at large, in their proper element, they become feræ naturæ again, and are free and open to the first occupant that hath ability to seize them.*"

Again, in treating of the individual right to the young of such wild animals as make their nests or breeding-holes on one's land, he says: "I have a qualified property in those young ones *till such time as they can fly or run away, and then my property expires.*" This covers the case of young seals exactly. Once more. In discussing the ownership of game on one's property, Blackstone says that the game animals belong to the owner of the soil "so long as they continue within his liberty; *but the instant they depart into another liberty this qualified property ceases.*" What is wanted now by believers in the soundness of Blackstone is some legal citation to show that national rights to animals *feræ naturæ* differ from individual rights. We have been unable to find any. We presume Yale College still gets some of its common law from Blackstone.

The arrangements for the settlement by arbitration of the difficulty between France and England over the French lobster fishery in Newfoundland have all been completed, and the three arbitrators have been chosen. These are M. de Martens, Professor of the Law of Nations in the University of St. Petersburg; M. Rivier, Swiss Consul-General at Brussels, and President of the Institute of International Law; and M. Gram, ex-judge of the Supreme Court of Norway. In addition to these there are to be two delegates from each of the parties to the controversy, who will form the medium of communication between the Governments and the arbitrators, but they are to sit and vote with the arbitrators, and every question is to be decided without appeal by a majority of the seven. In the negotiations which preceded this arrangement, Lord Salisbury pleaded hard either for the surrender of the "French Shore" altogether to the colony by France, in consideration of free bait for the French fishermen and the payment of a pecuniary indemnity, or for the reference to the arbitrators of the whole question of the reasonableness and expediency of French claims in Newfoundland, and of the best mode of extinguishing them. M. Ribot, however, positively refused to submit anything but the question whether lobster fisheries, as well as cod, were covered by the Treaties of Utrecht (1743), of Paris (1763), and of Versailles (1783). This settlement by no means gets the British Ministry out of hot water. The Newfoundlanders are indignant over the restriction of the arbitration to lobsters. They demand complete release from French occupation of their soil, conceded over a century ago, when, as Lord Salisbury says, "the coast in question was almost uninhabited, and the two contracting parties considered Newfoundland simply a fishing ground." They maintain—and Lord Salisbury argued the case for them very well — that the circumstances have changed so completely since the treaty was made, and the advantages France obtains under it are so small, that it is monstrous to insist on its maintenance. Doubtless M. Ribot sees all this as well as they do, but public opinion in France would not permit his surrendering French rights for a money compensation from Newfoundland. The French confidently expect to use the affair to get something more valuable than money from England.

The question of rescinding the decree which excludes American pork from Germany is still under consideration by the Imperial Government. When Caprivi succeeded Bismarck as Chancellor, this was one of the first subjects to engage the attention of the new Ministry. They were not committed, as Bismarck had been, to any particular policy. They were as free to make a change here as in any other branch of public affairs, and they were favorably disposed towards the United States. Of course such a step could not be taken instantly. It must be preceded, for appearance sake, by a certain amount of bureaucratic investigation and red tape, but the intention to rescind nevertheless existed. While things were in this favorable trim along came the McKinley bills, both of them—one putting new and exasperating obstacles in the way of German exports, the other increasing duties to a monstrous degree. These measures barred the way for the new Chancellor. They raised up new enemies to his intended policy, and armed the opponents of it, the landed proprietors, with new weapons. Bismarck himself was not slow to see the opportunity that McKinley had thrown in his way to embarrass his successor. We have the best authority for saying that this is the real reason why the decree against American pork has not been rescinded.

During the past month there have been numerous press despatches from Madrid implying that negotiations were going on between our special envoy, Mr. Foster, and the Spanish Government touching a treaty for reciprocity between the United States and Cuba. The word treaty is hardly applicable in this case, because all treaties between the United States and foreign countries have to be ratified by the Senate. The present negotiation will not require ratification, any more than the Brazil arrangement did. It is a one-sided affair altogether, based upon the McKinley Bill. Under that measure the President has the power to reimpose the duties on raw sugar coming from any country which, in his estimation, is not trading fairly with us. Now, Spain is a protectionist country. Cuba is a part of the kingdom for all fiscal purposes as much as California is a part of the United States. The Spanish millers have an advantage over our millers in trading with Cuba, just as our cotton-manufacturers have an advantage over the English in trading with California. The Spanish millers are stoutly opposing the thing called reciprocity that Mr. Foster offers them. Very likely their opposition will be effectual. Then the question will arise in the Cabinet council at Washington whether the duty on raw sugar from Cuba shall be reimposed or not. If it is reimposed, that will be equivalent to a denial of free sugar, about which we have heard so much boasting from the McKinleyites. This will be the effect, because Cuba and Porto Rico supply the larger part of our raw sugar. In 1889 our total imports of cane sugar were $69,000,000 worth, of which Cuba supplied $36,000,000 and Porto Rico $2,700,000. The Philippine Islands sent us $4,000,000 worth. Our total importations of beet sugar amounted to $7,000,000. It is plain, therefore, that a reënactment of the duties on sugar from Cuba would be equivalent to a denial of free sugar to American consumers. It would be more than that: it would be equivalent to a large donation to other sugar-producing countries; it would operate towards those countries exactly as the admission of Hawaiian sugar free of duty operated towards the Hawaiian Islands. Perhaps the Spanish statesmen are able to see Mr. Harrison's dilemma as well as other people.

In all the large towns of Ireland Parnell seems to have a small and enterprising mob at his disposal who make it lively for his opponents, who in turn contribute to the disorder. That this state of things does not depress the English Home-Rulers more is probably due to the consideration that this is the first real political contest that has taken place in Ireland since the Union. All previous Irish elections have been sham battles which were not to have any more effect on Irish legislation than on that of Holland. The Irish voters are now, for the first time in their history, exerting a real influence on the fortunes of their own country, and it is almost unreasonable to expect, considering the bellicose habits of the population, that they should pass through an experience so novel without a little cudgel play. Dalton's pummelling Healy in order (probably) to prevent his appearing on the stump in Sligo, shows the meeting of the two régimes—the old and the new. Healy was pummelled partly under the influence of the old Irish tradition that a political opponent ought to have his head broken; but the incident also contained an admission that persuasion had become a great force in the land, and that Healy was a powerful persuader. It is not so very long since it would, even in England, have been considered "good politics" to keep an opponent away from the hustings by engaging him in a standing fight under the rules of the ring as they existed for the time being.

MORALITY IN DIPLOMACY.

MOST of the points in Mr. Phelps's late article in *Harper's Monthly*, in so far as they are points of international law, will be before long disposed of by the Supreme Court or by the arbitrators, so that there is little use in arguing them further in the columns of a newspaper. But there is one passage in the article which has an abiding interest, especially for that younger generation which is now trying to rid American politics of corruption under the various forms of bribery, lying, and cheating. It is this:

"In this, as in all other international controversies, one remark holds good: a nation divided against itself can never achieve a diplomatic success. A government that is not backed up by the unanimous sentiment of its people, but is opposed in its dealings with foreign nations by a large share of the best intelligence of its own country, if not in the ends it seeks, at least in all the means it takes to obtain them, will never be a formidable figure in diplomacy, especially when its force is found to expend itself in argument rather than in action. To peruse the discussions of most questions of this sort in the American press would lead the unlearned reader to conclude that one proposition in international law, at least, can be regarded as settled; that is, that whatever is asserted by our own Government is necessarily wrong. This point is readily conceded by our adversaries, but tends more to simplify disputes than to conduct them to results favorable to our own side. If our Government is demanding what is wrong, the demand should at once be abandoned. If it is claiming what is right, and what is worth claiming, it should receive the support of all parties, whether all the points taken, and all the arguments by which it endeavors to support its case, prove universally convincing or not. The task of refuting them may be well enough left to the other side. In the course of this controversy, very little has appeared in print in the United States which tends to support our Government, or to indicate that American public sentiment sustains it. But much ability and learning have been devoted to answering the arguments and disproving the facts upon which the Government has relied. The authors can have the satisfaction of knowing that all these contributions to the British side of the discussion are promptly put on file in her Majesty's Foreign Office, and will not fail of their effect. Great Britain affords us no corresponding advantage. Not a word has been uttered or printed in that country, so far as is known, against the Canadian contention, or in support of that of the United States."

At first sight, Mr. Phelps's contention here seems to be that a good citizen should in all cases "back up" his own Government in a controversy with a foreign Government; and the only way in which a good citizen can "back up" his Government in such a controversy is by maintaining against all comers that all propositions of law or fact produced by his own Minister of Foreign Affairs are absolutely correct, and that the object aimed at is just and laudable. But on looking at the passage a little more closely, we see that he does not ask anything so monstrous of the good citizen. He does not say that a good man must, whenever his country gets into a controversy with a foreign nation, place his conscience and intelligence absolutely at the disposal of the person who happens at the time being to have charge of the State Department, for he does not maintain that in all such controversies our Government is sure to be in the right. He says, "If our Government is demanding what is wrong, the demand should at once be abandoned"; that is, he admits that governments—our own included—do sometimes make demands on foreigners which are "wrong." By wrong we presume he means demands which are not justified by the rules of international law, or are not justified by the evidence of facts in the case, or are in some way opposed to the rules of Christian morality under which all civilized nations now live. We see thus that there are three distinct varieties of wrong, any one of which may taint a demand on a foreign State, and make necessary, according to Mr. Phelps, an immediate abandonment of the demand.

But here comes a very curious hiatus in the argument. He does not tell us how the quality of the demand made by our Government is to be ascertained, or how, if wrong, its abandonment is to be brought about, for he absolutely forbids public discussion of it by the citizen through either press or platform, or through any channel which will carry a knowledge of the discussion to the foreigner. Salisbury must not be allowed to hear that some Americans think that Blaine is mistaken, and Blaine must not be allowed to hear that all Englishmen do not agree with Salisbury. By "discussion" we mean, of course, the public presentation of the pros and cons of the dispute; not simply laudation of the despatches written on our side, but a public examination of the law and the facts by competent lookers-on. You must not say things which will throw discredit on your own man. You must back him up, no matter how much you may think him mistaken. You must talk as if your Government were engaged in actual war and the national existence were at stake. How, then, is the Government to find out that it is demanding something wrong; and on what compulsion, the discovery made, is it to confess its error and apologize to its antagonist? Mr. Phelps is too shrewd a man to believe that human nature has made arrangements for the performance of these acts of contrition by Secretaries of State themselves on the promptings of their own conscience, in the midst of exciting disputes.

Perhaps the oddest thing in Mr. Phelps's position is that not only does he not provide us with the means of judging whether the diplomatic demands of a Government are right or wrong, but he has apparently provided none for himself. He intimates that we ought all to have supported Mr. Blaine in the present dispute, but does not tell us how we could have known whether Mr. Blaine's position was sound or not. It is possible, surely, that Blaine has not been "claiming what is right," and yet there must be some portion of the community competent to find it out. Mr. Blaine has not been transformed since he took the Secretaryship of State. Therefore let us ask how it happens that the fact "that in the course of this controversy very little has appeared in print in the United States to support our Government, or to indicate that American public sentiment sustains it," while "much ability and learning have been devoted to answering the arguments and disproving the facts upon which the Government has relied" has not made more impression on Mr. Phelps. Is it not possible that "American public sentiment does not sustain" Mr. Blaine? Is it not also possible that the reason why no "ability and learning have been devoted" to backing him up is, that the Americans who have ability and learning at command for such service think his position untenable? Is there not in this very situation as Mr. Phelps describes it enough and more than enough to put a prudent man on his guard against Mr. Blaine's diplomacy? Has not Mr. Phelps been taking on himself a tremendous responsibility in advising Mr. Blaine to risk war in support of a case which he acknowledges has received no sign of support from that portion of the American community which best understands it?

Mr. Phelps knows one very important fact in the history of diplomacy. We may not in our time agree by any means with that biting epigram, that "ambassadors were men sent to lie abroad for their country." Things have improved since that was uttered. But he knows perfectly well that ministers of foreign affairs are not chosen in our own country, or in any other either, for their high character, or their great learning, or their keen sense of right and wrong, or their special fitness for the place. In popular governments like ours and that of England and of France, the ministers of foreign affairs are men who have succeeded by hook or by crook in domestic politics in acquiring a title to a high place of some kind in the government when their party comes into power. Their accession to that particular office does not elevate or purify them. Mr. Blaine is not noted for his truthfulness or scrupulousness. Neither is Lord Salisbury. Neither of them is suspected of having the slightest hesitation in using the foreign policy of his country to help his party or himself in home politics. Lord Salisbury has done it; so has Mr. Blaine.

What Mr. Phelps proposes to his fellow-citizens, and to the youths whom he is instructing, is, that when two men of this description, who happen to have got hold of the foreign offices of their respective countries, start a dispute of any sort about land or water, fish, flesh, or fowl, the duty of the taxpayers who pay the expenses of the quarrel, and may be called on to sacrifice their lives in it, is simply to "back up" their arguments—that is, to profess to believe all their assertions, whether they believe them or not; to accept all their law whether they think it bad or not; to swallow their interpretations whether they think them erroneous or not, if they speak out at all; or else to keep silent, while a man whom they may consider a charlatan, without either patriotism or convictions or knowledge, is carrying their country straight to a bloody war. Under what code of morality is this justifiable?

There was a time when this view was generally accepted, but it was the time when war was considered the chief business of a government, when the Ingalls view of political morality controlled international intercourse, and when all international disputes—even the loss of Capt. Jenkins's ears—were considered sufficient cause for a re-

sort to arms. But it was a good while ago. Mr. Phelps is fully a century behind the age. With the appearance of the United States on the scene as a state without hated neighbors, without warlike traditions, without a governing class, with the utmost publicity thrown over the whole administrative machinery, and with every act and resolution and even impulse created or directed by the freest discussion—secret, lying, perverting, equivocating diplomacy received a serious blow. It did not vanish from the earth, it is true, because diplomatists have still to be men, but it placed over them a watchful, moral, religious, and intelligent public, to pronounce on the reasonableness and lawfulness of their acts, and to follow every step of their discussion with the criticisms and suggestions of that best class of citizens—honest men—who will neither do wrong themselves, nor knowingly allow it to be done in their name by others.

There are two fine lines of Lowell's, in his "Epistle to George William Curtis," which, as they contain an immortal truth, are worth recalling every day in the week:

"For never land long lease of empire won
Whose sons sate silent when base deeds were done."

We feel sure that if Mr. Phelps had considered the matter historically, he would never have asked his countrymen to surrender their political conscience to Mr. Blaine's keeping. He would have remembered that he could not enter a portrait gallery in France or England, or in his own country, in which some great man who had stood out against wicked diplomacy would not look down on him with dissent. He would see Burke and Chatham, who opposed the attempt to subjugate the colonies, and Fox and Mackintosh, who opposed the attempt to subjugate France. He would see Cobden and Bright, who opposed the Crimean war. He would see Gladstone and Morley and Argyll and Goschen, who opposed the Afghan war. He would see Thiers and Gambetta, who opposed the German war. In our own country he would see Adams and Hale and Giddings and many others, who opposed the Mexican war. All these men wished their country, as Mr. Phelps does, to make "a formidable figure in diplomacy," but a figure formidable because "its armor was its honest thought and simple truth its highest skill."

THE NEW BERING-SEA POLICY OF 1886.

An inquiry by the *Evening Post*, begun to ascertain the date when the interpretation of the laws of 1868 and 1870, relating to fur seals, and the method of executing those laws, were changed by the President or the Secretary of the Treasury, has thrown the partisans of Mr. Blaine into a paroxysm of rage.

The law of 1868 commanded the Secretary of the Treasury "to prevent the killing of any fur seal" within the limits of Alaska Territory "or in the waters thereof." The law of 1869 made our Pribyloff islands "a special reservation for Government purposes," and forbade any one to land or remain thereon excepting by authority of the Treasury. The law of 1870 authorized a lease of the islands to "The Alaska Commercial Company," and made it unlawful to kill any fur seal thereon, or "in the waters adjacent to the said islands," unless during certain months and under regulations provided for in the law. On August 3, 1870, a lease of the islands to the company was signed, in behalf of the Treasury, by Assistant Secretary Richardson. Secretary Boutwell was opposed to the monopoly, and conveniently absented himself from Washington when the lease was to be executed.

The law of 1870 and the lease permitted the killing of fur seals. The law of 1868 had peremptorily forbidden it anywhere and everywhere in Alaska. The law of 1870 and the lease necessarily, therefore, required modification of the interpretation of the law of 1868 left standing, and of its execution.

So far as we can discover, President Grant, who was responsible for the faithful execution by the Treasury of the laws of 1868 and 1870, decided that the revenue cutters were only to defend the islands and "adjacent" waters from fur-seal killing by any persons excepting the lessees. Boutwell's letter of 1872, doubtless written under the supervision of Secretary Fish, conforms to that decision. When the three Canadian vessels had been seized, in August, 1886, Admiral Seymour cabled the Admiralty that those vessels had, for three years, without interference, and "*in company with Corwin,*" the seizor, killed fur seals in Bering Sea. Up to that time only two vessels, one German and one American, had been seized, and in both cases for killing *on land* done by the crews, and not for killing on the water. Up to 1886, the efforts of revenue cutters and Treasury agents had been limited to those persons attempting "to poach upon the Federal preserve," as defined in the law of 1869. The first three Canadian vessels seized on August 1, 1886, were charged with killing seals a great distance from any land; Lord Iddesleigh complained to Mr. Bayard early in the next October, but, on January 12, 1887, the latter replied that the "circumstances attendant on their seizure" were then unknown to him, although five months had elapsed.

In a report to Washington, in 1886, by the Governor of Alaska is a significant allusion to the seizing of the three vessels by the "zealous and meritorious commander" of the *Corwin*, and to the necessity of protecting the seals "on their way to and from their breeding-places." In that report is the first suggestion and development of the theories and the interpretation of the statutes of 1868 and 1870, which are now used to uphold seizures outside of the marine league or in waters not adjacent to our islands. On March 2, 1887, an American firm in San Francisco (Handy & Co.) remonstrated by letter with President Cleveland for the seizure of their vessels for killing seals in the open waters of Bering Sea, and declared that, under the decision of United States Judge Deady (4 Sawyer's Reports, 105), of Secretary Boutwell, 1872, and the permission implied by the knowledge of the cruising revenue cutters and their abstinence from interference till 1886, "every citizen had a right to fish for fur seals in the waters of Bering Sea when distant a full marine league from the shore." That letter was printed in the New York *Herald* of March 17, 1887.

The evidence is overwhelming that, during the Administration of Grant — in whose time the laws were enacted, the lease made, and the due execution of the laws provided for—and presumably under the watchful eye of Secretary Hamilton Fish, there was no thought of seizing outside of three miles from land for killing done outside of that limit. Boutwell's letter of 1872 fits that theory perfectly. Neither President Hayes, nor Garfield, nor Arthur changed the policy. Nor did Secretaries of State Evarts, Blaine, or Frelinghuysen, or Secretaries of the Treasury Richardson, Bristow, Morrill, Sherman, Windom, Folger, Gresham. But suddenly, in 1886, came a change of policy and a new interpretation of the statutes of 1868 and 1870. Of the nineteen vessels seized up to June 30, 1887, ten were American. No seizures were made in 1888. All the evidence shows that in 1886 subordinate officials on the Pacific Coast invented a policy of their own, seized and condemned, without an iota of new authority from President Cleveland, Secretary Bayard, or Secretary Manning. Indeed, those high officers seem to have been in profound ignorance of seizures contemplated or made till told by the British Government. During 1886–'87 there was, in fact, a sort of paralysis of Treasury initiative and control in Bering Sea. The Alaska Commercial Company really usurped executive power in the affair, using Government revenue cutters and Alaska courts for company purposes.

FRUITS OF DEMAGOGISM.

One of the acts by which the Fiftieth Congress distinguished itself was that throwing steam presses out of the Bureau of Engraving and Printing. At a general assembly of the Knights of Labor in Minneapolis in October, 1887, resolutions were adopted demanding "that the Government securities, notes, bonds, checks, and stamps shall be printed in the highest style of the art of plate-printing from hand-roller presses so as to secure the Government against loss by wear and counterfeiting." This solicitude for the protection of the Government had no other basis than opposition to a valuable labor-saving device; and the deference paid by Congress to the demand of Labor has had the precise effect that we anticipated at the time. The cost of printing the Government securities has been greatly increased; and the inability of the Bureau to meet the demands made on it, resulting from the compulsory use of clumsy and antiquated machinery, has brought about a serious arrearage of work.

The steam press is as much superior to the hand-roller press as a locomotive is to a stage-coach. In spite of the heavy royalties that the Government had to pay for

its use, it effected an important saving, the return being $5 for every $1 expended, or an economy of $5,000 a year for each press. Before the commands of Labor were obeyed by Congress, steam presses were used on internal-revenue work and on the backs of United States notes and silver certificates; for some inscrutable reason, they were not thought to be quite fit to print the faces of these securities; this part of the work of the Bureau was reserved for the hand presses. The cost of the steam-press work was four dollars per thousand sheets; that of the hand presses, fourteen dollars per thousand. The aggregate number of sheets printed in the Bureau now reaches forty-seven millions per annum; and of these, thirty-two millions are revenue stamps. Were the revenue stamps printed on the steam presses, the saving would be $320,000. Were the backs of United States notes and silver certificates printed on these presses, the saving would be still greater. The statement that we made two years ago, that the proposed surrender to the demands of Labor would cost the people of this country more than $300,000, is no longer open to dispute.

But this is not the only price paid for this piece of demagogism. Ever since the steam presses were stopped, work in the Bureau has been more or less in a state of congestion. Capt. Meredith, the new Chief of that division of the Treasury Department, was obliged to purchase forty-seven new hand presses at a cost of $150 each; later he had to make an addition of forty-three; and now he finds that he must make another increase of one hundred and twenty-five—a total of two hundred and fifteen. This of course involves the employment of two hundred and fifteen plate printers, who work by the piece and earn an average wage of thirty dollars a week, and the same number of women assistants, who receive a little more than a dollar a day. This more than warrants our statement made two years ago that the substitution of hand presses for steam presses would necessitate the addition of one hundred and fifty plate printers.

At the time that Labor achieved its triumph over invention, every available foot of space in the bureau appeared to be occupied, and either an addition to the building or the displacement of some of the hand presses by the more efficient steam presses was required. In the room occupied by the hand presses enough steam presses could have been set up to supply all the public need. But the prospect of the displacement of a few plate-printers filled Labor with alarm, and in one of its petitions to the statesmen in the Capitol it declared: "Unless Congress interferes, the attempt to force the steam presses upon the Government will succeed, and every kind of obligation will be printed on them, rapid cheap work being substituted for good but more costly work." Demagogism listened to this frantic appeal, and as a consequence the Fifty-first Congress was compelled to make an appropriation of $80,000 for the increased room necessary for the new hand presses.

By unexampled crowding, space has been found for the ninety new presses introduced since the steam presses were thrown out; but it will not be until the addition is completed in July that enough hand presses can be put in operation to do the work of the Bureau under normal conditions. For some time past, the plate printers have been working two and a half hours overtime without arousing the sympathies of Labor; and at the beginning of last week, the Government was inconsiderate enough to add another hour. By this means, it is hoped that the arrearage of work may be reduced, and the inconvenience to which the United States Treasurer and the Internal Revenue Commissioner have been subjected will be removed. This latter official has been put to his wits' end to provide the stamps demanded by the revenue collectors throughout the country. In defiance of the law which provides that a three months' stock of stamps shall always be kept on hand, he has been obliged to issue them green and uncured. United States notes and silver certificates have also been issued in the same condition, and, as a consequence, they have been soon returned to the Treasury as unfit for use.

It is said that the situation has made the President and Secretary of the Treasury very anxious; they fear that in case a breakdown should occur in the Bureau, the supply of notes, stamps, certificates, and other securities would be cut off. Such a catastrophe might not be undesirable in the least, if it should only call public attention to the absurdity and costliness of using a machine that is as much out of date as a wooden plough or a flint hatchet, and lead to the exposure of the silly claims of Labor. Any one with a pair of good eyes and with a silver certificate printed two years ago, can determine for himself whether the work of a steam press is inferior to a hand press, and whether the one facilitates counterfeiting more than the other. The back of that certificate was printed on a steam press; if it be compared with the back of a certificate printed since the steam presses were thrown out, no difference of the least consequence will be detected. Even the experts that Labor placed on the stand two years ago, when the Senate Committee on Finance was investigating the question, could not tell the difference, although the petition already mentioned declared that "no expert with any regard for his reputation will hesitate to pronounce the work done by such presses as inferior." It was shown before the Committee that all the silver certificates that had been counterfeited previous to September, 1888, were printed on hand presses; and that hand-presses have not thwarted the counterfeiters' skill is demonstrated by the discovery, announced in Sunday's despatches from Washington, of a most dangerous counterfeit two-dollar silver certificate.

BOYCOTTING FOR BLACKMAIL.

THE unusual course which the State Board of Arbitration has taken in making a special report to the Legislature of their recent investigation of the clothing-cutters' lockout in Rochester is fully justified by the facts brought out in the inquiry. The sixty printed pages of testimony which accompany the report furnish remarkably interesting reading, giving as they do a succinct and complete narrative of one of the most brazen schemes for levying blackmail to be found in the history of boycotting as it has been developed in Mr. Powderly's noble and holy order of the Knights of Labor.

The manufacturing of clothing is one of the largest industries of many that are carried on in the city of Rochester. According to the report of the Board of Arbitration, the annual output of ready-made clothing reaches $10,000,000 in value, the annual aggregate of wages is $3,000,000, and the employees, men, women, and children, including about 5,000 families, number about 20,000, or about one-seventh of the entire population of the city. Early in the month of March this great industry came to a standstill through the combined action of twenty-one manufacturing firms in dismissing the cutters in their employ, about 350 in all. All the dismissed men were members of a local assembly of Knights of Labor, and the reason which their employers gave for their course was that they were unable to continue their business because of the insistence, on the part of the national organization of the Knights, on the right to dictate to the employers the terms upon which the local Knights should be employed. The sudden arrest of so great an industry produced the results inevitable in such cases. There was destitution and suffering in thousands of families, and the industrial and commercial life of the city received a violent shock. The State Board of Arbitration put in an appearance and made unavailing efforts to harmonize the differences between the manufacturers and employees. It then began an investigation into the causes of the trouble, sitting for three days and going into the subject with great thoroughness. We shall give as briefly as possible the main facts brought out.

The first signs of trouble appeared in the fall of 1889, when various manufacturers began to receive calls from John G. Thein, Vice-President of the Garment-Cutters' and Trimmers' National Trades Assembly 231 of the Order of Knights of Labor, and Frederick Archer, Master Workman of the same organization. One firm would be told that they were employing one more apprentice than the rules of the order permitted; another would be told that they were giving an apprentice a kind of work which the rules of the order forbade; another would be told that they were paying men for extra work which the rules of the order forbade, or were inducing them to work on half-holidays, which was also forbidden. In each case, when Thein or Archer was informed that the firm insisted upon managing their affairs in their own way, the insolent rejoinder was that they (the firm) would soon discover that they would not be allowed to do that, and that they would be very glad to change their minds before very long.

Soon after these visits, there came to the resisting firm a letter from James Hughes,

at first stationed in Omaha, and subsequently in Chicago. Hughes wrote all his communications on paper with the pompous heading, "Office of National Trade Assembly 231, Garment-Cutters and Trimmers of North America, Order of Knights of Labor," and began invariably with the formula: "Gentlemen: In my official capacity as Chairman of the Garment-Cutters and Trimmers of North America, I am called upon by our organization, located at your city, to try and straighten out trouble with our organization and your firm." He then went on to say that the Executive Board of the local assembly had "waited on" the firm and had stated its demands, which had not been granted, and that he had been called in to assist in the matter. From this point on Hughes generally wrote like a bully and a blackguard who was too dull to comprehend the illegal character of his threats and requirements. We append a specimen of his usual letter at this stage of the controversy:

"I wrote your firm in March about this trouble, and you *apparently* met our organization's wishes for a few weeks, but it was only temporarily, as you have since my letter treated Executive Board of Local Assembly 1727, K. of L., very ungentlemanly and the wishes of our organization with utter contempt. Now we come to the conclusion it is a waste of time to write a firm or express our wishes, who have treated us as you have my letter and the wishes of our organization. So we have proceeded to protect ourselves by bringing the wishes of our organization in a more forcible way to your office than by letter or sending our Local Executive Board. We have notified all our friends at [here follow the names of forty-two cities in various parts of the country] and very many other important points left unnamed, and we know only too well your firm will be willing to meet the just wishes of our organization before three months. We have spent the money of our organization for results and will get them."

In nearly every instance in which this letter was received the threatened firm was weak enough to yield, through fear of the boycott held over its goods in case of refusal. In frequent cases the names of customers in various cities were put into the threat in order to show what power the national organization possessed. It appeared in the testimony that these names had been procured by compelling members of the local assembly of Knights, who were clerks of the firms, to get possession of them in one way or another. Of course, the immediate effect of yielding was to make matters worse than ever. In fact, Hughes did not appear in full glory until he had won his first concession. He immediately put in a bill of expenses for the trouble caused to his organization by the first refusal, and also for the cost he should be put to to stop the boycott which had been got under way. In this manner he made one firm pay $1,600, another firm $1,087, another $1,000, and so on. Sometimes there was a long correspondence with the great Hughes over his bills, resulting in reductions, though only after violent protestation on his part.

Of course there was only one result of a controversy with a man of this character. Every demand that was granted was followed by others more insolent, until all possibility of conducting their business at all was removed from the manufacturers, and they decided to stop. It should be borne in mind that the employees themselves had never complained of their treatment by their employers; they did not object to the apprentices, and they were eager to do the extra work offered them. The employers had abundant work on hand, more orders, indeed, than they could fill, and they were willing to pay union wages for all the extra work the men could do. Furthermore, none of the Knights who made the trouble were ever in the manufacturers' employ. Only one of them, Thein, was even a resident of Rochester. Hughes lived in Chicago, Westbrook in New York, Wright in Philadelphia. There is no evidence to show even that any of them were really members of the craft which they were "managing" into discontent and idleness. It is no wonder that when the investigation was concluded, Hughes, Westbrook, Wright, and Thein were indicted for conspiracy and extortion, placed under arrest, and taken to Rochester for trial. Neither is it surprising that the Board of Arbitration, in presenting the evidence to the Legislature, should say that the "Boycott, as its workings are developed in this case, does not conduce to harmony between the parties, and is not calculated to improve their present or any other system of production. On the contrary, it would seem that, sooner or later, the consequence must be disruption of relations and destruction of industries. Like causes produce like effects, and the spectacle presented in Rochester to-day may be witnessed in the other industrial centres of the State to-morrow."

But Hughes is still unsubdued. He issued on Friday a proclamation to all Knights in the land, calling upon them to boycott the manufacturers everywhere by warning local retail clothing-dealers not to handle their goods. The reason for this step is that the manufacturers are about to resume business in their own way, and are even thinking of doing so with new men, refusing to reemploy some of the old ones whose extreme Knightly conduct aggravated their past difficulties. In his proclamation Hughes speaks of himself and indicted associates as being temporarily in the "hands of the paid emissary of this unjust combine, the Rochester District Attorney." His proclamation is very cheap bravado, amounting to the familiar Powderly performance of declaring, at the moment when the failure of a strike is assured, that the "strike is still on."

TWO IMPORTANT ART EXHIBITIONS.

LONDON, March 16, 1891.

MR. HAMERTON, in one of his essays, speaks of the influence of fashion on the arts of drawing and book-illustration. But I do not think that he has pointed out in this connection the curious fact that while illustration never has been quite as popular as it is nowadays, there is nothing to which the public is apparently so indifferent as the original work, which they know and prize in the reproduction. Black-and-white exhibitions languish; the black-and-white room at the Royal Academy is always all but deserted. The drawing of a master has but small chance by the side of the real oil-painting of the veriest tyro. But, fortunately for the few who do care and know, two very important shows of drawings, some mere notes and memoranda for the artist's own use, others made for reproduction and publication, have just been opened in London. These are, the exhibition of drawings illustrative of European art acquired within the last five or six years by the British Museum authorities, and now hung in the new White building, and the collection of Charles Keene's work brought together in the Fine Art Society's galleries. While the latter will remain open but for a few weeks, the former will in all probability continue for a couple of years, and Americans coming to London during that time should on no account miss it.

It is to be regretted that the rare series of Japanese and Chinese work has had to be put away to make room for the examples of European art at the British Museum. But still these occasional changes in the permanent exhibition, the only means by which many of the Museum treasures could be shown to the public, have their value. The present selection is of such unusual interest that it certainly should not have been allowed to remain carefully hidden out of sight, though it is scarcely as representative as it aims at being. Divided into three sections—Early and Renaissance Schools, Seventeenth and Eighteenth Century Schools, and Modern Schools—it is really in the third of these divisions, by far the most important for the draughtsman of to-day, devoted all but wholly to British drawings, which, however, include but few examples of the period when English draughtsmanship was at its greatest. Delightful and valuable as are the drawings of the old Italian masters, the delicate pen-work of Mantegna, the vigorous studies of Signorelli and Michael Angelo, the refined designs of Gozzoli and Peruzzi, these, of course, are but the merest notes and sketches for pictures, of no small interest in themselves, but without technical value for the modern draughtsman who works for reproduction; and besides, one sees the same studies in all the large Continental galleries, in many to far better advantage. Indeed, in this first section there is nothing of very marked distinction—that is, nothing that calls for special comment—except a pen drawing by Albert Dürer. This deserves careful examination, for it throws some light on a much disputed point in regard to his work. It is evidently a drawing prepared for the woodcutter; looked at closely, you can see that it has been traced, probably on to the block; the word "Apolo" on it is written backward, in order, without doubt, that it may be properly reversed in the printing; but the most noteworthy feature is the extreme delicacy and refinement of the pen line—far more like Dürer's etched line than the line in his woodcuts. It is instructive to contrast this original design with some of the printed blocks from his work down stairs in the King's library. A draughtsman with such a style and such methods would (despite William Morris and Walter Crane and the latter-day worshippers of primitive engraving) have greatly preferred to be reproduced by process, which would have retained much of his delicacy, than by wood-engraving, which cut it almost all away. That he was not his own woodcutter, as the faithful would have us believe, this drawing proves most unquestionably.

Noteworthy, too, in the same section, is the work of Cerceau, the French architectural draughtsman, which shows that in his time architectural drawings were set up exactly as they are nowadays, while it is seldom that one sees such beautiful studies of decorative detail.

In the seventeenth and eighteenth-century schools Rembrandt stands supreme. There

are here fine pencil studies for portraits by Rubens; delightful impressions of landscape by Vandyke; charming little heads and graceful figures by Watteau and Boucher; the marvellously elaborate drawings made by Dunker and Freudenberger for the steel engravings illustrating Margaret of Navarre's 'Heptameron'; pencil sketches by Lely which have far more character and power than his finished portraits in oils; good strong notes by Reynolds and Gainsborough; two fairly typical Blakes. But there is nothing equal in artistic importance to a little drawing in soft pencil of an elephant by Rembrandt. This is really the gem of the whole collection. It is done with the utmost simplicity, there is hardly any work in it at all, and yet it is all there; you can feel the quality of the elephant's tough hide and see its heavy folds. The drawing is a masterpiece. Wonderful, too, are three others in sepia—two small landscapes with the distance as exquisitely suggested as in his etchings of similar subjects, and a rich Good Samaritan at the door of the inn.

It is, as I have said, in the third section, covering our century, a period which there are not so many opportunities to study, that the exhibition is least satisfactory. The British Museum authorities have been complimented because they have realized that there are draughtsmen outside of Great Britain. But this realization has not carried them very far. A couple of charcoal studies by Millet, several examples of Ingres and pencil sketches of architecture by Méryon, very nice but not very marvellous in themselves, though interesting as coming from him, and two Maori heads by the same artist, which are Méryon rather than Maorian, complete the foreign selection. There is nothing of Menzel, nothing of Meissonier, nothing of Fortuny. The great masters who made the drawing of to-day what it is, might as well never have worked, for all the representation they find here. I understand that the appropriation made to the Print Department is not large, and Mr. Colvin, the keeper, is somewhat limited by his purse. But a little more discrimination in the selection of work would have gone far towards counterbalancing this difficulty. Instead of endless and indifferent examples of greatly overrated Englishmen, instead of wearisome series of hopelessly dull and commonplace English water-colors, one or two typical drawings by the true modern masters of draughtsmanship might profitably have been substituted.

Conspicuous among the good things that one would most certainly retain, are beautiful sketches by Constable, some in color, others in black-and-white; big, expressive architectural studies in pencil by Prout—these, with the sketches of William Leighton Leitch, showing how much more carefully men did this sort of work before the introduction of photography; and Alfred Stevens's designs. But if the leading foreign draughtsmen are unrepresented, so, too, are the most notable English artists in black-and-white. There are plenty of Hablot Brownes, Cruikshanks, and Caldecotts, men of greater popularity with the public than with their fellow-artists. But of Keene, Sandys, Pinwell, the little group who made the *Graphic* and English illustration of some thirty years ago, there are absolutely no examples, and yet it is to them the modern British school of drawing owes whatever prominence it may have. Their absence is in a measure due to the fact that the work of living artists is not included in the collection; and of these men few are dead, though, perhaps because they are living in neglect and poverty, like Sandys, or have long since ceased to do good work, like Millais, they are not known to the present generation as draughtsmen. But there is no excuse now for not giving the drawings of Charles Keene the space which they so largely deserve.

It is a happy chance which at this juncture has led the Fine Arts Society to open the show of Keene's work. In their gallery the study begun at the Museum can with profit be continued. Keene is unquestionably the greatest English draughtsman who ever lived, though it was only by a very small saving remnant that his greatness was appreciated. A man of over sixty when he died, the Royal Academy had ever been closed against him; he had never enjoyed the notoriety of other *Punch* men; he was never seen in the galleries, except of late years in one or two shows of the New English Art Club, of which he was an honorary member. It was to the Continent he had to turn for whatever honors his work brought him. His death may be said to have attracted public attention to him for the first time, and fortunately the exhibition of his drawings is being held before he is again forgotten. The greater number of these drawings are, of course, his contributions to *Punch*, well known in a way, and yet not known at all, so much have they lost in the woodcutting. In the gallery there is a portfolio containing some of his earliest pen-and-ink work which it is interesting to compare with his later productions, for he seems in the beginning to have drawn with a delicacy and refinement of line only equalled by Whistler in his etchings. There are delightful studies of figures, of interiors, of landscape, of boats, which no etching could surpass, and which show what we might have had from him had he worked for process. Working for woodcutting, he soon realized that one thing it could not do was to render the extreme refinement of his line, and he somewhat altered his methods, though he never subordinated himself to his woodcutter. Later on, as if he saw how hopeless it was to expect exact reproduction, he used greater freedom again, drawing in any colored ink and on any kind of paper; some of the drawings are made on the backs of advertisements. The cuts in *Punch* but faintly reflect the originals; indeed, often there is not even an attempt to follow his lines.

All his drawings, however made, show the same careful study, the same originality in conception and execution, the same style—in a word, the same indefinable artistic quality which always distinguishes the work of the master. No one knew better than he how to suggest all the character of the landscape in the fewest possible lines; no one understood more thoroughly what are the essential features of a London street or a shop interior. His figures are masterpieces of modelling, and even the poorest reproductions cannot altogether destroy the simply expressed but strong individuality of his Robert, his cabmen, his delightful drunken gentleman, his fat lady, his street urchin. It has been made a reproach to him that he never sought to render beautiful or merely pretty types. As well might Rembrandt or Velasquez be taken to task for painting many of the portraits which are the triumph of their, and indeed of all, art. Charles Keene drew the life he saw and knew best; and therein lies the secret of his greatness. It is to his lasting credit that in these days, when art is upon the town, as Whittier puts it, he never sacrificed artistic achievement to popular taste for the sake of the all-powerful initials R. A. after his name, or of a palace in Kensington or St. John's Wood.

The Keene exhibition has made a great stir among artists, who have been the chief buyers of his drawings; but I doubt if it prove popular with the outside public. As for the new show at the British Museum, it is pitiful to see the mere handful of people who attend it in the evenings, despite the electric light, which gives artists and artisans, busy during the day, a chance to enjoy it after dark. But this is only additional proof of the prevailing indifference to the art of drawing, save in its reproductive forms. Perhaps if people were not so ignorant of the methods of reproduction, this indifference might not be so great. But it is astonishing to find how little the average mortal knows, and how much less he cares to understand, the processes which give him, in his periodicals and books, the artist's work. A curious instance of this, just now brought notoriously before the public, is to be had in Prof. Herkomer's "Idyl," very recently published. "Illustrated by Sixteen Etched Plates," by the Professor, is announced in the circulars and by the publishers, and yet it has been seriously questioned in the *National Observer* (and other papers are following its lead) whether these illustrations are etchings or photogravures. To any one who examines them carefully, there cannot be much doubt. Now, if people were more intelligently interested in the illustrated books which they buy, a deception—to call it by a polite name—of this kind would not be possible. Unfortunately, however, the poor ignorant public is not here entirely to blame. Part of the responsibility rests with Mr. Hamerton, who for the last few years has been telling us but too often that a photogravure is an etching. Publishers have not been slow to take the hint. In the Temple Library, photogravures have been advertised and sold and criticised as etchings with the greatest success. But when it comes to the least doubt being thrown upon the artistic and commercial veracity of a man of Mr. Herkomer's position, it is time indeed to protest. If such exhibitions as the two I have described would but draw attention to original work, one might hope that in the course of time people would begin to interest themselves in the methods by which this work is given to them in its printed result. N. N.

TALLEYRAND'S MEMOIRS.*—II.

PARIS, March 9, 1891.

TALLEYRAND is not mistaken when he attaches great importance to a decision taken by Marshal de Ségur. At a moment when the doctrine of equality was making daily progress, the Marshal decided that commissions in the army should be reserved exclusively for noblemen. Fabert, Chevert, Catinat having been plebeians, the petty officers of the army were outraged by this measure; they furnished afterwards the generals of the Revolution and the marshals of the Empire. The spirit of caste was the true agent of destruction of the old régime, and a philosophic observer would trace its influence throughout the history of France, even to the present period. Nobility no longer confers any material privileges, but it creates what the philosophers call an *état d'âme* absolutely hostile to the democratic ideal. For a hundred years there have been, so to speak, two nations in the nation, and the final reconciliation has not yet taken place.

The Comte d'Artois gave the signal for the emigration. Talleyrand says of him, "I loved him. I needed all the force of my reason not to follow him." He refused, however, to join the Count in Turin. He did not blame the *émigrés*, he blamed the emigration. Talleyrand took a not unimportant part in the dis-

* 'Memoirs of the Prince de Talleyrand.' Vols. I. and II. G. P. Putnam's Sons.

cussions of the famous Constituent Assembly. When the Assembly made a constitution for the clergy without any previous understanding with the Papacy, almost all the bishops refused to take the oath of adherence to what was called the "civil constitution of the clergy." The new bishops were anxious to have the episcopal consecration; Talleyrand consented to consecrate one of them, who afterwards consecrated the others. He himself resigned the bishopric of Autun and abandoned the Church for ever.

I follow in the memoirs of Talleyrand the thread of the events in which he was concerned, leaving aside many considerations or questions which have now lost their interest. This thread of events is often interrupted. Talleyrand did not make a diary; he depicted only certain periods of his existence. He says hardly anything about the mission intrusted to him in 1792. He went to England with the Duc de Biron on the 12th of January, and returned to Paris on the 9th of March. After the famous 10th of August, 1792, he felt that he was no longer safe in France, notwithstanding the services he had rendered to the Revolution. He asked to be sent on a mission to England, on the futile pretext of studying the weights and measures (a question which had occupied him in the Constituent Assembly); he really wished to leave France with a regular passport, and he succeeded. He remained in England during the whole of the "effroyable" year 1793 and a part of 1794. He was very kindly received by the Marquis of Lansdowne, whom he had known in Paris. He did not wish to remain long in England, and his stay was shortened by an order of expulsion. He went on board the first ship that was leaving for the United States. A tempest obliged his ship to take refuge in Falmouth, and Talleyrand found himself for a day in the same inn with Gen. Arnold. "I am perhaps the only American," said Arnold to him, "who can give you no letters for his own country." Arnold withheld his name from Talleyrand.

Talleyrand landed in Philadelphia, and made a journey with M. de Beaumetz, a French émigré, and a Dutchman named Heydecoper. He was not given to the descriptive style, like the modern traveller; his observations had reference to manners. In Mrs. Robert Morris's drawing-room he admired an elegant *guéridon* of Sèvres porcelain; on this table was the hat of the master of the house—"a hat which a European peasant would not have liked to put on his head." In a log-house in Ohio he saw a piano adorned with the most beautiful bronzes. It is clear that he admired the simplicity of America more than its luxury. I have it from a person who had known him that, when he spoke of America, he always said, "Its *luxe* is horrible." Talleyrand did not see Gen. Washington, though he had a letter of introduction to him written by Lord Lansdowne; he made the acquaintance of Gen. Hamilton, of whom he says that, "by his mind and his character he seemed to him to be, even in the lifetime of Pitt and Fox, on a level with the most distinguished statesmen of Europe."

After thirty months spent in America (without any other desire than not to be in France or in England), he received a decree of the Convention which authorized him to return to France. He embarked on board a ship which was going to Hamburg. His prudence led him not to return directly to France. When he was still at the mouth of the Elbe, he received a message from Madame de Flahaut, who was at Hamburg, who urged him not to land, but to return immediately to France. They had been very intimate in old times, and she feared that his return might be an obstacle to her intended marriage with M. de Souza, the Minister of Portugal. Talleyrand did not mind this ridiculous message, and he remained a month at Hamburg, where he found Madame de Genlis such as he had seen her in the time of her glory. Madame de Genlis gives an account of her intercourse with Talleyrand at Hamburg in her interesting and too much neglected memoirs. They recalled to each other the delightful evenings they had spent in France with Mademoiselle (the sister of Louis Philippe) and her own niece Pamela. Talleyrand came to her little *soupers* in Hamburg, and ironically spoke of their "estimable frugality." "One night," says she, "I gave a great supper, perfectly well served, to which all our friends were invited. Talleyrand, seeing this magnificent repast, whispered in my ear: 'I promise you I will not appear astonished.' It would be impossible to be more amiable than he was at that repast."

Talleyrand went from Hamburg to Amsterdam, thence to Brussels, and arrived in Paris only in September, 1796. Mme. de Staël became his Providence in the new society which had emerged from the Revolution. She pressed him to make the acquaintance of Barras, and, after some reluctance, he accepted an invitation of Barras to Suresnes. While he was waiting for Barras, a young man of whom Barras was very fond drowned himself in the Seine, and Talleyrand's first interview was much disturbed by this unfortunate incident. "From that moment I never had any complaint to make of Barras. He was very passionate, all animation and impulse; I had known him for scarcely two hours, yet I might have thought I was, so to speak, the person he loved best in the world."

Some time afterwards, the Directory made a change in their Cabinet, and Barras insisted upon the nomination of his new friend as Minister of Foreign Affairs. A gendarme brought the offer to him; Madame de Staël urged him to accept, and he did so. "I know," he says, "that some persons, not then, but since the Restoration, have discovered that it was wrong to take office in a time of crisis and revolution, when it is impossible to do any absolute good. It always seemed to me that this view was very superficial. In the affairs of this world, you must never stop at the present moment. *What is* is almost always of little consequence, when one does not remember that *what is* will produce what *will be;* and, in truth, in order to arrive at an end, must you not start? . . . People are not always led by personal calculation when they accept office, and I might say that it is a great sacrifice to consent to become the responsible editor of the work of other people. Selfishness and fear have less abnegation." I give these reasonings, or sophisms, for what they are worth; they are certainly very characteristic of the man who served so many governments and always succeeded in conferring more favors than he himself received.

At the first sitting of the Directory at which Talleyrand appeared, a quarrel arose between Carnot and Barras. "The latter accused his colleague of having suppressed a letter which ought to have been placed under the eyes of the Directory. They were both standing. Carnot lifted his hand, and said: 'I give you my word of honor that it is not true.' 'Don't lift your hand,' answered Barras; 'blood would drip from it.' Such were the men who governed France, and with them I had to try to make France reënter European society. I threw myself into this great enterprise." The victories of the Directory, and especially those of Gen. Bonaparte, made this task somewhat easy. Talleyrand, on assuming office, wrote immediately to Bonaparte, and a correspondence between them was established. Talleyrand saw in the young general who signed the treaty of Campo Formio (October 17, 1797) the man of genius, the man of the future.

As soon as Bonaparte returned from Italy, he sent an aide-de-camp to Talleyrand announcing a visit from himself. The first conversation was extremely friendly and confidential. Bonaparte said, among many other things: "You are the nephew of the Archbishop of Reims, who is with Louis XVIII." If he dreamed a moment of playing the part of Monk, the dream was not of long duration. It is clear that Talleyrand did not, after the execution of Louis XVI., believe in the possibility of the Restoration; he thought that a transition was necessary—a temporary monarch, and perhaps a new dynasty. What he called the *polygarchy* of the Directory could not last, and did not deserve to last. The Consulate was, in reality, the preface to the Empire. Talleyrand understood at once that France wished to preserve the fruits of the Revolution, but to be rid of the revolutionists. These had been the instruments of destiny; Bonaparte was the strong man desired by the nation, who owed everything to the Revolution, and who could organize the new society which had sprung out of it. He was the man who could force Europe to recognize this new order of things, and defend it against everybody. Napoleon understood all this even better than Talleyrand; he did more than understand it, he was unconscious—he was like a living force of nature; his passions were as lucid as Talleyrand's intelligence. He felt that he was the natural master of the new France, and that in order to remain its master, he must be the master of Europe. Talleyrand represented the traditions of old France, and he placed his immense knowledge and extraordinary ability at the disposition of the man who was ready to remodel Europe as France had been remodelled.

Correspondence.

HOW OUR PENSION LAW WORKS.

To the Editor of The Nation:

Sir: A German who had served in our army during the Civil War, but is now living in perfect health at Poessneck in the Duchy of Sachsen-Meiningen, was recently informed by the United States Consul at Sonneberg that he was entitled to a pension, not only from the present date, but also for the twenty-seven years that have elapsed since he left the service. This back pension amounts to more than $6,000. After his death the pension will be continued to his widow during her lifetime.

Another German enlisted in the United States cavalry from 1852 to 1855, when he returned to his native land and was appointed to a petty office under the Bavarian Government at Lindau. About a year ago he was surprised to receive a letter from a pension lawyer in Cleveland, Ohio, asking him whether he had never taken cold while on duty on our Western frontier, and whether this cold might not have induced some affection of the lungs, liver, or heart; adding that in such case he would be entitled to a pension. The man, having his memory thus jogged, recalled several instances of this sort, and presumed the cold might have injured the internal organs mentioned. He accordingly filled out the papers which the lawyer had sent him, and now

draws his pension. He has never been an American citizen and never fought in a single battle while in the United States service. He is a Bavarian subject, and was pensioned not long ago by the Bavarian Government on account of his age. But, as he remarked to the writer, his pension for thirty years' service under the Bavarian Government is a mere bagatelle compared with that which he receives from Washington for three years' bloodless service in the United States cavalry. He frankly admitted that he never expected a pension and was perfectly satisfied with the pay he received as a soldier; but why should he refuse the money thus thrust upon him? The above is by no means an isolated or exceptional case; and the money to pay for such "fooling" comes out of the pocket of the American citizen. E.

MR. PHELPS ON DIPLOMACY.

To the Editor of The Nation:

Sir: In his recent article in *Harper's Magazine*, Mr. Phelps says: "A nation divided against itself can never achieve a diplomatic success." This can hardly be accepted as an axiom in diplomacy, as some of the most important treaties have been made by nations torn almost asunder by internal dissensions. The Hartford Convention of 1814 had but very recently closed its labors when the United States Commissioners secured all that their country demanded by the treaty with England ending the war of 1812—an issue due solely to the wisdom, patience, and patriotism of Gallatin and his associates, when the country was well-nigh exhausted by an unequal contest with a great Power and irreconcilable disputes at home. J. S. N.

Philadelphia, March 26, 1891.

A QUESTION OF CATALOGUING.

To the Editor of The Nation:

Sir: I recognize with pleasure your hearty appreciation of the excellent code of rules for cataloguing just issued by Mr. Linderfelt of Milwaukee; and, where criticisms are so few, it may seem ungracious to object to any of them. But I feel called upon to protest against your dictum that "Pratt (Enoch) Free Library" is the proper form for the entry of that title. Mr. Linderfelt says it should be entered in its "usual" form (meaning, of course, what the word "usual" naturally means, and not what it means in cataloguing usage), and he is undoubtedly right. I think it will be found that most American catalogues give such forms as Enoch Pratt Library, Johns Hopkins University, Leland Stanford University, without any transposition. See, for examples, Johns Hopkins, in the Astor Library Supplement, in the American Catalogue, 1876–1884, and in the Catalogue of the Library of the Surgeon-General's Office at Washington.

I am aware that Cutter's Rules (2d ed.) gives "Pratt (Enoch) Free Library" as an example, but I am inclined to think it is in the nature of an oversight, as this particular question is not discussed. Cutter's note (H. p. 32) on the names of firms is not at all conclusive on this point. W. I. F.

Amherst College Library,
Amherst, Mass., March 28, 1891.

THE EXCAVATION OF DELPHI.

To the Editor of The Nation:

Sir: I have not seen that any of your correspondents at Athens have called attention to the fact that, after all the negotiation and contribution of funds for the work which our School at Athens was to do at Delphi, the French School has got the concession even after ours had secured the funds necessary, as was supposed. This is the conclusion to which I have always looked as inevitable. I have urged the responsible authorities on our side not to enter into a competition which could only end to our disadvantage and which must produce unpleasant feeling; and I put forward the event which has ended the controvesy, viz., that the Greek Government would give the concession to France whenever she accepted the treaty negotiated in 1887, to which both parties were bound. I asserted that the Greeks were only using our propositions to get better terms from France, and that they never had any real intention of giving the concession to the American School. I stated, what now is seen to be the fact, that the French had never withdrawn their claims and did not mean to withdraw them, and on these grounds I urged abstention from a competition which exaggerated the pretensions of the Greeks, involved discourtesy to the French and alienation between the two schools, and which was certain to be decided against us. For this I have been attacked as unpatriotic, put in Coventry by the friends of our School, and made to pay such penalties as the outraged dignity of our archæologists could inflict. We have succeeded in making the French pay more than double what the Greek Government demanded at first, and when we come to the point with the money demanded in our hands, we have the humiliation of learning that we have only been made the tools of a crafty combination for the Greek advantage. There was never any intention of giving the concession to the American School. This I had the proof of in 1889, but the persons responsible would not believe me, and now we pay the penalty.

I am obliged to do justice to myself, and to this end I ask the publication of the above.

Yours truly, W. J. Stillman.

DR. WALDSTEIN ON THE GRAVE OF ARISTOTLE.

To the Editor of The Nation:

Sir: Contrary to my wishes, the news has already leaked into the papers here that I have discovered the grave of Aristotle. As I am very anxious that no sensational report be spread, not warranted by conscientious scientific investigation, I feel bound to make public at this juncture the grounds upon which this premature conclusion has been arrived at.

During the excavations which have been carried on by the American School of Classical Studies under my direction on the site of the ancient Eretria, I was making tentative excavations in the neighborhood of the city, in order to discover the temple of the Amyrinthian Artemis. I came upon beautifully worked marble foundations, which, however, proved to be the enclosures of a family grave, such as exist in considerable number about Eretria. But these walls were of such workmanship and magnificence that I concluded they must be the finest graves in the neighborhood. After much digging, and opening of two graves, we came upon one within this precinct which contained a number of articles (twenty-three), among them six diadems of pure gold and one laurel wreath of pure gold about the head; furthermore, a most interesting specimen of a writing-pen in silver, and two styluses of the same material. Also a statuette of a philosopher, with hands folded, in terracotta.

It seemed evident to me at the time that the person here buried was a man of literary pursuits, and furthermore a man of considerable fame and note. When, in the grave adjoining, containing the remains of a female member of the family, an inscription was found, [B]IOTH [A]PIΣTOTEAOY (Biote Aristotelou), the tempting question flitted through the mind, whether the gold-wreathed philosopher buried with such distinction was not the famous Stagirite? This grew still more tempting when one bore in mind that Aristotle died at Kalchis, and that Kalchis is the adjoining city to Eretria. Finally, Christodoros describes a statue of Aristotle which he saw in a gymnasium at Constantinople as "standing with hands folded together," which corresponds to the unique terracotta found in the grave. According to Prof. Richardson, the inscription goes back to the third century B. C.

This is an outline of the facts connected with the discovery. But I should like to point to the following points which militate against the identification: first, that Kalchis is not Eretria, though it adjoins it, though graves run almost continuously from Kalchis as far as Bathia, two hours beyond Eretria, and though one must not assume that these were the same distinct and inimical communities after the Macedonian period which they were in the previous centuries. One must further remember that there were several Aristotles in antiquity, and that the daughter of Aristotle by his wife Pythias is mentioned in his will, and that her name was Pythias, not Biote; though he might have had a daughter by Herpyllis. Finally, research has not yet considered and settled the question whether the terracotta figures in the graves had any such *direct* reference to the deceased as the statuette of the philosopher in the grave in question might tempt us to believe existed in this case; though we can, even now, maintain that a general relation subsisted, such as that of ephebi in graves of youths, children in children's graves, and women with articles of toilet in those of women.

These are, on the whole, the facts which I can at present make public. Perhaps more light may come to us.

Charles Waldstein.

Athens, March 12, 1891.

SOME GREEK PROOF-READING.

To the Editor of The Nation:

Sir: "What the author hath joined together let not the scribe put asunder" is a rule that is often violated, and many easy corrections may be made by restoring the original unity. But scholars are often very slow to avail themselves of the opportunity. One such correction, made long ago, has recently been confirmed by the discovery of the 'Ἀθηναίων πολιτεία.'

In the *American Journal of Philology*, i, 458 (1880), I proposed to read Solon fr. 36, 21 (Bergk)—

οὔτ' ἂν κατέσχε δῆμον οὔτ' ἐπαύσατο
πρὶν ἀναταράξας πῖαρ ἐξελεῖν γάλα

instead of πρὶν ἂν ταράξας πῖαρ ἐξέλῃ γάλα. "Of course," I added, "we might also have ἐξελεῖν as in Eur. *Alc.* 362," where πρὶν καταστῆσαι occurs after an unreal conditional.

In ignorance of my emendation, Mr. Adam, in his edition of the *Crito*, p. 44 D (1888), improved on it by reading ἀνταράξας, and added, "possibly ἐξελεῖν." In a letter to the *Academy* published March 14, Mr. Adam was swift to claim the credit of his anticipation.

The first edition of the 'Ἀθηναίων πολιτεία' had ἂν ταράξας . . . ἐξελεῖν. The second, among

the *corrigenda*, ἀνταράξας. . . . ἐξεῖλεν. "Auf ἀνταράξας," says Blass in the *Lit. Centralblatt*, Feb. 28, 1891, commenting on the first edition, "ist kein Mensch gekommen" (he might have added "ausser Adam"). "Da aber Negation vorausgeht, muss es ἐξείλεν heissen, was sich in Solon's Schreibung (ΕΞΕΛΕΝ) von ἐξελεῖν gar nicht unterschied." But I have already shown that ἐξελεῖν might stand perfectly well.

An odd persistence of a bad reading of the divorce pattern is to be found in Goodwin's 'Moods and Tenses,' in which for thirty years ἄν with the present ind. (Plat. *Legg.* iv, 712 E) has been explained by the anacoluthic shift. So in the revised edition § 195. In my copy of the edition of 1867 I changed, as a matter of course, ἂν ἐρωτηθείς into ἀνερωτηθείς, and this is the reading of Schanz's edition of the 'Laws' (1879).

In Pind. N 7, 68, μαθὼν δέ τις ἂν ἐρεῖ, ἂν ἐρεῖ has been corrected by Mr. Bury, in his recent edition, with a flourish of trumpets, into μαθὼν δέ τις ἀνερεῖ. The emendation is no great achievement; it is just what every proof-reader does every day without making any claim to superhuman insight; but, such as it is, it may be found in the *American Journal of Philology*, iii, 452, and in my Pindar, Introd. Essay, civ, so that it does not seem to me much more original than some of Mr. Bury's analyses of the Pindaric odes. And doubtless it has been suggested before my day. Comp. Aeschin. 3, 155.

Moral for young scholars. Be sure of your grammar. Be sure of your text. Don't brag.

B. L. GILDERSLEEVE.

MARCH 26, 1891.

Notes.

HOUGHTON, MIFFLIN & Co. will shortly publish a Life of Charles G. Finney, formerly President of Oberlin College, prepared for the series, "American Religious Leaders," by Prof. Geo. F. Wright of the same institution; 'Excursions in Art and Letters,' by W. W. Story; and John Fiske's *Atlantic* papers on the American Revolution.

'Jerry,' an anonymous novel that has been running in *Scribner's Magazine*, will be brought out at once as a book by Henry Holt & Co.

D. Appleton & Co. will shortly publish 'The Iron Game,' a story of the war, by Henry F. Keenan.

Thomas Whittaker announces a popular series of handy volumes containing biographies of "Men with a Mission" in English and American history. Kingsley, Stanley, Latimer, Lincoln, Howard, and Lord Lawrence are examples of the range of the series.

D. C. Heath & Co. will shortly issue a handbook of technical German called a 'German Science Reader,' by Prof. Gore of Columbian University. A vocabulary will much enhance its value.

Macmillan & Co. have in press a Life of Archbishop Tait, by Dean Davidson and Canon Benham; and a Life of Jane Welsh Carlyle, by Mrs. Alexander Ireland.

A volume of Sir Robert Peel's early letters, covering the period of his Irish Secretaryship and his first term as Home Secretary, edited by Mr. C. S. Parker, M.P., is about to be published by John Murray.

J. W. Bouton, No. 8 West Twenty-eighth Street, invites subscriptions to Portfolios I. and II. of Dr. Friedrich Lippmann's 'Engravings and Woodcuts by Old Masters,' reproduced in facsimile with rare fidelity by the Imperial Press at Berlin. There may be six or seven portfolios in all.

The manuscript of the second volume of Julius Froebel's 'Ein Lebenslauf,' the first volume of which was lately noticed in these columns, is already in the hands of the publisher (Stuttgart: Cotta), but will not appear until after the author's decease. It is a valuable contribution to the political history of Germany during the past thirty years by one who took an active part in it, and was intimately associated with the persons most prominent in directing the course of events. As Froebel, although eighty-six years of age, is still hale and hearty, it is highly probable that some time will elapse before the publication of the complete work.

Harper & Brothers make two pretty volumes, in the new series of their Franklin Square Library, of Mr. Howells's 'Hazard of New Fortunes' and 'Annie Kilburn.' From the same publishers we have a new local guide-book, 'New York and its Environs,' by Gustav Kobbé. It is orderly in its arrangement and discriminating in its selection, and compresses a great deal of information into less than 300 pages. There are three maps, of the city proper, of the environs, and of Central Park, and a few process illustrations. The foreign tourist has been kept specially in mind, and Mr. Kobbé takes him from the Battery northward to the Park. The new guide does not supersede 'Appletons' Dictionary of New York,' but the stranger will do well to own both these inexpensive volumes. Mr. Kobbé invites corrections, and we will suggest some minor ones: the placing of a semi-colon after "Manhattan," in the eighth line of p. 11, will remove the implication that this island, like the three following, is "occupied by the U. S. Government." In the last line of p. 179 Mr. Stanford White's name should be brought into conformity with the proper spelling of it on p. 177. And in the preface, p. 10, we should read "itinerary" for "itineracy."

Mr. M. M. Ballou's publishers, Houghton, Mifflin & Co., have made a tourists' guide-book of his 'New Eldorado: A Summer Journey to Alaska,' which first appeared and was favorably reviewed by us in 1889. Certain errors we then pointed out have been allowed to stand, and we believe there is no change in the work except the insertion of maps.

We have received from Charles E. Merrill & Co., 52 Lafayette Place, the first two volumes of the first authorized American edition of Ruskin's works. It is called the Brantwood edition, and its authenticity is vouched for by the introductions furnished by Prof. C. E. Norton. This friendly service has been made difficult by Mr. Ruskin's almost contemptuous self-criticism and recantation in his latter-day notes to the 'Seven Lamps of Architecture,' one of the volumes before us; the other being the lectures on art to which the collective title of 'The Two Paths' was given. The volumes are duodecimo in form, with good print and unostentatious binding. The 'Lamps' has fourteen plates.

The April number of the *Pennsylvania Magazine of History and Biography* is almost wholly occupied with the period of the Revolution. Dr. Stillé's new Life of John Dickinson is briefly noticed by Mr. Henry Flanders. Mr. William S. Baker, besides continuing his very valuable "Itinerary of Gen. Washington from June 15, 1775, to December 23, 1783," edits a MS. of Elias Boudinot touching the exchange of Maj.-Gen. Charles Lee. Of this eccentric character a curious caricature by Kosciusko is given in facsimile. Some letters of Franklin, bearing his stamp, are printed for the first time. Mr. S. W. Pennypacker treats at some length of the University of Pennsylvania in its relations to the State. We mention finally a summary of the winter seasons in Pennsylvania from 1644 to 1835, compiled from books, papers, and other sources.

The current issue (No. 57) of the Proceedings of the U. S. Naval Institute at Annapolis contains a very interesting account, by Lieut. W. W. Kimball, of the so-called "experimental ammunition cart" invented by himself for the Ordnance Department. Several plates show very clearly how a two-wheeled cart drawn by a horse is resolvable at will into two single-wheelbarrows, propelled by two men, with automatic-delivery action. After the battle, these barrows can be used for transporting the dead or wounded. The mechanism is as simple as it is ingenious.

In the last *Petermann's Mitteilungen* Prof. Woeikoff gives some of the results of a Russian expedition in the summer of 1890 for the exploration of the Black Sea. The greatest depth observed was 2,618 metres not far from the middle of the southern coast. Its mean temperature is surpassed only by the Red Sea, the Mediterranean, and the Sulu. There is very little life to be found at a greater depth than 180 metres, while the bottom of the deepest part is covered with the remains of organisms which are assumed to have existed before the breaking through of the Bosphorus and the introduction of the salter water of the Mediterranean. The electric light was used to test the transparency of the water, which was found to be greatest in the northern part. There is also an account of a trip in Somali-land in which the writer speaks highly of the progress made by the English in developing trade with the tribes of the interior. This has been done by protecting the great caravan-routes and indemnifying for losses by robbers. Within the past few years trade has greatly increased and well repays the cost of garrisoning and governing the Somali coast. Dr. Mitzopulos contributes a list, with some descriptive details, of seventy earthquakes observed in Greece and Turkey during the year 1890. From this it appears that the greatest number, fourteen, occurred in July, thirteen in April, and eleven in February. November was the only month free from shocks, and in December there was only one. The worthy Doctor naïvely remarks at the end of his communication, that "it is to be hoped that next year our catalogue of earthquakes will be *larger* and more exact"!

The current Proceedings of the American Antiquarian Society (vol. vii., part i.) is exceptionally varied and readable. We can instance only Mr. Samuel A. Green's paper on the disputed boundary between Massachusetts and New Hampshire, in the defining of which the latest Commission could only agree as to the portion between the sea and the Merrimac River; Mr. Charles C. Smith's paper on "Financial Embarrassments of New England Ministers in the Last Century"; and President Stanley Hall's graphic "Boy Life in a Massachusetts Town," a valuable summary of New England domestic, industrial, and social ways within the memory of people yet living in Berkshire County, Mass. Dr. Hall, who draws largely for his picture upon his own experience, tells a number of racy Yankee stories.

Following close upon the completion of the fourth edition of 'Meyers Konversations Lexikon' (Leipzig: Bibliographisches Institut; New York: Westermann) comes a yearly continuation for 1890, forming an eighteenth volume. Except that topics of the day will naturally receive greater stress, the supplement differs

in no essential respect from the main work. The minute watchfulness of the editing is shown (in the two parts before us) by fresh entries under Samuel Adams, J. Q. Adams, and Mrs. Stowe, in order to mention the atest biographies of these personages. New articles are given to Dr. Herbert B. Adams, Edward Bellamy, and S. G. W. Benjamin—to choose again only American examples. The three chief congresses of the year, viz., the Americanists, the Anthropologists, and the Berlin Labor Conference, are treated with much fulness, the last occupying twelve pages, to say nothing of other labor articles, and of a long one on the condition of the poor, with special reference to Germany. The exhibitions are treated under one head. Noticeable also are the articles Aluminium, Archæological literature (1885–1890), Argentine Republic, Railroad Depots (with plates), Population historically considered, Bacteria, and Bismarck. Part ii. ends with Böhm-Bawerk, who, it seems, has just entered his forty-first year. Apparently six or seven parts will make up the volume.

The questionable system of admitting students to college on "certificate" has spread so far that, we believe, it includes every college in New England except Harvard and Yale. The system prevails, if possible, more thoroughly among Western colleges than among Eastern. Adelbert College of Western Reserve University, at Cleveland, has not determined to receive no more students by certificate, but it offers rewards for passing its entrance examinations sufficient to induce first-rate students to take these tests. It offers $100 to the student who passes the best examination in all subjects next June, and $50 to each student who passes the best examination in Greek, Latin, Mathematics, and English respectively.

The Department of Library Economy in the Amherst (Mass.) Summer School will be conducted by Mr. Wm. I. Fletcher, the librarian of the College, from July 7 to August 10. There will be daily lectures in the afternoons, and the class will be treated as if beginners. Forenoons will be devoted to practice work under Mr. Fletcher's supervision. The fee is ten dollars for the course, in regard to which Mr. Fletcher may be addressed at Amherst, and Mr. Elmer P. Smith in regard to board.

Professor George Hempl of the University of Michigan writes us from Ann Arbor: "Can any of your readers inform me whether anywhere on this continent there still exists a difference in the pronunciation of *know* and *no;* in other words, has initial *k* before *n* left any trace?"

—The April *Atlantic* offers nothing else so high in quality as Mr. Parkman's second article upon the siege of Louisbourg in continuance of the extraordinary history of that achievement of the New England militia, and in these pages is found in abundance the local coloring which lends such contemporaneity and vitality to the author's works. A second historical paper deals with the tale of Arnold Winkelried, with the purpose of discovering whether this Swiss hero is as mythical as Tell, but the writer comes to no definite conclusion. Mr. Benjamin's paper on the Armenians attempts to show the relation of the people to the Turkish Government, and gives some reasons why they have more to gain from submission to a rule which he declares not a harsh one than from revolt and the ambition to become an independent state for Russia to swallow up. Mr. Percival Lowell describes some good mountain-climbing in Noto, and Prof. Wright contributes a geological history of the Pacific slope, with some concluding pages on the antiquity and genuineness of the prehistoric relics of man found under Table Mountain. Miss Burt, whose propagandism of reform in the matter of juvenile education we have several times had the pleasure of noting, makes a very effective contrast between the stories which children are now compelled to read in their reading-books and those which might be drawn from the myths and poetry of good literature as well adapted to interest the young and to stimulate their minds. More unfit reading than the pieces which she quotes cannot be found: they represent the lowest point of written speech possible to man; and if all that were needed were to show the need of a change, her work would be done. The real difficulty is that the teachers are generally as ignorant of the resources of good literature as the untaught children themselves, and have not the original mental force required to make the experiment unless their text-books are changed. Mr. Clinton Scollard's poem deserves a welcome as an attempt to write something better than the flimsy little lyrics and trifling verses to which our younger poets have mainly given themselves. The blank verse is in places melodious and full, but does not flow continuously, owing mainly to its being chopped up into too short sentences or phrases that break the rhythm of the lines. In fact, the blank verse is that of two different styles—Tennyson's and Aldrich's—imperfectly fused; but technical mastery will come with practice to any poet with an ear for melody even in this most exacting form of poetry.

—The *Century* contains a few pieces by Mr. Lüders, whose recent death put an end to his promise, and among them the first poem is remarkable for the successful attempt to write an unrhymed lyric so musical that the rhyme shall not be missed. Collins and Tennyson are the most admirable composers in this difficult form, and in the present piece it is easy to see that the melody is wholly the latter's; but it is an excellent imitation, and the earlier part has original poetic value in the sentiment. The literary article upon the Wordsworths and De Quinceys is belated, coming after the publication of the matter it contains in the memorials recently noticed by us at length. In the two papers upon Mt. St. Elias we have a much fuller treatment of this geographical subject than was lately given by *Scribner's*. The California historical articles have the usual large space assigned them, and the same interest as ever; and the French Salon papers, illustrated by several striking portraits, are of the ordinary sort. In the way of illustrations, Mr. Cole's reproduction of Leonardo da Vinci takes precedence of everything. An article on the fetishes of the African tribes also deserves mention for its definiteness and its curious interest.

—*Harper's* continues its army series with a lively account of the French Army by Gen. Lewal, accompanied by a number of spirited illustrations of the different branches of the service. This very solid paper is followed by another on the State of Wisconsin by ex-Secretary Vilas, in which he describes its history and resources with the State pride natural to the occasion, but with no unjustified claim-making. The bacteria are the topic of a third paper of similar weight; and the nature of these microbes, their culture in the laboratory, and the state of scientific knowledge respecting the species that are harmful to man, are set forth in an interesting and untechnical manner. At the close the spirit of hopefulness with regard to our greater control of disease in consequence of these investigations is noticeable. Dr. Waldstein contributes an account of the Meiningen Court Theatre, which he regards as the most significant product in the recent development of the stage; he describes its methods of training in some detail, and the modes by which its peculiar effects are obtained, and winds up with some very pertinent general observations on the excess of present writers, painters, and musicians in directing attention to the way in which they produce their work, instead of leaving the work itself after completion to be its own justification.

—*Scribner's* opens with a concise history of the "Ocean Passenger Service," containing an account, not too closely comparative, of the accommodations offered for both cabin and steerage travel by the great lines. Dr. Dwight's paper upon "Right-Handedness" is of extreme interest because of the variety of the scientific information included in it and the number of theories passed in review. The principal point made is the showing that right-handedness is only one incident in the general right-sidedness of the body with its correlation in the larger size of the left lobe of the brain. Dr. Dwight includes also a discussion of the symmetry of the face and the parallelism of the fine markings on the finger-tips—a trait sometimes used for the identification of criminals. More important, however, than either of these interesting articles is that on the Indian outbreak, of which the conditions and course are temperately told by Mr. Herbert Welsh, with the usual deductions of the need of a changed method of administration of Indian affairs; and with this in philanthropic interest stands the impressive story of the rise and growth of that charity of the Fresh-Air Fund, which from so humble a beginning has spread of its own power over a large part of this country and Europe. The instances of permanent good done by this Fund which the author, Mr. Willard Parsons, cites, are powerful and often touching, and show what great results for individual lives may flow from so small an expenditure as two or three dollars on a child's welfare. It is hardly possible but that this charity should grow rapidly and be plentifully supported by subscription. The worst fact brought out is that only one-third of the children examined are found fit to go into clean and decent homes, owing to their foul physical condition.

—Are the Memoirs of Talleyrand authentic? This question is asked with directness and much emphasis in the *Revue Bleue* of March 14. In the most prominent place in that number appears an article by M. F. A. Aulard, who sets forth the difficulties in the way of belief in the authenticity of the Memoirs with such clearness and logical force as must cause misgivings to spring up in every reader's mind. M. Aulard, who, since 1886, has been Professor at the Sorbonne of an historical course on the French Revolution, divides his article into two parts: in the first he takes up some difficulties that the preface to the Memoirs presents; the second he devotes to the consideration of some extraordinary historical blunders in the body of the book. In his preface the Duc de Broglie informs us that M. de Bacourt, to whom Talleyrand had committed his papers, took the pains to copy the Memoirs with his own hand and prepare them for printing. This copy forms four volumes, and its faithfulness is attested, for the first two volumes, by Talleyrand's niece, the Duchess of Dino, and for the third by a certificate by M. Bacourt himself. As to the fourth, M. de Bacourt died before he had finished copying the parts that make it up. It is from this copy that M. de Broglie has

printed his book, and he says, and is to be believed when he says, that he has made in it "no retrenchment nor modification of any sort." But is M. de Bacourt's copy exact? Does it conform to the original manuscript? Does the original manuscript still exist? Where is it? Has the Duc de Broglie compared it with the copy? All these are important questions—the very first that are asked when a text is in dispute. But M. de Broglie does not offer any answer to them. It is difficult to believe that he has had the manuscript in his hands and read it and yet neglected to mention the fact in his preface. If he is silent on this capital point, it may be that he has never seen Talleyrand's manuscript at all; and, if he has not seen it, it is most likely that he does not know where it is. The Duchess of Dino and M. de Bacourt were the most honorable people in the world; but the Duchess was by birth a De Courlande, imbued with contra-revolutionary prejudices, and might she not have thought it lawful to conceal from the public certain portions of her uncle's life on which she looked with horror? And as to M. de Bacourt, does the Duc de Broglie really hold him to have been always a faultless editor, and believe that, for example, he published in its full integrity the correspondence of Mirabeau with Lamarck? M. de Broglie is obliged to recognize the fact that great liberties have been taken even with the copy made by M. de Bacourt. In one place there is a lacuna where eight whole leaves have been torn out. This occurs at a delicate point, just where Talleyrand says that he is about "to make known with exactness the degree of consanguinity that existed between Louis XVI. and the Duc d'Orléans." Then, besides, there is the doubt that is raised by the stories that have been told about the robberies committed by Talleyrand's secretary, Perrey. Some account has been given of these in our columns, and remonstrance was also made by a correspondent, and a denial of them. But M. de Broglie, at least, appears to believe that Perrey carried away with him to England very important papers belonging to his master; and among these, it was said, was a considerable portion of the Memoirs—perhaps the most interesting part of all, the satiric portraits of more than a hundred of Talleyrand's contemporaries.

—So far we have followed M. Aulard very closely in his remarks upon the preface to the Memoirs. We must pass much more hastily over his strictures upon the body of the volume. He finds some ground for suspicion in the change in style which marks the beginning of the account of the Revolution. The account of Talleyrand's earlier life is a masterpiece of narration, quick, bright, alert; but as soon as the epoch of the Revolution is reached the pen becomes heavy, and the style dull, almost dead. In a letter to M. d'Hauterive, Talleyrand says that he has given in the Memoirs an account of the part he took in the Constituent Assembly, and he repeats this statement in the Memoirs themselves, but when the reader comes to the place where this account should be found, it is not there. In place of it appear some lines that "seem as if copied—and ill copied—from some biographical dictionary." The same observation, M. Aulard thinks, might be made upon the account of Talleyrand's entrance upon diplomatic life at the time of his journey to London. There are also mistakes that no man of the Revolution could have made, such as calling the Department of Paris the Department of the Seine. But the master-blunder is made about Carnot, whom the Memoirs represent as being a general in the year 1800, and as having been cruelly exiled to Cayenne! Over this *bévue* M. Aulard simply holds up his hands in exclamation marks. It is not at all M. Aulard's belief that the whole Memoirs are a cheat; much, the most, of them he believes authentic. But he believes that many false and spurious passages have been interpolated in them. Nor does he make any question of the good faith of the Duc de Broglie; that is above question. But he does find him lacking sadly the perspicacity which the editor of such a book as the Memoirs ought to have, and he thinks, too, that he is bound with as little delay as possible to inform the public exactly where the Talleyrand manuscript now is.

—It was rather because he was quite the last survivor of the great epoch of Romanticism than because he was a writer of smooth verse and of not unpleasing comedies, that the death of Théodore de Banville, which occurred in Paris on the night of March 12-13, calls for some brief notice. He was celebrating with his friends his seventy-first birthday (on March 14) when a stroke of apoplexy ended his life. He was brought up in the school of Victor Hugo, of Lamartine, and of Musset; they were the masters who taught him to write and to think. His first book of verse, the 'Cariatides,' appeared in 1842, and was followed by a score of others in prose or verse, the titles of which need not be set down here. Nor need we discuss, as some of the Paris journals do, whether he was more Goth or more Greek. To foreign eyes perhaps he seems to have been neither. Some relationship between him and André Chénier might, we should think, be made out, though he was unlike Chénier in a certain quality of virtuosity that appears in his verse. He was, in fact (as has been said), the first of the Parnassiens as well as the last of the Romanticists. Hence not so much a great loss to letters is widely deplored in Paris as the loss of a man who was much loved by many friends. Personally, Banville must have been very charming. Something of this is to be seen in the photographs of his pleasant face, and more is to be detected in the note of affectionate sorrow which lets itself be heard in all the notices of his death that we have seen. He lived very quietly, in lodgings, among friends and flowers and books, happy in his life, and also, perhaps, *felix opportunitate mortis*—for it must be a sad thing to be the last survivor of a dead school.

—The Independent Theatre of London gave its first performance on March 13. If one can judge of its future by the success of its opening venture, it bids fair to have as prosperous a career as the Théâtre Libre of Paris. Of course, M. Antoine's experiment is really responsible for this new departure in the London theatrical world. The object of the Independent Theatre, as of the Théâtre Libre, is to encourage the performance of plays which have a literary and artistic rather than a commercial value, to counteract the demoralizing influence of long runs, and to give young dramatists the chance to test their talents. There is no quarrelling with this object. If a draught of fresh air, as it were, was wanted to give new life to the French theatre, how much more is it needed to clear away the stifling atmosphere of sentiment and melodrama and convention that prevails on the London stage! The question of actor-managers, long runs, and concessions to the Young Person and British Matron has lately been gone into so thoroughly that it is useless to do more than refer to it. On the stage, where commercial success cannot be ignored, the initiative movement towards reform could not very well be expected. It had to come from outside. It is a significant fact that the leader of this movement is not an Englishman, but a foreigner. Mr. J. T. Grein, the founder and literary manager of the Independent Theatre, is a Dutchman, a journalist living in London, and an enthusiast in all that relates to the drama. He has succeeded in interesting a sufficient number of people to raise the money necessary for his venture. Like the Théâtre Libre, it is a private enterprise entirely; for though, as Mr. Grein plaintively explained, it is not his intention to defy decency and morality, it is likely that his and the Lord Chamberlain's standards of dramatic propriety may not always agree.

—Only members of the Society or invited guests can attend the performances of the Independent Theatre, and it was no easy matter to secure an invitation for the opening night. The play selected for this occasion was "Ghosts," the most powerful, though not perhaps the most dramatic, of all Ibsen's dramas. No actors of note took part in it, it was but indifferently well interpreted, and yet, we are informed, the power of the dramatist made itself felt. One might doubt the advisability of putting "Ghosts" on the regular bill at a popular theatre, but there was no denying that the experiment of actually producing it on the stage was intensely interesting. It alone would justify Mr. Grein's attempts at theatrical independence. Whether he will accomplish all that he hopes to for the English drama, however, is quite another question. The list of plays he announces in his répertoire are chiefly translations. Now, Antoine in Paris has not hesitated to produce the work of Russians and Norwegians and, indeed, all foreigners; but he has relied chiefly on the dramatic creations of Frenchmen—of Zola, Hennique, Catulle Mendès, the De Goncourts, and a host of others of equal literary distinction. But who are the Englishmen upon whom Mr. Grein must depend? Original plays have been promised, he says, by Messrs. George Moore, W. Wilde, Cecil Raleigh, J. Zangwill, C. W. Jarvis. And what hope does such a list hold out? It may be that the Independent Theatre will, in the course of time, develop the independent dramatist. But until it does, the real attraction of the English Théâtre Libre will be the opportunity it will give to see foreign plays which otherwise would never be presented to the British public.

THE GENESIS OF THE UNITED STATES.

The Genesis of the United States: A Narrative of the movement in England, 1605-1616, which resulted in the plantation of North America by Englishmen, disclosing the contest between England and Spain for the possession of the soil now occupied by the United States of America; set forth through a series of historical manuscripts now first printed, together with a reissue of rare contemporaneous tracts, accompanied by biographical memoranda, notes, and brief biographies, collected, arranged, and edited by Alexander Brown. With one hundred portraits, maps, and plans. 2 vols. Boston: Houghton, Mifflin & Co. 1890.

THE complete title of these noble volumes is accurately descriptive of their scope. The editor has labored with enviable success to make his work as complete a history as is now possible of the movement in England which resulted in the plantation of North America

by Englishmen; to give the narrative with the evidence, and the actors therein with their lives and portraits; to enable the reader to see the events and personages pass before his mind's eye almost as they passed before the Londoner of 280 years ago. The work is especially devoted to the period included between the return of Weymouth to England in July, 1605, and the return of Dale in June, 1616, or the period of "The First Foundation."

Mr. Brown's method is as follows: He first introduces the reader to the movements anterior to those of the years with which he is specially concerned, in a sketch of what had been done by Englishmen in the way of discovery and colonization prior to 1606. In this preliminary sketch he traces the motives which governed the Virginia companies when they first undertook to plant colonies in America. He makes London the scene of his narrative in order to enable the reader to observe events as nearly as possible from the centre of influence which guided them. He next rapidly accounts for the sources of information which now exist, and indicates not only their intrinsic value, but their importance relatively to such original records as have not been preserved. The material now available is shown to be, in part, of secondary value compared with the early records of the Virginia companies, which were kept under the supervision of some of the best business men of the time and were evidently very complete. In referring to these inaccessible records, Mr. Brown advises the reader that the story of American beginnings has been based almost entirely on the evidence of opponents or enemies of the managers who established the first English colony in America. In 1787 Thomas Jefferson, who was as well informed in the premises as any man, knew of only five documents written during 1606–1616. In 1857 only twenty-seven of the contemporary papers had been printed in America; at the latter date the repositories of the Old World began to open their doors more freely, and since then the accumulation of evidence has been more rapid. Before the publication of Mr. Brown's volumes, seventy-one documents referring to this period had been published in the United States. To these Mr. Brown now adds about three hundred.

In presenting this mass of evidence, he has adopted the following classification: (1.) Manuscripts which have never before been printed; printed in full, regardless of their length. (2.) Printed papers which never have been reprinted either in England or in America. (3.) Manuscripts in foreign languages, of which translations into English have never before been printed. (4.) Manuscripts and printed papers which have appeared at a later date in print, but not in America. Classes 2, 3, and 4 are represented in full, except in some instances when the length renders this impracticable; in such cases extended extracts are given. (5.) Manuscripts and printed papers which have been printed in America. In this division, only the briefer papers are reproduced, but careful reference is made to the longer ones, and full account is given of the American reprint, including, in most instances, estimates of the probable market value of originals. (6.) Illustrated material of various descriptions, from the familiar scene of 'Westward Ho' to extracts from sermons, broadsides, and the variety-theatre doggerel of the day.

The feature of these volumes which will be of most constant assistance to critical students of the period is doubtless the collection of brief biographies, filling 250 pages. No casual reference to the titles in this collection can suggest more than the most superficial estimate of the amount of labor which the collation has cost. These biographical notices constitute a thesaurus richer than any previously available authority, and containing information in many cases entirely new, even to specialists. Altogether, it will be a more reliable guide to the biographical facts connected with the period than any single library in the United States.

The most obvious excellence of the work is the clearness of perspective gained by adopting London as the vanishing point. There is a unity and integrity of view which is, at once, natural in the combination and arrangement of details and ideal in exclusion of distractions. In these documents the enterprise is not only a vivid panorama; it is a drama, developing with the unity and precision of Elizabethan models. The determination of thought and adventure towards the New World appears in this delineation not as evidence of some single interest, nor as manifestation of some isolated principle, to which the historian is always tempted to reduce phenomena in his interpretations. The swinging of this new planet into the orbit of English life seems, on the contrary, to have caused perturbations in every part of the social system. Statesmanship, religion, commerce, patriotism, sentiment, are each thrown from their track and compelled into new courses. The English nation, as a whole, adjusting itself to relations which amount to a new social condition, is, accordingly, the picture which these volumes exhibit.

One scarcely begins to consider the material in this collection without becoming aware that Mr. Brown has contributed hardly less directly to the elucidation of diplomatic history than to the story of British expansion and American beginnings. For example, it has been the traditional belief that, from John Cabot to Sir Humphrey Gilbert, England claimed America north of Florida by virtue of the alleged Cabot discovery of 1497, in denial of the Spanish claim by right of Columbus's discovery in 1493 and the bull of Alexander VI. Mr. William Wirt Henry, in the 'Narrative and Critical History' (vol. iii., p. 106), seems to acquiesce in this view; and we notice that Mr. Hannis Taylor, in his recent volume, 'Origin of the English Constitution,' assumes the correctness of that supposition. Mr. Brown shows conclusively, however, that, except under Edward VI., the English Government did not fail to concede America, south of 44 degrees north, to Spain, and that the assertion of rights through the Cabots was at best a late idea, after Elizabeth had determined to make a right to America if she could not find one. Indeed, the very document in which, in 1580, the English Government declares its new doctrine with reference to America, virtually acknowledges that Spain's prescriptive right had not been questioned. The language is:

"That they could not acknowledge the Spanish right to all that country, either by donation from the Pope, or from their having touched here and there upon those coasts, built cottages and given names to a few places; that this, by the law of nations, could not hinder other princes from freely navigating those seas, and transporting colonies to those parts where the Spaniards do not inhabit; that *prescription without possession availed nothing.*"

In the clause which we have italicised we have a summary of the English case, so far as it professed to oppose to the Spanish claims a doctrine of international right; and this doctrine was not inherited from Henry VII., but was evolved at Elizabeth's council table.

Still further, the documents here collated exhibit the exploration and colonization of Virginia as a more important factor than has hitherto been realized in the game of war and diplomacy between Romanism and Protestantism. In this connection the eighty documents copied from the archives of Simancas have a manifold value. Dr. Curry, in securing the copies of the documents, and Prof. DeVere, in translating them from their archaic form, have enabled Mr. Brown to present a mass of evidence the importance of which he has certainly not overestimated. These papers make it possible to reconstruct the whole history of the period so far as it concerns the diplomatic value of American colonization. Mr. Brown furnishes in these documents abundant justification of the claim which he might have made, that we are, with their assistance, better informed about the relations of colonial enterprise to general European affairs than were the majority of the persons who were actively engaged in that undertaking.

The documents thus collected testify unexpectedly to the multitude of motives—scientific, economic, political, and religious—which combined to incite colonial enterprise. The economic character of the attempted plantation had apparently been understood before, but in the material now brought together there is a wider view than any which had previously been clearly perceived. The fact that the planting of colonies in America was looked upon by many religious people in the character of a religious crusade, is also familiar; but that these elements combined in exercising such an influence upon the imagination of all classes of English society as is evident from many of the documents thus presented, will astonish many to whom the movements of the period have long been subjects of study. For instance, the sermon of Symonds (p. 288) suggests a class of motives which have been frequently overlooked, and to which an inferior degree of importance has been attributed. We find in Symonds's discourse almost a paraphrase of the language which tradition has put in the mouth of Pope Urban at Clermont when he urged upon the poverty-stricken people the policy of forsaking overpopulated France for the land of Palestine, "which flowed with milk and honey." The same appeal, overpopulation in England and abundance in America, is combined with the motives of religion to make the reasons for participation in the Western enterprise irresistible.

Again, Mr. Brown has substituted for the Capt. John Smith superstition honor to a multitude of founders to whom honor is, doubtless, due. He even harries the memory of the dubitable hero with a savageness of irony quite exceptional and somewhat startling in a work of this class. No longer ago than 1884, Mr. Arber, in his preface to the works of Capt. John Smith, in the "English Scholars' Library," wrote:

"Some, of late, would have him to be the Baron Munchausen of his age; others, its swaggering and boasting *Pistol;* but this unmerited cloud of detraction and discredit with this volume passes away for ever. . . . One cannot read the following series without seeing that John Smith was something more than a brave and experienced soldier. Not only in his modesty and self-restraint, his moderation and magnanimity, his loyalty to the King, affection for the Church, and love for his country, did he represent the best type of the English gentleman of his day, but he was also a man of singular and varied ability. . . . Inasmuch, however, as the accuracy of some of Capt. Smith's statements has in this generation been called in ques-

tion, it was but our duty to subject every one of the nearly 40,000 lines of this book to the most searching criticism, scanning every assertion of fact most keenly, and making the text, by the insertion of the multitude of cross references, prove or disprove itself. The result is perfectly satisfactory. Allowing for a popular style of expression, the text is homogeneous; and the nine books comprising it, though written under very diverse circumstances, and at intervals over the period of twenty-two years (1608-1630), contain no material contradictions. Inasmuch, therefore, as wherever we can check Smith we find him both modest and accurate, we are led to think him so where no such check is possible."

Mr. Brown is, of course, perfectly familiar with Mr. Arber's work, and frequently refers to it, though not directly to the passages here quoted. Nevertheless, he calmly endorses the Munchausen and *Pistol* similes, and adds at least *Sir John Falstaff* and Alfred Jingle. In commenting upon Smith's 'Description of New England,' Mr. Brown remarks, for example:

"He tells the Adventurers for New England as to his being taken prisoner at sea in 1615, 'with foure men of warre provided as they were, they had been sufficient to have taken Sampson, Hercules, and Alexander the Great, no other way furnisht than I was'; but this peer of 'Sampson, Hercules, and Alexander the Great' overlooks the fact that his ship escaped, while he alone was taken. After this incident, he seems to have been dubbed '*Admiral*' by the North Virginia Company; but they trusted him with no more ships!"

Again, in commenting on Smith's letter to Queen Anne, and especially the account of the Pocahontas incident, Mr. Brown ventures the following:

"It was one of the afterthoughts of Smith's general history. Smith was a negative hero. He praises himself and abuses his peers, which heroes are not wont to do. He does not save women, as heroes usually do; but women save him, in every quarter of the globe, save Africa —Turk, Tartar, and Indian.

"Why did he slight the negro? He was as much a character of his time as Thomas Coryat and Artherus Severus Nonesuch O'Toole, and evidently afforded as much amusement to the poets and wits of the day."

In a later note, referring to the ostensible purpose of the letter to commend Pocahontas to the Queen's favorable notice, Mr. Brown adds:

"The success of the movement for establishing English colonies in America never depended on John Smith or Pocahontas, but it seems that the managers of the enterprise valued the services of Pocahontas much more highly than they did those of Smith, and Smith himself was probably fully aware of this fact. . . . She was brought over by, and was an object of great interest to, people of far greater influence than Smith. The letter was superfluous so far as the interests of Pocahontas were concerned, and the writer seems to be well aware of this fact, for although it is written ostensibly in her interest, it does not lose sight of the interest of Smith for a moment. Charles Dudley Warner well says, 'Fortunate is the hero who links his name romantically with that of a woman,' and this was Smith's forte; according to his account, 'he was rescued and protected and felt reliefe from that sex in his greatest dangers,' in nearly every quarter of the globe."

The evidence of Smith's incorrectness is not fully presented in these volumes, but they contain material sufficient to justify the above conclusion that, if such service were necessary, Mr. Brown has rescued the other founders from the ingratitude inevitable so long as Smith's monopoly of credit continued. We are inclined to the opinion that, in his excessive zeal for justice towards Smith's superiors and associates, Mr. Brown has needlessly discredited Smith. At all events, the edition of Smith's writings, cited above, together with the documents of Mr. Brown's collection, reduce the evidence to limits within which it at last seems practicable to reach a dispassionate and intelligent verdict.

Throughout his study of these volumes, the reviewer has encountered the rare difficulty of contending against constant temptation to abandon the judicial attitude for the rôle of the eulogist. Mr. Brown has not always confined himself to the presentation of evidence, and it would be easy to challenge some of his expressions of opinion; as, for example, the remark on the first page of the preface: "If the enterprise had then [1605-16] resulted in failure, the United States would not now be in existence." His conclusions often seem to us unauthorized by the data presented, and about many matters of fact these records obviously do not contain the last word. Mr. Brown's work, however, is of such inestimable importance, both as a contribution to knowledge and as a model of method, that it shames microscopic criticism as unsympathetic and trifling, and rather commands the most respectful recognition. Both the pious self-sacrifice of the author and the generous and patriotic coöperation of the publishers deserve unqualified praise. The result is veritable treasure trove for historical scholars, and will be easily conspicuous among our already respectable American *monumenta*.

MIDDLETON'S ENGRAVED GEMS.

The Engraved Gems of Classical Times, with a Catalogue of the Gems in the Fitzwilliam Museum. By J. Henry Middleton, Slade Professor of Fine Art, etc. Cambridge: University Press; New York: Macmillan. 1891.

THE subject of engraved gems and signets in general, whether engraved on the hard stones or the softer steatite or finer qualities of sandstones, or even on metal, is one of the most important and fascinating branches of the study of pure art, containing as it does the completest history of artistic development in its earliest epochs, and of classical design down to the Roman epoch, that can be given by any special form of art. The reasons for this are various: the primitive use of the form of the intaglio for giving authoritative sanction to documents; its use for purely decorative purposes as soon as wealth began to accumulate and run in the direction of the encouragement of art; the small size of the designs, which permitted the complete mastery of design earlier than in large works; and more than all, perhaps, the preservation of so many examples intact, from ages of which the important public works were destroyed. It is probable that we have engraved stones of from twenty-five to thirty centuries B. C.; and the Egyptian scarab, which is the earliest form of signet we know of, is found in clay or soft stone as early as the Fourth Dynasty, or about 3,700 years B. C. It is true that the scarab hardly comes within the category of art work, being simply impressed with the symbol appropriated by the owner of the signet and retaining this character as long as Egyptian civilization held out; it only became a work of art under influences alien to Egypt, and whose origin is a matter of dispute—possibly Phœnician, possibly Cretan or Greek—but in any case the use of the scarab was borrowed from the Nile. The reason for its adoption, given by Professor Middleton, is "on account of its [the beetle's] moulding large balls of clay, round like the world, in which it encloses its eggs." As a matter of fact, which it is curious that so close an observer as the Professor should have overlooked, the ball of the Scarabæus Pilularius is not of clay but of dung, on which the young feed when they are first hatched; and the ground of the reverence paid the insect by the Egyptians assumed by him is open to question, as we can by no means assert that the Egyptians knew that the world was round, or that this was even suspected at the date of the adoption of the scarab as a sacred symbol. More likely the adoption was due to the mysterious gifts of the creature; to its forming the sphere, the perfect figure, from which nothing can be taken and to which nothing can be added; to the very mystery involved in the insect's use or purpose in forming it—and when this purpose was discovered, the wonderful intelligence of the parent would increase the sacredness of its attributes; and it has occurred to the writer, seeing the insect in its hurried roaming over the smoothly beaten sands of the shores of the Mediterranean, that the long line of characters which it inscribes as it goes, resembling as it does a line of hieroglyphics, must have added something to the reverence paid it.

But in the adoption of the form as the vehicle of Greek design and the working out of an artistic intention, the insect changes its character and becomes another species: the Pilularius becomes the beautiful beetle with metallic blue wings which is the pest of the fig-trees in Greece and Italy, and the imitation of the specific character of it is as close as, and sometimes far more elaborate than, that of the Egyptian type. This is especially the case with the finest examples of the scarabs known as Etruscan, probably made in Etruria by engravers following Greek traditions. But even this is uncertain; and the most archaic type of the Italian scarab, sometimes carefully realistic in the form of the beetle, but with extremely primitive intaglio, has been pronounced by no less an authority than Prof. Roussopoulos of Athens to be of the Pelasgic period, and produced in Italy before the Greek arts migrated there. An interesting general observation has been made on the excavations at Falerii, where the Greek influence was strongest and lasted longest unmodified in central Italy, viz: that the scarab of any form was of extreme rarity, while at Chiusi and the cities in which the Etruscan element was absolute and the art least resembles the Greek, the scarab is common. In all the tombs opened at Falerii, not more than half-a-dozen scarabs were found, and these were all of a late period and Etruscan in the character of design.

The section of Middleton's book devoted to the scarab is not full enough to treat that form of engraved stone exhaustively, and it is that which, of all the forms of gems we have, is the most complex and puzzling, and in many cases the most fascinating in its art. Most puzzling, too, though far from the most fascinating of all, are the scarabs in which the archaic method of producing the intaglio obtains, *i. e.*, by a continuous line of drill-holes, which Roussopoulos considers of higher antiquity than Greek art in Italy. Prof. Middleton does not agree with Köhler in his assignment of this class of stones to the period of decadence, "from 280 B. C. to the time of Julius Cæsar," a conclusion which is, to any one who has studied the stones where they are found, simply absurd. The Professor would probably not agree with Roussopoulos either, but one curious fact is, that this class of incised stone is far more commonly found in certain parts of Italy and in Crete than in any other field. The writer once bought from a woman in the mountains of Crete a perforated trilateral prism of steatite with designs, on each face, of domestic animals in the archaic manner, and, learning that they were commonly worn by the women of the district, he inquired the use of them, and was informed that they pre-

served the milk of nursing mothers. He found also modern imitations of the talisman, but they were not esteemed as of equal virtue with the ancient, which the owners parted with reluctantly.

The ground covered by Prof. Middleton's manual is so broad that it was not possible to treat any branch of the subject in full detail. It is a compendium of the information to be derived from the classical authorities on all matters relating to gem-engraving, and makes a handbook indispensable to amateurs and collectors who have not the Professor's familiarity with the originals. The nature of the materials; the nomenclature of the ancients; the history of the noted gems which serve as standards of comparison, both of the genuine and the counterfeit; the technical methods; and, what will be of especial use to the intending collector and student, the indications which he must look for to guide him in the acquisition of engraved stones, are very full and precise; and useful excursions are made into the regions of coinage and forms of statuary allied to gem-engraving by the character of their design. There is, in fact, no such encyclopædic work on the subject, and every chapter might be enlarged into a monograph on its branch. The amateur who does not yet know the ground will be dismayed by the statements of the precautions taken by the forgers of antique gems, and the pessimistic opinion of the Professor as to his chance of getting an antique of the dealers. And truly there is nothing in the range of archæological material in which such, and so many, frauds have been, and are to-day, perpetrated. The most experienced collector is sometimes met by forgeries so well executed that he requires a long study to decide his doubts, and the time is not always given. There are certain stones as to which he can decide at once that they are antique; and there are certain that the first glance determines to be forgeries; but there are others, and these especially of the Italian Renaissance, which are extremely puzzling, and as to which the judges will perhaps always differ. The 'Engraved Gems' indicates all the artifices of the forger and the best indices of the genuineness of a gem, but after all it is only long experience and frequent blunders that educate the eye, and this education lies mainly in the perception of the character of design, for it is rather in this than in the technique that the best modern and fifteenth-century engraving differs from the antique. Counterfeit antiques are sent from Italy up the Nile to meet the tourists on unexpected ground, as coins are struck in Catania to be sold in Naples and Athens; they are put into the hands of peasants who assure you, in the name of the saints, that they dug them up in their own fields. To the inexperienced buyer the caution of Prof. Middleton will therefore be none too stringent.

The chapters treating of the technique may be considered exhaustive in effect, but on one point we are disposed to take issue with the author. In treating of the tubular drill he discerns its use in gems of the class of the "island stones" (lenticular gems), so called because they are found in the Greek islands—Crete, the islands which lie between that and the Peloponnesus, and the Peloponnesus itself. It does not seem to us by any means assured that the tubular drill was used in the cases in illustration. As these stones must be dated back as far as fourteen or fifteen centuries B. C., the perfection of metal-working implied in the hypothesis that these minute rings, marking the eyes, etc., of animals, are made by tubular drills, seems to us unlikely, the more that they are not necessary, a single graving point of the corundum set on the tool so as to describe a circle of the desired diameter, meeting all the requirements of the case. The Professor considers the fact that the tubular drill was used in Egypt as early as 4000 B. C. conclusive as to its use in Greece, but we know that various arts were practised in Egypt many centuries before they reached Greece, or even Crete, which was civilized before Greece. Pausanias, stating that Callimachus of Corinth was the first to bore stone (λίθους πρῶτος ἐτρύπησε) probably simply recorded the tradition preserved in Athens of the date of its importation from the East; and the fact of its having been known in Egypt centuries before in no way impeaches his statement.

In the Museum of Palermo there is a curious indication of the use of the seal intaglio, in a collection of clay impressions of various seals, found in front of the door of one of the temples of Selinos, in a heap and imperfectly burnt, as if they had been exposed in a conflagration. The lumps of clay bear sometimes a single seal, sometimes two, or even three; but as the temples were not burned, it is supposed that these seals were attached to documents which, having been kept in the treasury, were piled in front of the Temple and burned in a mass, baking the clay incidentally. Some were evidently on contracts, and some bore what seems to have been the seal of the Temple, and others that of the city, combined on the seal with the private signet of the party contracting.

As a manual of engraved gems and gem engraving, the book of Prof. Middleton takes its place with Head's 'Historia Numorum,' and the chief fault to be found with it by the student of archæology is its brevity. It is followed by a catalogue of the gems in the museum of which the author is director, and is sufficiently illustrated by cuts in the text and two plates of phototypes, the former being much superior in their illustrative value and excellent in their way, while the phototypes are below the average of published work of their kind. This is the only defect in the get-up of the book, which has, moreover, an excellent index.

Home Life on an Ostrich Farm. With ten illustrations. By Annie Martin. London: G. Philip & Son. 1890. 8vo, pp. 288.

THIS is a perfect book of its kind. It aims to give no more than a simple description of a South African home, its manner of life and surroundings. Mrs. Martin joins keen observing powers to a great love of nature, both animate and inanimate, and a rare descriptive faculty; and her pictures of the farm life, but, above all, of her dumb companions, are admirable. She is so entirely in sympathy with all about her, in fact, and treats even her hardships and discomforts in such a sunny temper, that the reader receives a more favorable impression of her home than the reality would probably warrant. For, all things considered, the Karroo, as the plateau on which the farm was situated is called, can hardly be regarded as an attractive place. It is a treeless, cactus-covered wilderness, with barren mountains hemming in a plain parched to a dull brown under a "hard gray metallic sky," except for a few days after the infrequent rains, when the veldt is bright with flowers and short-lived herbage. A redeeming feature, however, is the climate, and if to be well is the *summum bonum* of life, evidently the Karroo is the most favored spot on the globe. "No one is ever ill here," is a boast which has some truth in it; moreover, "No one need die of consumption, however advanced a stage his disease may have attained, if he can but reach the Cape Colony and *proceed at once inland*."

The most important, if not the most interesting, chapters in Mrs. Martin's book, which is not a continuous narrative but a series of detached sketches, are naturally those upon the ostrich, a stupid bird which assumes a real individuality, however, under her skilful handling. She gives its biography in detail from the time it emerges from the shell, with its "sweet, innocent baby-face," large eyes, plump, round little body, "not unlike a hedgehog on two legs with a long neck," till its death. Some of her statements are very curious, and show, in one point at least, a remarkable intelligence or developed instinct in the bird. So far from deserting her nest and leaving her eggs to hatch in the sun, as was at one time the common belief, the hen is quite aware of the fact that the sun's untempered heat would be injurious to them. On a hot morning, therefore, when she leaves her eggs as usual for a quarter of an hour, she first places "on the top of each a good pinch of sand. This she does in order that the germ—which, whatever side of the egg is uppermost, always rises to the highest point—may be shaded and protected." It is at this time that the white-necked crow finds his chance for a meal. Unable to break the hard shell of an ostrich egg with his bill, "he carefully watches till the parent's back is turned and she is a good distance from the nest; then, flying up into the air, he drops a stone from a great height with a most accurate aim, and breaks an egg." In the same manner, it may be added, the crow kills for food the tortoise, numbers of broken shells, some of immense size, being found about the veldt.

During incubation the male is very savage, and it is impossible to walk about the camps without a "tackey," a long and stout branch of mimosa with the thorns left on at the end. This is thrust into his face as he is about to charge, so bewildering him that to escape is easy. "Fortunately, you are never assailed by more than one ostrich at a time; for in the large camps of some two thousand acres each—in which the birds are not fenced off in pairs, but live almost in the freedom of wild creatures—each one has his own domain, separated from those of others by some imaginary boundary line of his own, visible only to himself, but as clearly marked out as the beat of a London policeman." The young birds are plucked for the first time when nine months old, but the feathers do not attain their full width and softness till the third year. On the large farms—this one consisted of twelve thousand acres—the birds are "rounded" up for plucking much as cattle on a ranch, the feathers being cut two or three months before they are ripe, to prevent the tips from being spoiled. The age which the ostrich attains is uncertain, "for, however old they become, they never show any signs of decrepitude, nor do their feathers deteriorate." Death is almost always the result of an accident, most frequently from a broken leg. "The bone seems almost as brittle as porcelain; and a comparatively slight blow is enough to splinter it into just such jagged and pointed fragments as result from breaking the spout of a china tea-pot."

It would be hard to find a more amusing set of companions than the dumb inmates of Swaylands. The meerkats, or pencilled ichneumons, the crow, the secretary bird, Jacob—above all, the faithful collie, Toto—are described with infinite sympathy and humor, and are made to seem almost human in their intelligence,

Some of them were evidently as fond of a joke as their mistress. When she went about the place, she was generally followed by a small train of animal friends. Among these was Bobby, the crow, who "would come up noiselessly behind and, catching the tip of the meerkat's tail in his bill, would lift the little fellow off his legs, take him up a few feet into the air, and drop him suddenly. Then, after waiting a few moments till his victim had recovered his composure and was off his guard, he would repeat the performance." Another of the Karroo birds is the kapok, which builds a curious snake-proof nest out of wild cotton.

"The nest, which is very compact and looks as if it were made of soft, white felt, is of much the same shape as the oriole's brown flask; but near the outlet it is dented in, forming a kind of second or exterior nest, in which the little paterfamilias mounts guard over his household gods, effectually closing the aperture by the pressure of his back against the curving end of the tube above him. The white felt is very thick and firm throughout the globular part of the flask, but gradually diminishes in density along the neck, till at the orifice it is so thin and loosely woven that the soft edges, pressed together by the bird, remain interlaced even after he has flown from his sentry-box. No apparent aperture is left; and the little stronghold is quite impregnable, and ready to baffle the wiliest of ophidian marauders, until Mrs. Kapok, by flying out, reopens the tunnel."

Mrs. Martin does not give a very favorable impression of her English-speaking Africander neighbors. "They are a fine, sturdy, self-reliant race, splendidly fitted in every way for their extremely rough-and-ready surroundings," unsurpassed in their kindness and hospitality, but ill-educated, unprogressive, and with a wofully low standard of business morality. Incidentally she states, without reservation, that "the Cape Colony is the worst-governed country in the world, with the exception, perhaps, of Turkey and Morocco." One of the most entertaining chapters is on "Our Servants," which ought to be read by all who are inclined to despair over the imperfections of their "help." The illustrations, mostly from photographs, are excellent: one of them, representing the best kinds of ostrich-bush, by Mrs. Martin herself, shows that she is as skilful with her pencil as she is with her pen.

Essays in Little. By Andrew Lang. With portrait. Charles Scribner's Sons.

THIS is another of Mr. Lang's journalistic volumes, for though what is not fresh in the book is partly reprinted from magazines, the style of the brief essays is that belonging to the newspaper: they are fragmentary, conversational, rambling, personal, and delightfully clever at their best. The brightest of all, the most admirable in lightness of touch and amiable sufferance of fashions old and new, is the tribute to the once popular but now forgotten song-writer, Thomas Haynes Bayly, author of "Oh no, we never mention her," "I'll hang my harp on a willow tree," "Gaily the troubadour," and countless other smooth-flowing verses which somehow caught the fancy of the piano-playing and song-trolling folk. What was the secret of his success, or how the real thing differs from the facile parody of Mr. Lang into which he constantly falls, may be sought for by the curious; but whether they find it or not, we promise them an entertaining quarter-hour with the "hypnotized" critic.

There are fifteen other papers besides this, and they are mostly upon the author's favorites, such as Dumas, Thackeray, Dickens, Homer, Lever, Kingsley, Scott, etc. They are very informally written, and generally express only the critic's delight in adventurous or boisterous life depicted in literature, in story-telling for its own sake, and in the human interest of great works deficient on the artistic side. If we say that Mr. Lang likes "healthy" books as that word is loosely used, that is the whole story of his criticism; for what appears in his pages is not thought, but his keen personal enjoyment of his author. In the article in behalf of Scott's poetry, for instance, he stops to tell us that he went boating on St. Mary's Lake and took the book along, and then he cites his favorite passages with praise, and thinks Scott was a poet; but there is infinitely more to be said on Sir Walter's side, and to be said not apologetically at all, but with assurance, so that a lover of literature is much dissatisfied to find so inadequate a paper. Mr. Stevenson and Mr. Kipling are the only contemporaries who come in for commendation, and it is a pleasure to notice that, though extravagant at points, it is not undiluted panegyric, such as has latterly brought a part of English current criticism into some discredit.

As a whole, the volume is too incomplete in its method of treatment to take rank above the ephemeral class, but it is both instructive and entertaining within its limits.

BOOKS OF THE WEEK.

Arnold, Sir E. After Death in Arabia. W. S. Gottsberger & Co.
Austin, A. Prince Lucifer. 3d ed. Macmillan & Co. $1.75.

JERRY.

The anonymous novel which appeared in *Scribner's Magazine.* 1¾mo, $1.25.

Detroit Free Press: "The author is one who seems to have the happy gift of endowing imaginary characters with the reserve force that is so rare in real life."
Cincinnati Christian Leader: "The work of a genius, a wonderful story."
Boston Beacon: "To be classed with the most remarkable fictions of recent years. . . . Convinces one of the advent of a new force in American literature."
Boston Budget: "Remarkable. . . . The writer exhibits virile characteristics."
New Orleans Times-Democrat: "Literature is the richer for the advent of this new writer."
Independent: "They have unearthed a prize in the author of 'Jerry.' . . . There is nothing immature in the writer's style, and if he is a young man we hope he will preserve his anonymity for many years to come, and not allow himself to be ruined by easy fame."

Dyspepsia

HORSFORD'S
ACID PHOSPHATE.

In dyspepsia the stomach fails to assimilate the food. The Acid Phosphate assists the weakened stomach, making the process of digestion natural and easy.

Dr. R. S. McCOMB, Philadelphia, says: "Used it in nervous dyspepsia, with success."

Dr. W. S. LEONARD, Hinsdale, N. H., says: "The best remedy for dyspepsia that has ever come under my notice."

Dr. T. H. ANDREWS, Jefferson Medical College, Philadelphia, says: "A wonderful remedy, which gave me most gratifying results in the worst forms of dyspepsia."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION: Be sure the word "Horsford's" is printed on the label. All others are spurious. Never sold in bulk.

Charles Scribner's Sons'

NEW BOOKS.

A PUBLISHER AND HIS FRIENDS.

Memoir Of John Murray.

With his Correspondence and an Account of the Origin and Progress of the House, 1768–1843.

By Samuel Smiles.

Two vols., 8vo, with Portraits..... $9 00

G. W. Smalley's Despatch to N. Y. Tribune:

"It is the second John Murray, Byron's Murray, who is nominally, and to some extent actually, the hero of these two volumes. The whole story of his relations with Byron, with Scott, with Moore, with Disraeli, with Hallam, with Lockhart, with Gifford, and with many much less distinguished but still interesting men of letters, is here told with fulness and discretion, based on authentic documents. It is in fact these documents, mostly original and heretofore unpublished letters, which give these volumes their highest value. They are a contribution to the literary history of the century. They abound in reminiscences, and in side-lights thrown sharply on men and things having to do with literature."

Harold Frederic's Despatch to N. Y. Times:

"One of the most valuable and entertaining contributions to English literary history in many years. No other posthumous work of our time, rich as it is in noteworthy examples of the kind, affords such keenly drawn and intelligent pictures of the galaxy of great writers and striking personalities—Scott, Byron, Campbell, Southey, De Staël, Canning, Crabbe, the two Disraelis, and a host of others—who are linked to the fortunes of the house of Murray."

JUST ISSUED:

Zadoc Pyne,

And Other Stories. By H. C. Bunner. 12mo, cloth, $1.00; paper, 50 cents.

"Mr. Bunner's most eminent characteristic is an exquisite taste, a faultless literary breeding, and an unerring instinct of literary refinement, which yet does not lack in strength, and is fully masculine."—*N. Y. World.*

How the Other Half Lives.

Studies Among the Tenements of New York. By Jacob A. Riis. Illustrated from Photographs by the author. 12mo, $1.25, *net*.

"Worthy to be a companion to 'In Darkest England,' to which, indeed, as a picture of existing conditions, it is superior. It presents by pictures for the eye, and pen and ink pictures quite as graphic, those phases of modern paganism which exist in our great cities."—*Dr. Lyman Abbott.*

Essays in Little.

By Andrew Lang. With Portrait. 12mo, $1.00.

"One of the most entertaining and bracing of books. Full of bright and engaging discourse on man, woman, and letters, these charming and recreative essays are the best of good reading. They ought to please every class of reader."—*The Saturday Review.*

Macmillan & Co.'s

NEW BOOKS.

A New Book by Professor Goldwin Smith.

CANADA AND THE CANADIAN QUESTION.

By Goldwin Smith,

Author of 'Three English Statesmen.' With Map. 8vo, $2.00.

"For the special purpose of this work it seemed best first briefly to delineate the provinces, which are the factors of the case, then to sketch their political history leading up to confederation, then to give an account of the Confederation itself, with its political sequel, up to the present time, and finally to propound the problem."—*From the Preface.*

A New Book by the Very Rev. R. W. Church.

THE OXFORD MOVEMENT.

Twelve years, 1833–1845. By R. W. Church, M.A., D.C.L., Sometime Dean of St. Paul's, and Fellow of Oriel College, Oxford. 8vo, $3.50.

New Book by the Bishop of Durham.

ESSAYS IN THE HISTORY OF RELIGIOUS THOUGHT IN THE WEST.

By Brooke Foss Westcott, D.D., D.C.L., Lord Bishop of Durham, Honorary Fellow of Trinity and King's Colleges, Cambridge, author of 'The Gospel of the Resurrection,' etc., etc. Globe 8vo, $1.75.

An Introduction to the Study of PETROLOGY.

By Frederick H. Hatch. With forty-three Illustrations. Second Edition. 16mo, 90 cents.

Just Published. 12mo, cloth, $1.50.

OUTLINES OF PSYCHOLOGY.

By Harald Höffding, Professor at the University of Copenhagen. Translated by Mary E. Lowndes. 12mo, cloth, $1.50.

Contents: Subject and Method of Psychology—Mind and Body—the Conscious and the Unconscious—Classification of the Psychological Elements—The Psychology of Cognition—The Psychology of Feeling—The Psychology of the Will.

New and Cheaper Edition. 12mo, $2.25.

MARIUS THE EPICUREAN.

HIS SENSATIONS AND IDEAS. By Walter H. Pater, M.A., author of 'Appreciations,' etc., Fellow of Brasenose College, Oxford. 12mo, $2.25.

"The fact is that 'Marius, the Epicurean' is a book to read and reread. . . . Enough has been said to show those who are likely to appreciate the book what unusual matter for appreciation they have within reach."—*Pall Mall Gazette.*

New Book by the author of 'A Weaker Vessel.'

HE FELL AMONG THIEVES.

By D. Christie Murray and Henry Herman. 12mo, $1.25.

THE ADVENTURE SERIES. New Volume.

THE LOG OF A JACK TAR:

OR, THE LIFE OF JAMES CHOYCE, MASTER MARINER. Now first published, with O'Brien's Captivity in France. Edited by Commander V. Lovett Cameron, R.N. With Introduction and Notes. Illustrated. 12mo, $1.50.

MACMILLAN & CO.,

112 Fourth Avenue, New York.

D. Appleton & Co.'s

NEW BOOKS.

The Nation.

NEW YORK, THURSDAY, APRIL 9, 1891.

The Week.

It appears now to be ascertained that only two of the eleven Italians killed in New Orleans were Italian subjects. As Mr. Blaine has admitted "the principle of indemnity"—that is, the right of the relatives of such Italian subjects as may have been wronged by a violation of the rights secured to them by the treaty, if any there be, to pecuniary compensation—whenever the discussion of this compensation begins, the value in money of the lives lost will of course come up at once. Mr. Blaine's first question will be, What kind of men were they whose fate we are all deploring? To what extent were they useful to their families and to the society in which they lived? What was the nature of their moral, apart from their legal, claims on the protection of the United States Government? To this the Marquis di Rudini will, it appears, have to answer that one of them, Vincenzo Traina, was a professional robber and cut-throat in Sicily, his native place, and a fugitive from Italian justice. The other, Antonio Catuna, was also a murderer and a fugitive from Italian justice. The compensation due to the relatives of a slain honest Italian laborer, lawyer, merchant, or doctor would be ascertained, in terms of money, partly by considering the amount of his lawful annual earnings, and partly by considering the estimation in which he was held in the community in which he lived, and the credit which his life and career reflected on his family and in his native country. But how would the lives of two fugitive cut-throats be appraised? What jurist, moralist, or auctioneer should be called in as an expert by the arbitrators sitting on this question? Would there not be some danger that, after hearing the evidence, Mr. Blaine might set up a counter-claim against Italy for the damage done by the presence of two such Italians in an American city during a certain period of time, including the expense of watching, catching, and trying them? If this be considered a fantastic view, can the question of pecuniary indemnity be discussed at all without the submission of a counter-claim against Italy on behalf of the family of the murdered Hennessy, the Chief of Police? Hennessy really lost his life because he was trying to break up, among a portion of the Italian colony in New Orleans, the practice of murdering each other. The number they had murdered when he intervened is estimated at thirty. As soon as he intervened they murdered him, so that it may be fairly said that he died in the service of the Italian kingdom. We do not say this claim on the Italian Government is a legal claim, but the claims submitted under the "principle of indemnity" will not be legal claims, but moral ones, and as a moral claim that of Hennessy's heirs will, in our opinion, be the best of the lot.

The Rio *News* of February 17 finds public sentiment in Brazil so overwhelmingly opposed to the so-called reciprocity treaty with the United States that, although itself favoring the treaty, it thinks it might better be rejected, since "a treaty of reciprocity loses much of its value if the parties to it are not heartily in accord, and if the treaty is not the frank expression of their mutual wishes." The *News* expects that when the treaty is rejected, the President of the United States Government will put a duty of three cents per pound on Brazilian coffee at once. Apparently the Brazilians are not alarmed by the prospect of our taxing ourselves ten million dollars per year for one of the necessaries of life, and making a present at the same time of some six millions to other coffee-growing countries. Our importations of coffee from Brazil are a good deal more than one-half of our total importations. In the year 1889 we received from Brazil 374 million pounds, and from all other countries 204 million pounds. If a duty were put on Brazilian coffee only, the price of all coffee would rise in our market by the amount of the duty, or very nearly that. But our Treasury would get the three cents per pound only on the Brazilian article. The advance in price on other coffees would go to the producers in Venezuela, Java, Hayti, etc., for which, no doubt, they would be duly thankful.

The Boston *Advertiser* learns from an official source in which it reposes confidence that the President will *not* put a duty of 1½ cents per pound on hides from the Argentine Republic in case the latter refuses to lower her tariff on our products. The reason why he will not do so is that he recognizes the present financial difficulties of the Argentine Government. The Argentines are under the necessity of raising a large revenue from customs duties, and President Harrison would not put a stone in their way. The *Advertiser* coincides with this humane view. "We ought not to take advantage of the distresses of our neighbors to vex them with tariffs in the hour of their need. The brotherhood of man forbids such a policy. Another fact not mentioned by the *Advertiser*, namely, that the putting of a duty on hides would smash what is left of the Republican party in Massachusetts, may have helped President Harrison to make up his mind. In fact, we think that if the Argentine finances were in the most flourishing condition imaginable, the President's decision not to put a duty on hides would be about as firm as it is now. If the Argentines had a Treasury surplus instead of a deficit, our compassionate and brotherly feelings would remain at about the same tender pitch as at present.

The sudden departure from Washington of the Canadian Commissioners appointed to negotiate a treaty of reciprocity with Mr. Blaine has given rise to all sorts of conjectures, and everybody is wondering what the reciprocity movement was begun for if it was so soon done for. The explanation is offered on both sides that President Harrison desired to take a part in the negotiations personally, and that, having made arrangements for an extensive tour in the South and West, he found it necessary to postpone the negotiation until his return. As the use of the telegraph is not unknown in Washington, the further explanation is offered that a telegram was sent to Ottawa to notify the Canadians of this change of programme, but that they had already started on their mission. So it appears that while the telegraph is recognized as a convenient instrument to prevent unnecessary journeys, it is not known how to use it to shorten them. Probably Mr. Foster, the Dominion Minister of Finance, will severely reprimand his subordinates when he returns home for not repeating the telegram to him on the train by which he was proceeding to Washington. The *faux pas* would have a rational explanation if we were to imagine that President Harrison had changed his mind at the last moment, and determined not to have any reciprocity treaty with Canada at all. Indeed, it is hard to see where reciprocity could begin without tearing the McKinley Act in tatters. After having taken such pains to "protect" hay, straw, potatoes, barley, eggs, fresh milk, oatmeal, wood pulp, lime, building stone, vegetables, bouquets, plants, fresh fish, etc., it would have been a terrible discomfiture for McKinley to have a negotiation going on whose very first move would have been to put all these things on the free list. The very presence of the Canadian Commissioners at Washington would have endangered his chances of becoming Governor of Ohio. If this is the true explanation of the sudden stoppage of the negotiation, Mr. Blaine owes Mr. McKinley "one," and will no doubt pay it to him in good time.

The Farmers' Alliance secured control of both branches of the Nebraska Legislature last November, and their constituents expected to see the promised era of "reform" in the Capitol. The session closed on Saturday, and a despatch from Lincoln says: "The closing scenes of the Legislature were disgraceful beyond description. The session wound up in a drunken orgy, lasting until daylight. Case after case of wine was taken into the House, and large quantities of whiskey and other liquors were consumed. The last official act of the Legislature was to pass a resolution declaring that Nebraska is eager to go to war with Italy, and that the United States ought to prevent Italian immigration." This is worse than has been recorded of any Legislature controlled by either of the old parties, and is calculated to suggest doubts to the minds of

even the farmers as to whether the Alliance is really going to "reform things."

The Alliance members of the Minnesota Legislature have become so sensitive under newspaper criticism as almost to have succeeded in passing through the Senate a bill which provides that all articles, editorial items, and written accounts printed or published in any pamphlet, periodical, magazine, newspaper, sheet, circular, or handbill which shall therein purport to relate, state, describe, or give an account of or give intelligence of any political, official, personal, or social act, writing, or speech of any human being, living or dead, reflecting in any way upon such person's character, shall be subscribed by the full name of the person or persons who shall have written, composed, edited or prepared for such publication such article, editorial item, or written account. Penalty for failure to comply with the law is a fine of not more than $100 or less than $20, or imprisonment for not more than three months or less than thirty days. We are surprised that the publication of portraits or cuts of anybody, without signed authority, is not included in the list of offences, for surely here is a genuine grievance in all parts of the land, from which members of the Farmers' Alliance are not the only sufferers. There is such recklessness shown in the selection of these "cuts," in the "hurry of going to press," that nobody can feel any assurance that the one put forth fits the man to whom it is assigned. It is very seldom that cuts of the same man agree in any two newspapers; and if the majority of our rising statesmen really resemble any of the current newspaper portraits of them, it is in the interest of everybody concerned, if not in the interest of popular government itself, to have the publication of them in future surrounded with such difficulties as will prove practically prohibitive.

Senator Edmunds and Senator Plumb have allowed themselves to be interviewed in a careful way on the political situation, and both have taken occasion to point to the danger that the Farmers' Alliance threatens of throwing the next Presidential election into the House of Representatives, in which case the Democratic candidate would be elected. Such a result could follow only in case the Alliance should carry a certain number of States, leaving each of the other parties without an actual majority of the Electoral College. It is possible that the Alliance may carry Kansas, Nebraska, Minnesota, and one or both of the Dakotas. All of these have hitherto been Republican States, and if they should be taken out of that column, the column would crumble. But the prospects of the Alliance carrying those States will be sufficiently clear in the autumn of 1892 to exercise a potent influence on the vote of other doubtful States. If it should become pretty evident before the election that the Republicans were in real danger of losing so large a slice of their accustomed vote, the reflex action in the doubtful States, such as New York, Massachusetts, and Indiana, would be very nearly decisive against them, while the same feeling would make Illinois, Iowa, Wisconsin, and Michigan doubtful. Therefore we cannot consider the danger of the election being thrown into the House very serious.

The Democrats have once more carried the State of Rhode Island and at the same time lost control of its government. Their candidate for Governor had a plurality of over 1,200, but not a clear majority over all; and as a majority is necessary for an election, there is no choice by the people, and the contest goes into the Legislature for decision. As the Republicans have a majority in the Legislature, they will elect as Governor their own candidate whom the people have refused to elect. This is in accordance with the antiquated system which the Republican managers in the State keep in operation, as the same party's managers do in Connecticut and New Hampshire, years after it has been abolished nearly everywhere else, to meet precisely this emergency. Its only effect is to permit a party which is in a minority in the State to retain control of the State government through the working of the town system of representation in the Legislature. In spite of these unjust advantages for the Republicans, the Democrats could have won this year in the legislative districts as well as in the State at large if they had shown more wisdom and public spirit in their legislative policy. So far as national issues are concerned, the State is Democratic, for in Presidential elections a plurality elects, and Rhode Island now has an unquestioned Democratic plurality.

It is becoming plain that the exigencies of Republican politics in Philadelphia and other large cities of the State have made necessary the defeat of the pending ballot-reform bill in the Pennsylvania Legislature. The Philadelphia *Press*, which is, for some inscrutable reason, almost invariably in favor of that kind of political reform which its party refuses to adopt, says the "Steering Committee" of the party in the Legislature has given orders that the bill must be beaten, and it thus warns the Republicans: "Such a course would prove the gravest mistake, and the Republican members who follow out such a policy will do their party a great wrong. It will pay to be fair and frank in this matter. The defeat of the ballot-reform measure now before the House, and the adoption of a scheme for a Constitutional Convention to be held at some distant time, means that the ballot-reform question is to be sidetracked by this Legislature. That is the plain sense of it, and the people will not be fooled with the idea that it means anything else." But the Republicans of the State are accustomed to the warnings of the *Press*, and are not likely to pay much heed to them. They remember that it threatened to "stand dumb" about Quay when the lid was taken off his State Treasury operations, and that it has been defending him with great volubility and shamelessness ever since the lid was removed, saying, in fact, that the removal was the devilish work of free-traders.

The enemies of ballot-reform legislation in this country have constantly taken pains to insist that this is "un-American." The Cincinnati *Commercial Gazette* has sneered at it as "kangaroo reform," and Boutelle has denounced it as "a penal-colony institution." It happens, however, that the secret ballot, which is the foundation of the reform, found a warm defender in the first session of the United States Senate as long ago as the year 1789. The matter came up in connection with the subject of confirming nominations. Vice-President Adams proposed that he should rise in the chair and ask each Senator how he would vote. Senator Ellsworth argued that voting by ballot suited bashful men best. Senator Maclay, the radical Democrat of the body, replied (we quote from his diary): "So far from balloting being productive of caballing, it was the very antidote against it; that men made bargains for certainties, but it was in vain to purchase or bargain for a vote by ballot which there was no certainty of the party ever obtaining, as he had no method of securing the performance of a promise or of knowing whether he was deceived or not." The resolution in favor of a ballot was carried, but, so far as nominations were concerned, the matter was afterwards reconsidered. This argument of this early Democratic Senator has been used time and again in the recent discussion of ballot reform in the United States. It goes to the root of the whole matter, furnishing the reason why a secret ballot at the polls is a check on bribery and intimidation. That the Australians saw the force of it, as applied to popular elections, before we did, is no reason why it no longer holds good.

One of the reasons why the prices of domestic wool have declined is that the woolgrowers, putting their dependence on the tariff to keep out foreign wool and ward off competition, have allowed their own product to deteriorate in quality. The sheep are now imperfectly fed and cared for, and much extraneous matter is allowed to mingle with the fleece. The result, is that a large amount of Australian wool has been imported to take the place of this deteriorated domestic product. For many years the imports of Australian wool amounted only to 25,000 or 30,000 bales per annum. Since the 6th of October last, when the McKinley tariff went into effect, the importations of this wool have reached 42,000 bales. That is, the arrivals for six months have been more than they ever were in any single year before, and the trade advices are that when the next London sales take place, 12,000 bales more will be taken for New York and Boston. Probably before the end of the year 65,000 bales of the current Australian clip will have reached this country. This spectacle has driven the tariff-mongering shepherds, who thought

that they had been very smart, and who certainly were very unscrupulous, in their manipulation of the McKinley Bill, nearly wild. The only industry open to their attack at present is that of carpet-making. The sorting clause and the change-of-samples clause offer them an opportunity of getting a new tax levied without any new act of Congress. Under the latter clause they may get East India, Bagdad, and Khorassan wools, which now pay about eight cents per pound duty, put into the first class and taxed twenty-two cents per pound if they have been washed on the sheep's back, or thirty-three cents if they have been washed in any other way. Generally they are washed after shearing and before packing for market, and consequently would be subjected to thirty-three cents duty. That is, they would be prohibited altogether, and carpets would be imported instead.

The *United States Tobacco Journal* is moved to some remarks on the "Drawback Humbug" after reading what President Harrison said on the subject in his recent *Tribune* interview. What the President said was that under the McKinley Act "the American manufacturer can get raw material, for the duty is not charged when such material is imported to be manufactured into articles for exportation, and so the American merchant will be able to sell at the same point of advantage as the English merchant, with the additional advantage of free entry into the ports where treaties are made." The *Tobacco Journal* imagines a cigar-manufacturer trying to export his products and to get a refund of duties for that portion of his raw material which has been imported. He imports wrapper, paying duty at $2.75 per pound if stemmed, or at $2 if not stemmed, and filler, paying 35 cents per pound. A certain proportion of home-grown tobacco is used also. Now, how is a cigar-manufacturer to obtain his drawback? The first thing to be done is to ascertain what part of the cigar is of foreign and what part is of domestic material, and next, what part of the foreign material has been taxed $2 or $2.75 and what part 35 cents per pound. It might be supposed that by taking the cigar to pieces these facts could be ascertained. The parts would no longer be a cigar, it is true, but at least we should know what the drawback would have been, should we not? On the contrary, nobody could tell what parts were foreign and what parts were domestic, except that the wrapper might possibly be identified. It would be necessary, however, to prove affirmatively that the wrapper was imported, and to show whether it was imported stemmed or not stemmed, and to show that the duties had been actually paid. If no American tobacco were used, it would still be necessary to identify the different kinds of tobacco used, since they have different rates of duty. In short, the drawback is utterly inapplicable to the cigar trade. It is, says the *Tobacco Journal*, "as monumental a humbug as Schedule F [the tobacco duty] is a monumental folly of the McKinley Tariff Act."

The white population of the sixteen Southern States and the District of Columbia has, during the last decade, increased 2,915,070, or at the rate of 23.18 per cent., as against a negro increase of 845,692, or at the rate of 13 87 per cent. In both of the States whose race population has been but recently announced, viz., Mississippi and South Carolina, the negro gain since 1880 has been absolutely greater than that of the whites, and in the former (but not in the latter) it has been relatively greater as well. Mississippi the negro increase during decade has exceeded that of the whites by 37,174, and in South Carolina by 20,822. Between the tenth and eleventh censuses the negro population of South Carolina multiplied at the rate of 14.59 per cent. and the white at the rate of 17.22 per cent. In Mississippi the percentages of decennial increase were: colored 14.98 per cent., white 12.58 per cent. In the latter State there are now 208,013 more negroes than whites, and in the former 234,049 more. Comparing the statistics of the census of 1860 with those of the census of 1890, it appears that in each of the two States named the negroes have, in the thirty years intervening, grown somewhat more rapidly than the whites, and that as a consequence the number of negroes in every 10,000 of population, which was, in 1860, 5,528 in Mississippi and 5,859 in South Carolina, had by 1890 increased to 5,798 in the former State and to 6,016 in the latter. Except in the States which lie south of the southern boundaries of North Carolina, Tennessee, and Arkansas, and east of the Sabine, there is no likelihood of the negro population ever outnumbering the whites, for, except the States of South Carolina, Georgia, Florida, Alabama, Mississippi, and Louisiana, there is no State in which the negroes constitute as much as two-fifths of the entire population. Moreover, in those of the more northern Southern States in which, as in Virginia and North Carolina, the negroes are proportionately most numerous, they are increasing very much more slowly than the whites. In the six far Southern States east of the Sabine, taken together, the negroes now constitute a majority of the entire population, but in the last decade they have increased very much less rapidly than the whites in Alabama, Florida, and Louisiana, appreciably less in South Carolina, have not quite held their own in Georgia, and only in Mississippi have they multiplied at a greater ratio. In these States the aggregate white population has increased 21.53 per cent. since 1880, while the colored, if the census is to be relied on, has increased but 16.45 per cent.

For twenty years the tide in the States in question was running the other way, and that to so great an extent that even now, after the white gains during the last decade, there are only 4,905 whites in every 10,000 of total population, as against 5,036 just before the outbreak of the war. As the rate of the natural increase of the negroes since 1880 for the country as a whole has been probably between 13 and 15 per cent., the six States named have not only retained their native negro inhabitants, but have absorbed negro immigrants from other States. The white gain is due to the fact that the white immigration, especially to Alabama and Florida, was still heavier. Comparing the actual percentage of increase during the decade in the negro population of such States as have thus far been announced, with the rate of natural increase of the negro population as determined by the census, it appears that the number of negro immigrants to the States of Alabama, Mississippi, and South Carolina is about as great as that of the negro emigrants from them; that the latter exceeds the former in the States of Delaware, Kentucky, Maryland, Missouri, North Carolina, Tennessee, and Virginia, while the reverse is the case in Arkansas, California, District of Columbia, Florida, Georgia, Kansas, Louisiana, Texas, and West Virginia. In other words, there is unquestionably a movement of negro population from the more northern Southern States to the States of the far South and Southwest, and probably also northward to the old free States.

On March 15 the project of a pension law was submitted to the Swiss people and rejected by a vote of 352,462 against 91,679. The law proposed to give to Federal functionaries and officials who, on account of age or other infirmity, had become incapable of discharging their duties, and who had been at least fifteen years in the service, a pension amounting to not less than 25 or more than 50 per cent. of their salary, and in no case to exceed 2,000 francs. In exceptional cases, after thirty years of faithful service, the law permitted a pension of 60 per cent. of the salary, but in no case could such pension exceed the sum of 2,500 francs. In Switzerland 6,829 officials, or 80 per cent. of the entire personnel of the Federal Administration, are connected with the Post-office. Of these 6,829 persons 2,262 receive a salary of only 1,000 francs, 2,237 receive from 1,000 to 1,500 francs, 1,107 from 1,500 to 2,000 francs, 405 from 2,000 to 2,500 francs, 292 from 2,500 to 3,000 francs, 301 from 3,000 to 3,500 francs, 168 from 3,500 to 4,000, and 57 receive 4,000 francs. The necessity of the pension law is therefore perfectly apparent, and it would at present require an annual expenditure of only about 130,000 francs. Not merely as a matter of simple justice to poorly paid subordinate officials, but also as a means of increasing the efficiency of the public service by enabling sickly and superannuated persons to retire without danger of starvation, some such legislation is imperatively demanded. Only the cities of Geneva and Bâle accepted the proposed law by a vote of nearly three to one; but the rural districts and the working classes of the other towns voted it down by a majority of 260,788. The result was due partly to ignorance, but still more to deep-seated jealousy and suspicion of whatever seems to savor of bureaucracy.

THE ITALIAN TROUBLE.

THE withdrawal of the Italian Minister from Washington as a mark of the dissatisfaction of his Government with the answer he has received to the remonstrances addressed to Mr. Blaine touching the New Orleans lynching affair is, of course, greatly to be regretted. But we think its diplomatic importance may be overestimated, even though nothing worse is likely to happen. There is really hardly any material in the case for diplomatic discussion. As regards those victims who were American citizens, the Italian Government has no charge of them whatever, any more than of any other American citizens. It cannot call the American Government, either State or Federal, to account for anything that has happened to them. They had repudiated their allegiance to the King of Italy in a way which the Italian Government recognizes as valid. As regards those who were still Italian subjects, the case is equally clear. They lived at New Orleans under the Treaty of Commerce and Navigation concluded in 1871 between Italy and the United States, through Mr. George P. Marsh, then our Minister. Article i. secures for Italian citizens sojourning in the United States "the same rights, privileges, favors, immunities, and exemptions for their commerce and navigation as the natives of the country wherein they reside." Art. ii. secures to them the same trading rights and privileges as the natives. Art. iii. is, however, the one which has a direct bearing on the New Orleans incident, and we copy the first clause of it in full. The second clause simply provides for the exemption of Italian residents here from compulsory service in the American army or navy, or in any judicial or municipal office :

> "The citizens of each of the high contracting parties shall receive in the States and Territories of the other the most constant protection and security for their persons and property, and shall enjoy *in this respect the same rights and privileges as are or shall be granted to the natives, on their submitting themselves to the conditions imposed on the natives.*"

Now, what would or could be done by the State and Federal Governments to punish such offences as the slaughter of the prisoners in the New Orleans jail, supposing the victims to have been natives? The State Government could have indictments presented to the Grand Jury by the District Attorney against such of the rioters as could be identified, for murder or manslaughter, and, if the Grand Jury found true bills, could have them prosecuted either to conviction or acquittal by a petty jury. Here its powers would be exhausted, and nothing could enlarge them except an amendment to the State Constitution. In addition to this, however, we presume the relatives of the slain could bring civil actions for damages against the county and also against individual rioters. We do not speak on this point with confidence because we have not the Louisiana law before us, but it is very certain that if the relatives can do this, they cannot do anything more than this. The county and the rioters may be liable to them in damages, and, if they are, the damages must be recovered in the courts by suits instituted and prosecuted by the relatives themselves. The State itself cannot be sued.

What can the United States do? Nothing more than the King of Italy himself. It cannot interfere forcibly in State affairs except on the demand of the Governor or Legislature. It has no jurisdiction of offences against person or property in the States. It could not assume it, except as the King of Italy might, by force of arms. Even if it had jurisdiction of such offences, it would have to punish them in precisely the same manner as the State—that is, it would have to have indictments found by the Grand Jury, and have the case tried before a petty jury, and, as all criminal offences triable in Federal Courts are, under the Constitution, triable only "by an impartial jury of the State and district wherein the crime shall have been committed," these Federal juries would be composed of exactly the same material as the State juries.

All these peculiarities of our jurisprudence are things of which the Italian Government was aware when it made the treaty of 1871, and of which every foreigner who comes here for business or pleasure is bound to take note at his peril. Every traveller or sojourner must be assumed to have considered, before entering a foreign country, the various risks, whether political, physical, or legal, to which he would be exposed during his stay, whether through defects of the laws or the absence of law. But no civilized government ever acknowledges that the protection it supplies for the persons and property of its own citizens is not good enough for strangers.

Secretary Blaine's answer to Baron Fava is very neat and complete, and puts the whole case in a nutshell. It makes the position of the Italian Government difficult to comprehend. The Italy of to-day is very far away in matters of government from the old Italy of 1840, when any Italian Government could seize any man it pleased, and either expel him from the country, or clap him in prison for an indefinite period without trial. Italians understand and are practising with great success a government of law and liberty. An Italian cannot, under his own Constitution, be punished for anything without a trial by legal tribunals. We are surprised, therefore, to find the Marquis di Rudini maintaining "Italy's right to demand and obtain punishment of the New Orleans murderers" of the President. The President has, as we have just shown, no more power to punish murderers than the Marquis himself. Demands of this sort are, in fact, not now addressed to any but semi-barbarous Governments like Turkey, Morocco, Russia, and China, where the Executive can at any moment give a man a dozen, or send him to the mines for life by "administrative order." What constitutional governments are asked to do in case of injury to foreigners is to put the law in motion for the punishment of the offenders—not to guarantee a verdict of guilty. Considering, too, what foreigners have suffered, ever since the present kingdom of Italy was established, from Italian brigands, both in Sicily and on the mainland, through the inefficiency of the police and the courts and the demoralization of the population, it seems as if a less peremptory tone in demanding justice in this case would have been more becoming. The Marquis di Rudini could hardly have been sterner if he had been asking for justice against the murderers of two respectable Italian merchants or tourists, instead of two escaped cut-throats, whose landing in this country at all might fairly be considered an offence against its peace and dignity.

At the same time it will not do to ignore or deny the fact that the inability of the Federal Government to set on foot, in its own courts, prosecutions for injuries to foreigners, is a serious defect in the law. It ought to be able to order the indictment of the New Orleans rioters before its own Grand Jury, through its own District Attorney, try them before its own courts, and carry out the sentence through its own marshal. The Supreme Court has intimated that legislation for this purpose would be constitutional, and it ought to be one of the first pieces of work of the next Congress. We do not know what Mr. Blaine means when he says that "the United States has distinctly recognized the principle of indemnity to those Italian subjects who may have been wronged by a violation of the rights secured by the treaty with the United States of February 26, 1871." There was no such recognition in the case of the attack on Spaniards in New Orleans in 1850, or of the attack on the Chinese at Rock Springs in 1885. In the latter case an indemnity was voted, but it was expressly stated at the time that it was a matter of grace, not of right. In other words, any acknowledgment of "the principle" has been expressly guarded against by Mr. Webster and by Mr. Evarts and Mr. Bayard. But Congress will doubtless be willing to follow the Chinese precedent in this case and vote the money. We must add that Mr. Blaine, in his letter to Gov. Nicholls of March 15, immediately after the massacre, rather delivered himself, dialectically speaking, into the hands of the enemy, by asking the Governor to "coöperate with the President in maintaining the obligations of the United States towards Italian subjects" who might be exposed to further violence in New Orleans. There is not much difficulty in construing this into an acknowledgment that the President is, conjointly with the Governor, responsible for the peace of that city.

BRAZILIAN VIEWS OF THE TREATY.

WHILE the reciprocity arrangement with Brazil was being received in this country with comparative indifference, in Brazil it was exciting an agitation that has at times been violent. Feeling against President, or Dictator, Fonseca ran high, both on account of the nature of the treaty itself and the way in which it was negotiated. It was concluded as an arbitrary act of the "Provisional Government," with no

reference whatever to the Congress, just on the eve of the adoption of a Constitution which specifically requires all treaties to be submitted to the approval of the representatives of the people. The matter was brought up in the Constituent Congress on February 11, when two motions were made by prominent delegates calling for the suspension of the treaty until it could be acted upon by the Congress to be hereafter elected. These motions went over without action, as did another approving the treaty. But the general conviction appears to have been expressed by the *Jornal do Commercio*—a paper that approves the treaty, or at least wishes it given a fair trial—when it said, "The treaty should never have been negotiated in such a secret fashion, without consulting the views of the States or our commercial and industrial interests." Indeed, Fonseca's action in the premises, and his general disregard of the Congress, developed the unexpected and powerful opposition to his election to the Presidency, and the large minority vote for Prudente de Moraes shows how strong is the hostility to the policy of the Government. In fact, even since Fonseca's election this hostility has not subsided, and a meeting was held on March 13, attended by a large number of Senators, and Deputies, and journalists, at which it was resolved to publish a solemn protest against the proceedings of the Government—particularly against the treaty with the United States.

Turning to less official expressions of opinion, we find the manufacturing and commercial interests of the republic almost unanimous in opposition to the treaty. Protest after protest has been drawn up by industrial and commercial associations in different parts of the country, expressing alarm at the impending ruin of nascent or even established manufactures. The flouring-mills will have to close, their owners say. Sugar-refining will come to an end, say the men interested in that business. So, too, many branches of agriculture and fishery are in dread of the deadly competition of the United States. The organs of foreign capital in Brazil are, of course, dead against the treaty. The French merchants particularly are aroused, and it is announced that the French Minister for Foreign Affairs has already telegraphed a demand that the same concessions be made to French imports as to American. This was done at the urging of the French Chamber of Commerce for the Export Trade. On the other hand, the producers of sugar, coffee, hides, and rubber are well pleased. The *Diario de Pernambuco*, speaking for the sugar-growers of its State, says that "the patriotic Government of Brazil deserves the thanks of the country."

That the Government itself is disturbed at the general outcry, is clear from the labored defence of the treaty made in the *Diario Official*—a defence, it is safe to say, which will not be reproduced by our Department of State. This official organ of the Brazilian Government expresses its surprise that such a hubbub should have been stirred up over such a harmless affair. It goes on to recite the well-known figures of Brazilian-American trade, showing how much more the United States buy of Brazil than does Brazil of the United States. Then it adds that already the Brazilian tariff admits free of duty almost all the articles of American export which appear to be most favored by the treaty, such as wheat and machinery, It argues, further, that, in the case of the manufactured articles that are to have the advantage of 25 per cent. reduction from the general tariff rates, the effect upon the Brazilian market is going to be scarcely perceptible. This contention it proves, furthermore, by an array of figures in analysis of the exact effect to be expected from the reduction on American goods. It shows that this reduction applies mostly to articles now taxed at a comparatively low rate in the tariff—from 10 to 20 per cent.—and figures out the real reduction for American exports to be no more than from 3 to 9 per cent. on the total cost. Then it sums up as follows:

> "Any one who knows the prices of the larger part of American products, and who will compare them with similar articles of European manufacture, will find no cause for alarm in the figures we have given, for although it is true that the treaty favors American merchandise, the difference is not enough to make up for the lower prices of European manufactures, and consequently the treaty will not perceptibly or permanently affect our commercial exchanges with Europe."

Very similar is the opinion of the *Rio News*, which says of cotton manufactures:

> "In that particular, our English friends may rest content. The reduction of 25 per cent. will scarcely equalize the original cost to the importer, while the unwillingness of the North Americans to establish commercial houses in Brazil, and to give the customary credits, will destroy the very slight advantage given them by the treaty."

One curious feature of the whole discussion in Brazil is the entire oversight of the fact that we are really making no equivalent concessions to Brazilian exports. Everything that the so-called treaty declares shall be free of duty is made so for all the world by our general tariff. No one knows better than Minister Mendonça that the threat of taxing Brazilian exports by Presidential proclamation, in pursuance of the reciprocity clause in the McKinley Bill, is the merest *brutum fulmen*—especially since last November. In fact, this Brazilian agreement is precisely along the lines of a treaty which Mr. Blaine was prepared to negotiate in case the McKinley Bill did not make sugar free. When sugar was made free, and coffee, hides, and rubber were left free, it was supposed that the treaty had fallen to the ground, as there could no longer be any reason for it. Indeed, Minister Mendonça admitted as much. Why, then, it should have been reverted to in the form of a pure gift from Brazil is a mystery which has not yet been solved. It would not be strange if it should turn out to have been a *quid pro quo* on Fonseca's part, in return for his early recognition by our Government, or some other unknown consideration. What is perfectly clear is, that if it should prove to favor American trade to the extent that has been claimed for it, it will not be allowed to stand by the Brazilian Congress. If, on the other hand, it has no practical effect, as is most likely, it will be looked at with indifference both in Brazil and in Europe.

THE NEW COMMONWEALTH.

The Federation Convention in Sydney, New South Wales, that has just virtually completed its labors by adopting the title of "The Commonwealth of Australia," grew out of the same desire that led to the work of the Philadelphia Convention in 1787—the desire for a more perfect union. The union effected by the act creating the Federal Council in 1885 was weak and inefficient. Not only were the powers of the Council extremely limited, but its membership did not include representatives of all the colonies. Although Southern Australia's reluctance to enter the confederation was soon overcome, that of New Zealand and New South Wales was more persistent. It was contended by the New Zealanders that the 1,200 miles separating them from the Australian continent made closer political connection with their sister colonies impracticable. They feared, too, that the movement was not altogether loyal to the mother country, and they did not wish to take a step that might result in severing their connection with the British crown. The reluctance of New South Wales had a different basis. This colony has pursued, with great advantage to herself, the policy of free trade; in the race for commercial supremacy she has outstripped her strong protectionist neighbor, Victoria. Her fear has been that if she became a member of the confederation, she might be compelled to abandon that part of her policy at least that gave her unrestricted trade with the outside world. Both of these colonies were induced, however, to send delegates to the Sydney Convention, which included delegates from Victoria, Queensland, South Australia, and Tasmania But it still remains to be seen whether the work of the Convention has broken the force of their objections, and whether they will enter the proposed confederation by assenting to the new Constitution.

So far as reported in the despatches to this country, this Constitution is modelled closely on that of the United States. There is a Senate having a territorial basis and a continuous existence; the members are elected for six years, one-half retiring every three years. The membership of the House is based on population and universal suffrage; the term is for three years. There is a Cabinet of seven members, who may sit in either house. The Executive is the appointee of the Crown, but his term of office is not fixed. The judicial system is similar to ours, except that there is an appeal from its decisions to the home Government. Although a desire was manifested in the debates in the Convention to use the Federal Council as a basis for the new government, it appears to have been regarded as too weak and inefficient to serve any useful purpose. It could take original action only on a few subjects, and on other subjects it could

act only when they had been referred to it by the legislatures of at least two States. It had no authority over the commercial relations of the colonies, and was powerless to levy taxes or make appropriations. Under the new Constitution, however, these two subjects are reserved to the National Assembly for original action. Should the Constitution be adopted, this Assembly will probably be called upon to solve the tariff question in such a way as to please Victoria and not offend New South Wales — a task that will undoubtedly tax its wisdom and patience to an extreme degree.

The formation of the Commonwealth, if successfully carried out, as it doubtless will be, foreshadows before many years trouble for both Germany and France in the Southern Pacific. The shortcomings of the mother country in that region which the colonies have felt most keenly have been her acquiescence in the occupation of half the great island of New Guinea by Germany, and her acquiescence in the possession of New Caledonia as a penal station by France. Both these islands are in Australian waters, and Australia owns one-half of New Guinea. Nothing can be more certain than that, as the new Commonwealth grows, notice to quit will be served on both France and Germany, and that somehow the power to enforce it will be provided. One of the many extraordinary things about this new republic is, that the warmth and dryness of the climate have apparently added to instead of diminishing the physical vigor and energy of the original stock. In every athletic sport, and especially in rowing and cricket, the Australians are fully a match for the English, and they occupy a foremost rank among the equestrian races of the world. They not only have the finest bucking horses in the world, but they have the men who can ride them best. That the Commonwealth will turn out as good soldiers and sailors as ever fought by land or sea, there is no doubt whatever, and any Power in the world which tries to stay in the Australasian seas against the will of Australians, when once they begin to feel themselves a nation, will have a very hard time.

THE MAFIA.

ROME, March 20, 1891.

THE recent tragedy at New Orleans furnishes a terrible commentary on the character of the Italian secret societies of which the chief are the Mafia in Sicily and the Camorra in Naples. The Mafia, under one designation or another, runs back into the middle ages. It then punished crimes against itself by the same standards that the Government established, with one exception—it had no degrees of penalty: death was the only punishment it could inflict. A man who had injured one of the Mafiosi had his hand cut off; if he had overheard the secrets of the association he had his ears cut off; and if he had seen too much he had the skin of his forehead flayed and turned down over his eyes—but these were only the tokens of the reasons for his removal: he was killed first and the mutilation was only the intimation to his friends. Under the Bourbons, no measures the civil authorities could employ had the least effect on the organization; its simplest form was brigandage and sequestration of the person, to be held to ransom, default of which implied death. Members of the Mafia in the cities kept watch on the movements of people of wealth, and sent messengers to their colleagues outside to give information of them, so that they might be taken with the least trouble, and the spies had their percentage of the ransom. When Sicily was annexed to Italy, the outlawry was increased by the addition of the partisans of the Bourbons, who pretended to be in insurrection. The disorders were suppressed by the bersaglieri, who scoured the country and tried by drum-head court-martial all the men they caught with arms, or who were accused of brigandage, and shot the condemned on the spot. Since the reëstablishment of the civil law in the island, there has been a slight recrudescence of the Mafia, and a few cases of sequestration of the person, but foreigners have been respected for the most part with great scrupulousness. Minor crimes are still to a large extent protected by the organization, but the policy of the Government has been one of steady legal pressure and change of venue to the continent for the trial of the criminals, and this is gradually paralyzing the Mafia.

The organization is probably stronger to-day in Louisiana than in Sicily, for the active pursuit of the actual offenders has driven many of the worst of them out of the country, and their best field of operations seems to have been our Southern States, whose climate agrees with their habits, and where wealth offers them attractions. It is well known in Italy that the dregs of the criminal population of Sicily and Naples are in Louisiana; and, transplanted to a new and almost virgin soil, where, too, a certain old infirmity of the law has predisposed to violence and short roads to justice, it was certain that the Mafia would become a danger to society. This is so well recognized by reasonable Italians that they admit a palliation for the summary justice of New Orleans, and acknowledge that the case is a difficult one to deal with by strictly lawful means. The first expressions of indignation were naturally very strong, but there is a moderation in the later comments due to the facts having come to knowledge and to previous acquaintance with the *teterrima causa* of conflict.

The flagrantly criminal character of a large portion of the Italian emigration to the Southern States is too well known here to permit their countrymen at home to doubt that the authorities at New Orleans have a knotty problem to deal with in the Mafia, and it is admitted that the extermination of the organization is necessary to order, and that the longer the efficient remedies are neglected the worse the evil will become. The only efficient remedy is the suppression of the Mafia. There is no question that at present the tendency of the criminal classes in the south of Italy, where those classes most abound, is to emigrate to the Southern States of America, and something might be done to check the influx by a law that every immigrant must be furnished with a passport in which his non-responsibility to the Italian law shall be stated and endorsed by the American consul at the port. Every emigrant from Sicily is suspicious, and the authorities, in default of any pressure on the part of the American Government, will take no precaution to prevent a known criminal from escaping to the United States, where he will give the Italian authorities no further trouble. This is natural, but the desire to protect the honest and industrious Italian emigrants to America may induce the King's Government to enter into arrangements which will secure this, and at the same time lead to the discovery of some of the criminals wanted for offences at home.

The honest Sicilian is an emigrant whose value to the United States is great, but the proportion of such in the mass of emigration is very small, and should be looked after. The late and present Prime Ministers of Italy are both Sicilians, as have been many of the ablest statesmen of Italy during the years since the annexation. I have been surprised, in making the acquaintance of the islanders and seeing their work, at their energy and administrative ability, so different from what we are accustomed to associate with the south-Italian mind; but the fact is that they are superior in this respect to the inhabitants of the southern provinces of the peninsula. This, coupled with their prolonged existence under the rule of the Bourbons, which was only the recognition of illegality and official robbery, is probably the cause of the long persistence of the conditions of brigandage and secret organization against the law which have obtained in the island. However this may be, I can assure the people of New Orleans that unless they take some radical measures against the Mafia *as such*, so as to make the belonging to it an offence against the law, they are not likely to suppress it, unless by expelling from the State all Italians—which is more difficult. X.

A DAY WITH FATHER NEWMAN.

MARLESFORD, ENG., March 18, 1891.

IN the autumn of 1859, while crossing the Atlantic from Liverpool to the United States, I made the acquaintance of a compatriot, Father T., who had then for some time been associated with the celebrated Dr. J. H. Newman, subsequently raised to the cardinalate. Both of us intended to return to England in the course of the next spring; and Father T. expressed a hope that, as he was pretty certain of preceding me, I would call on him at Edgbaston, if I chanced to take Birmingham on my way to Southampton and Calcutta.

The following March found me at Birmingham, whence, one morning, after an early breakfast, I drove out to Edgbaston. The servant who answered the bell at the oratory could tell me nothing about Father T., except that he was still away. Unsatisfied with this scanty information, I gave him my card, asking him to go and ascertain, if he could, something more definite. He came back with the message that Dr. Newman wished me to come in.

Despatching my errand to the famous Doctor as expeditiously as I was able, I was about to withdraw, when he requested me to be seated. I accepted his invitation. On my soon again offering to take my leave, I was once more politely detained by him, with the assurance that he was quite at leisure. I resumed my seat.

Since I had spoken of Father T. as my fellow-countryman, Dr. Newman was aware of my nationality. America, its people, and everything relating to both were, evidently, in spite of his perceptible antipathy to them, objects of interest to him. We talked on and on, he putting questions innumerable relative to them, and I replying to the best of my knowledge. Among the various Americans regarding whom he manifested curiosity, Dr. O. A. Brownson seemed to be foremost. Having read all the writings of that indefatigable and ingenious speculator, and being familiar with the history of his multifarious career, I had much to communicate which my interlocu-

tor owned to be new to him. In time, however, our conversation turned to India, where, as I had incidentally mentioned, I had spent a good number of years, including the momentous period of the mutinies of 1857. It turned out that I was the only actual witness of Sepoy atrocities that he had met with; and, before we had done with the subject, he drew from me many particulars of horrors and sufferings which I desired, as I still in vain desire, should pass from my memory. But finally we got on the topic of Hindu philosophy, in the study of which I had of late been zealously engaged. To this my untiring interrogator pinned me for a full hour and more, when, just as I was protesting, with reference to something demanded of me, that the point would require a whole day to develop and expound satisfactorily, the bell rang for dinner. Pressed to accompany him and refresh myself, if I could be content with monastic fare, nothing loth, after the compulsory exhaustion I had undergone, I followed my host to the refectory.

The four sides of the refectory were wainscoted. Near two of them that formed an angle stood small detached tables, each for a single person, with a form behind. The company consisted of nine or ten Fathers of the Oratory and myself. Roast-beef, potatoes, bread, beer, and a plain pudding composed our meal. These were passed from the kitchen through an opening in one side of the room, and were handed round by one Father after another. While we were dining, as if the promotion of dyspepsia were a discipline of piety, strict silence was observed by all, and yet mental entertainment was considerately provided. Diagonally opposite to the corner where the rows of tables met was an ambo, perched in which a young man, habited priest-wise, read for our edification. First he gave us a chapter of the New Testament, of course from the Vulgate. Then followed, also in Latin, legends of several saints commemorated on the day that was passing. Last of all, we were treated to what I recognized as from Carlyle's 'French Revolution.' To that work, certainly, as to many others by the same pyrotechnic rhapsodist, the remark of Lord Macaulay is applicable, that its author "might as well write in Irving's unknown tongue, at once." It appeared to me, then, in no wise singular that Dr. Newman, with his critical sense of good English, after listening for a few minutes to the uncouth and spasmodic jargon that was stunning us, put up his hand, impatiently exclaiming "Sufficit." Carlyle being thus summarily dismissed, we finished our repast without a word spoken by any one.

Thanks being duly transacted, Dr. Newman informed me that "recreation" was next in order. Naturally enough, the term set me conjecturing. I thought of leap-frog, summersaults, hide-and-seek, and sundry other guileless diversions of like kind, though only to reject the idea of them, in favour of no idea whatever. But I was not long held in suspense. Headed by the Doctor, we proceeded to a spacious apartment where a large grate was in full blaze. In front of the fire, chairs were disposed in a semi-circle. We took our seats; and I soon discovered that the "recreation" of my solemn companions was general conversation. And very much indeed, both as to topics and as to tone, was it the conversation of the profane world. Through an aperture in one side of the room, just as in the refectory, creature-comforts were handed in for us; only they were now merely supplementary tea and biscuits. All the waiting was done by Dr. Newman. There being no novelty to me in experience of "the pride that apes humility," so often discernible in professional nuggets of the salt of the earth, this ostentatious exhibition of servitorship did not, I confess, affect me agreeably. Nor did I see anything to admire in an incident which happened while we were sipping our tea. One of the Fathers, finding his cup unpalatable, made a wry face, on noticing which, Dr. Newman seized the cup, and insisted on bringing him another, at the same time patting the fastidious shaveling on the shoulder, and coaxing him, precisely as if he were a little girl in a pet.

The "recreation" in which I participated was, in part, not such as I would have chosen. For many years I had then been accustomed, as I have been accustomed still more years since, to be regarded, because of being an obscure American, as, at best, an anthropical or anthropoidal phenomenon, a creature that must needs speak barbarously, that knew nothing, and that could have no ideas, principles, or aims but the most reprehensible and sordid. When cast among persons who, by their interrogatories or comments, have plainly signified that such was their preconceived estimate of me, I have always been as sparing of speech as was practicable, and, consequently, have been the more free to listen and to reflect. And so it was on the occasion in question. I learned much more from my opinionated inquisitors than they learned from me. And one of the things which I learned was, that Englishmen, in changing from Protestants to Romanists, are the same as ever in the article of ignorance touching Americans, and in the contempt for them which, even to this hour, forms a conventional feature of British tuition. With the patience which abundant demand for practice of it had made easy to me, I once more underwent a diatribe on what were taken for granted to be, without gainsay, the blemishes and shortcomings of my countrymen.

Daylight was disappearing before I left the Oratorians. The impression which they produced on me I lost no time in committing to paper, so that, in recounting it, I am not obliged to depend on recollection. Everything that had passed before me bore, to my apprehension, the stamp of intellectual obliquity, ethical emasculation, grimace, hollowness, or histrionism. All was unreal, and almost all looked insincere. It seemed strange to me, in particular, if Dr. Newman could lastingly influence, in the least degree, any but those who, what between ill-starred idiosyncrasy and irrational tutoring, had ripened into sentimental visionaries and enthusiasts. His allies were, manifestly, men of the same mould as himself; and his deliverance of some morbid half-poetical fancy, or subtile sophism, was what especially excited their delight and elicited their applause. That, like their leader, they were persons grown incapable of seeing truth in a dry light, and that they saw it through a haze of fantastic theory and refracting prejudice, was, to me, a lifelong student of theology, but, for all that, still an unresolved investigator, palpable beyond all mistaking. I had read and reread all that Dr. Newman had published; and the man himself was just what I expected from the author. Lord Macaulay, in one of his Speeches, aptly characterizes the jesuitical "Tract Number Ninety" as "a set of quibbles, under cover of which a divine may hold the worst doctrines of the Church of Rome, and may hold with them the best benefice of the Church of England." The concoctor of that Tract did not, when I was brought face to face with him, disappoint me at all in his favour.

As many are well aware, Mr. Charles Kingsley could easily have produced, if he had but had the patience to search long enough, repeated proofs of the grave disingenuousness which he laid at the door of Dr. Newman. One such proof, unless I am greatly mistaken, offers itself in what is about to be cited, namely, a passage occurring in p. 21 of Dr. Newman's 'Callista,' published in 1856:

"Under the cross were two or three pictures, or, rather, sketches. In the centre stood the Blessed Virgin, with hands spread out in prayer, attended by the holy Apostles Peter and Paul, on her right and left. Under this representation were rudely scratched upon the walls the words 'Advocata nostra,' a title which the earliest antiquity bestows upon her."

An eminent doctor of divinity was once inspired to discharge his spleen on me, as an American, because I approved of the measures taken to restore the integrity of the Union. One day, in conversation with this profound scholar, laying before him the words just quoted, I remarked that the phrase "earliest antiquity" could not there possibly point to any age later than the paulopost-apostolic, and added that, to the best I could discover, the term *advocata* was, at that period, altogether unknown. What ground, then, I went on to ask, was there for the allegation that the primitive Christians gave to the mother of Jesus the epithet "our advocate"? And how, if there was irrecusable authority for that designation of her, could a Protestant that supplemented the New Testament by other recorded traditions deny that he ought to enter the Roman communion? My interlocutor, who had long been an intimate friend of Dr. Newman, gave me no reply. I pressed him for one; and at last he angrily silenced me by saying that I was to submit my difficulty to some one else. If I failed to draw other than uncomplimentary inferences from this evasiveness, it was not for want of trying.

"It may be almost laid down as an historical fact, that the mystical interpretation and orthodoxy will stand or fall together." So writes Dr. Newman, in his 'Essay on the Development of Christian Doctrine'; and the passage is noteworthy, for we see in it a man who deems himself not far from being a prophet, and who, as an arbitrary fantast, takes rank with Origen and Jacob Boehme. Nor did the public misapprehend that he was what he was. Nevertheless, the grief and veneration which, on the announcement of his death, found expression in the English press, could have been foreseen. Those who knew him best have all concurred in representing him as distinguished, constitutionally, by melancholy, superstition, and unreasoning self-will; and he was, thus, except as to his mysticism, typically English. And again, he had rendered himself famous. In our own time, more than was ever the case before, his countrymen stand conspicuous as hero-worshippers; and in him they recognized a hero preëminently sharing their national characteristics. And this was enough to secure for him their reverent homage, though millions of them could not but acknowledge that his aspirations were such as, if realized, would go far to extinguish genuine enlightenment, and would operate to enslave the world once more to the execrable tyranny and the ridiculous mummeries of mendacious and self-seeking priestcraft. F. H.

COLUMBIANA.

FLORENCE, March, 1891.

AT Genoa and here I have been made cognizant of the interest which Italy is of right taking in the approaching anniversary of the discovery of America. I had an interview at Genoa with some of the gentlemen engaged in

the effort which the Italian Government is now committed to make in demonstration of the leading position which Italians gained in the earliest stages of the development of American geography. Every student of that period is impressed with the uncompensated mastery which fell to the lot of Italy in those days, in that she contributed Columbus and Cabot, Vespucius and Verrazzano to the solution of the great cosmographical problem, while she failed to acquire a foothold in the land. It is to make this more abundantly evident that the Italian Government has now planned the publication of a treasury of documentary proofs in indication of her almost supreme share in the great discovery.

While in Paris, I saw in the study of Henry Harrisse the annotations which he had prepared on the 175 documents illustrative of Columbus which are to constitute a section of the great work. It was some time since announced that he was to have the care of this portion on Columbus. It will be remembered that, a year or two ago, Harrisse addressed an open letter to the Government at Rome, urging the official publication of these documents as Italy's contribution to the literature of the coming anniversary. That Government has accepted the suggestion; but, as I have said, it has enlarged its scope by associating with the labors of Columbus those of the other great navigators, which made the part of Italy so conspicuous in the discoveries of that time.

The great need which the student now feels of further elucidation in respect to the career of Columbus is the recovery of the diplomatic correspondence of Spain and Portugal with the Papal Court, which led to the bull of demarcation in 1493. It has long been supposed that the archives of the Vatican would reveal something. The truth is, that, though the doors of that repository have been of late years left ajar, the student makes his researches there under the utmost difficulties. No official warrant gives its bearer unrestricted access, and all that the inquirer can do is to indicate what he wants, and let the custodians, who have no catalogue to aid them, bring what inclination, leisure, or acuteness prompts them to discover. Research by the student himself is in no valid sense yet permissible. Harrisse tells me that he has done the best he could under such restraints to profit from the resources of the Vatican, and he feels quite sure that there are still preserved there no maps or other important papers illustrating the bull of 1493, further than are already known.

The few scholars interested in this field to the extent of appreciating Harrisse's best labors may indeed be counted almost on your fingers, and one could name two or three in Germany and perhaps as many in America, and possibly one or two in France and England. This small body of students have followed his traces, not only in his various monographs, but in sundry periodicals of France, Italy, and Spain for a score of years or more, and know pretty well what he has been doing. His work has no quality for popular recognition, and there has been no demand to translate his studies into English so that his countrymen—for he is an American citizen—could generally appreciate his labors. It will be remembered that, in his 'Vie de Colomb,' he had indicated that he had prepared a full bibliography of the works which had been written exclusively upon Columbus, then numbering about 600. The MS. has since been enlarged and waits now for publication.

Any one who has dealt with the history of the earlier voyages to America, say before 1550—or better before 1525—knows how much depends, in settling some of the questions which surround them, upon the identification of persons often met with in the accounts under names difficult to distinguish. The studies of Harrisse have been helped by the registration which he has been accustomed to make of all these recurrent names, with a reference to the document which contains each one. This material, alphabetized and unified, would be a valuable companion for any students in this field, and it is to be hoped that a publisher can be found for it, as Harrisse has now got it arranged.

The work upon which his attention is now chiefly turned is a history of the discovery of North America. His earlier books on the Cabots, Cortereal, and other of the earliest explorers can be found in a few of our larger libraries, but they have failed of their full purpose, for the reason that what in them attracted a few students rendered an English version of them unadvisable in a publisher's eyes. An English publisher has at last risked the undertaking, and Harrisse is now sending through the press in English a large book which will embrace the material of his earlier French publications, reworked and amplified. I find in talking with him that he expects to have competent critics acknowledge that he has in good measure placed a new significance on much of this early history. He expects that it will be seen that Sebastian Cabot is not deserving of all that has been assigned to him, and that the map in gores which Henry Stevens brought forward a few years ago, as a newly discovered map of Schoner of 1523, and upon which that writer based beliefs which he claimed to be new, was indeed no such map as Stevens had represented. With the map discarded, as Harrisse insists it should be, the theory which Stevens, with his usual airs of superiority, maintained, falls to the ground. Students will eagerly wait to see if this catastrophe to Stevens's critical sagacity is really to happen.

When in London, some weeks ago, I saw at Quaritch's shop the single copy of the folio edition of the Spanish text of Columbus's first letter, which has been recently discovered; and that dealer also gave me the opportunity of going over the evidences that what is claimed as a new quarto edition of the same text is in reality a forgery of a nature to permit various other copies of the same fabrication, now lurking somewhere, to be unearthed again with the same appearance of chance discovery. The copy already made known was somewhat boldly facsimiled in a little publication by the same dealers, so that those suspicious of its genuineness have had something to work upon in their investigations. The alleged original has gone into a collector's library in America. I find that Harrisse has been investigating this dubious edition independently, reaching the same conclusion. He has had photographs made of certain pages of the copy in the Ambrosian Library at Milan—the only Spanish printed text known till recently—but he finds that the fabricators worked not on this copy (as indeed the custodian of that library is willing to swear, since it has not been out of his custody), but upon the facsimile edition of it which was published some years ago. It is claimed by Harrisse that the forgers have in sundry ways been ensnared by the tendencies to which such adventurous inclinations are sure to lead. As I looked upon the proofs of the forgery, both in Paris and in London, there seemed scarcely a doubt that a respectable London dealer unwittingly lent himself to a deceit. I saw the only copy which the makers have as yet dared to put upon the market, when an agent of the London firm laid it before me a year or two ago at Cambridge, Mass.; but he found a purchaser elsewhere.

When at Mentone, I went, by Mr. Hanbury's invitation, to visit his famous garden at La Mortola, just over the Italian line, which has been called the finest private garden in Europe, with its almost unprecedented array of trees and plants brought from every quarter of the globe, and selected for their ability to thrive in the open air in this sheltered nook of the Riviera. I felt the presence of Columbus even in this vestibule of the great peninsula. As Mr. Hanbury led me into his house, he told me that its roof had sheltered those who were born before the great navigator, and on the walls of its porch he had placed a beautiful Florentine mosaic of Marco Polo, which seemed to promote the illusion. His reason for commemorating that traveller was that he was the earliest to bring back from Cathay descriptions of the plants which glorify the East, and which he could point out to me as growing before my eyes. I sooner, however, associated the great Venetian traveller with that account of his travels in Asia written after his return from his long sojourn there, and while imprisoned in the building which the other day I still looked upon in Genoa. It could not be forgotten by any one who knew of that copy of Marco Polo which is preserved in Seville, and marked with annotations in manuscript ascribed to Columbus himself, that the strange marvels of the 'Milione' had had much to do with fostering the adventuresome dreams of the Genoese navigator. As Mr. Hanbury took me to a spot in his grounds where, from a bridge that spanned the chasm, I looked down into a remaining bit of the old and narrow lane, shut in by crumbling and ancient walls, which is all that is here left of the road along the Riviera which the Romans traversed, which Dante describes, and which even Napoleon was not too late to follow when he marched his troops into Italy, I even fancied that Columbus might have thridded its windings along these slopes, either, perchance, when his mule took him from Italy to seek his fortunes among the more western maritime peoples, or when, it may be, he returned by the same route to seek to interest the Genoese in his purposes. There is an interval from 1473 to 1487 when no one can say with absolute certainty where Columbus was or what he was doing, or on what date any supposable venture may be connected with his name. This gives the license which prompted my musings in Mr. Hanbury's garden.

One sees to-day in the municipal palace at Genoa, in the Council Chamber of its Government, and adorning its walls on either side, two superb specimens of the art of the mosaic-maker. One is a portrait of Columbus and the other of Marco Polo. They were the gift of Venice to Genoa in commemoration of the union under which Victor Emanuel and Cavour brought at last the native places of these two great discoverers, and they were fitly associated together in that hour of jubilant patriotism, for Italy in the one had splashed the waters that laved the shores of Cathay, and in the other she had seen the reflections of the tropical verdure of the Antilles.

There are some students of Columbus's career, now in Genoa, who have worked assiduously of late years in delving among the old archives of Liguria, particularly in the notarial records of Genoa and Savona; and foremost among them is probably to be placed the Marquis Marcello Staglieno. Some of them, together with other antiquaries of Rome and Venice, constitute the Committee now royally

charged with the publication of the great documentary work of which I have already made mention. I had in Genoa two interviews with the Cavaliere Cornelio Desimoni, to whom is intrusted the part of this great collection which is to be given to Verrazzano, and whose publications on that navigator some years since procured him recognition among American students of that somewhat obscure theme. There was at one time, after the late Henry C. Murphy had privately printed his iconoclastic monograph on the subject, a tendency to treat the voyage of Verrazzano along our Atlantic seaboard as a myth, and George Bancroft fell into the humor and left out all mention of the voyage in his first revised edition, and did not restore it in the last edition. But the faith of Carson Brevoort, as manifested in his treatise on the voyage, the later exposition of De Costa, and particularly the two publications of Desimoni, when they became known in America, furnished rallying points for the believers; and the map of Maiollo, which Desimoni first made known as among the treasures of the Ambrosian Library, as well as the chart of Hieronymus Verrazzano, have of late years rehabilitated the old story, as detailed in the letter addressed to Francis I. Desimoni tells me that he shall in the new publication repeat all his earlier results, and put the record in shape with something of a final stamp.

I cannot feel sure that all the investigations of Staglieno and others have made it quite certain where Columbus was born, further than it was within the corporate precincts of Genoa. All claims for other regions must surely be dismissed; and there could hardly be a neater bit of antiquarian skill than that which has demonstrated that Columbus's father lived, in the navigator's childhood, in a house which still stands in the narrow Vico Dritto Ponticello, where the tall houses shut out the light far above the passer, in a quarter of the town then frequented by the workers in wool, and near one of the remaining old city gates. The house bears a marble tablet explaining its interest. It is a very narrow structure, two small windows taking a good share of its breadth; and when I saw it the other day the lower story was boarded up, as if some structural changes were going on within. In one of the open spaces not far distant I noticed among the placards on the walls that a play of "Cristoforo Colombo" was announced at one of the theatres in Genoa, and that the public were asked to attend a lecture soon to be delivered upon his career.

The newspapers announced the other day that a portrait of Columbus had just been brought to light in the possession of a family which had acquired it when the gallery was broken up which the historian Paolo Giovio had gathered in his villa on Lake Como. I know nothing more of this alleged discovery than the press has given; but I do not find that the story of such a discovery is credited by such Italian scholars as I have met. That Paolo Giovio—I looked yesterday on his mural statue in the cloisters of San Lorenzo—possessed a likeness of Columbus, and perhaps more than one, which he had added to his collection of Italian celebrities, admits of proof both from the mention of it by contemporaries and from the woodcut bust likeness which he included in his 'Elogia,' published at Florence in 1551, five and forty years after Columbus's death. Giovio could never have seen Columbus, and his collection of portraits could not have been painted for him till long after the great navigator had died. The authenticity of any such likeness is therefore far from proved, and no one has ventured to trace even a story of probability. Indeed, it is far from demonstrable that any likeness whatever was ever painted of the famous Genoese, and there was certainly no period except the few months following his return from his first voyage when there could have been any popular interest in such a picture. Further, there are very few examples of portraits dating back to the later days of the fifteenth century, which have come down to us, and we have no contemporary evidence of any such likeness of Columbus. Still, the known existence of the Giovio picture has instigated many people since that day to associate some canvas or other with it, and the present story of a new discovery of such a likeness is probably due to a new impulse of the same sort, having little more than a fanciful basis.

One looks eagerly for associations with Columbus in Florence, and it is not found more vividly than in the Duomo when we stand beside the meridian line which Toscanelli drew here a few years before he replied to the letter of Columbus, and confirmed the unknown Genoese in the portentous belief that was slowly fructifying in his mind. I could not look to-day on the statue of Vespucius, which stands among the Florentian worthies in the court of the Uffizi, without thinking of that letter which he addressed to his friend in Florence, and which, falling into the hands of that little circle of geographical students at St. Dié, led to the placing of the name of a Florentine upon the Western continent.

JUSTIN WINSOR.

Correspondence.

EGYPTIAN DISCOVERY.

TO THE EDITOR OF THE NATION:

SIR: You may be glad to know of a recent discovery in Egypt made by Mr. Petrie on Wednesday, March 11. He has found at Maydoom the oldest known Egyptian temple and the only Pyramid temple ever found. It is also the only temple of the Old Empire so far known, aside from the "Temple of the Sphinx" at Ghizeh. The building was buried under about forty feet of rubbish (detritus fallen from the Pyramid), and lies directly at the centre of its eastern base, with two round-topped obelisks on the side facing the Pyramid. Obelisks and temple chambers so far entered have the plain undecorated style of the Old Empire, as shown by the Temple of the Sphinx, but hieratic inscriptions in black paint found within fix the name of Seneferoo as builder, and confirm the supposition to this effect hitherto based on the fact that tombs near the Pyramid contain his cartouche. Seneferoo is the king connecting the Third and Fourth Dynasties, and variously placed in either. According to computations of Mariette and Brugsch, the antiquity will be about 4000 B. C., or earlier.

I was visiting Mr. Petrie on the day of the discovery, and he thought then that about two weeks would be required to uncover the temple and ascertain its plan. On the day preceding, the workmen had reached a platform which then appeared to be a causeway terminating with two obelisks at the base of the Pyramid. In the forenoon of Wednesday a workman came to say that an opening had been found under the platform on the side next the Pyramid. This proved to be the top of a doorway choked by detritus, through which Mr. Petrie crawled into an interior of three chambers and discovered the inscriptions mentioned. I had the pleasure of following him. Mr. Petrie thought the apartments had not been previously entered for about three thousand years—that is to say, that the rubbish fallen from the Pyramid had choked the entrance about three thousand years after construction. A friend who was with me noticed on the floor some dried wisps of papyrus, a plant now extinct in Egypt. The chambers thus far found are so filled up that one cannot stand erect in them, and a door at the end of the third chamber is blocked by large stones. Over all lies an enormous mass of detritus whose removal by Arab diggers is now in progress. I had the pleasure next day of carrying the news of Mr. Petrie's find to the gentlemen of the Egypt Exploration Fund at Beni-Hassan, and of witnessing their unaffected delight over it.

Mr. Petrie was good enough to make me acquainted with some of the results of his season's work at Maydoom. They continue for the Fourth Dynasty the observations which he began at Kahun for the Twelfth Dynasty regarding the use of stone implements in Egypt, and are of the first importance for the connection between the "bronze culture" and the age of stone implements in Egypt. Mr. Petrie is the first to make systematic or important observations on this head, as his publication of 'Kahun' sufficiently shows. As it is his habit to publish every season the results of his work for the given season, I will not attempt to anticipate his matter as regards detail.

I am, sir, respectfully yours,

WM. HENRY GOODYEAR.

KENEH, UPPER EGYPT, March 17, 1891.

Notes.

CHARLES SCRIBNER'S SONS have in press 'The Peace of the Church,' six lectures by the Rev. W. R. Huntington; 'The Water Devil, and Other Stories,' by Frank R. Stockton; 'Money: Its Use and Abuse,' by W. Cunningham, in the University Extension series of manuals; and 'Marie Louise, the Return from Elba, and the Hundred Days,' from the French of Imbert de St. Amand.

Forthcoming from the Messrs. Harper are 'Pharaohs, Fellahs, and Explorers,' by Amelia B. Edwards, being the substance of her lectures in this country; 'Recollections of President Lincoln and his Administration,' by Lucius E. Chittenden, formerly Register of the United States Treasury; 'What to Eat and How to Serve It,' by Mrs. Christine Terhune Herrick; and 'A Box of Monkeys, and Other Farces,' by Grace Livingston Furniss.

G. P. Putnam's Sons will publish 'Practical Landscape Gardening,' by Samuel Parsons, jr.; 'A Year in Portugal,' by Dr. George B. Loring, late United States Minister to that country; and 'Recollections and Impressions, 1822-1890,' by O. B. Frothingham. They have also in press a fifth edition of the Rev. J. W. Chadwick's 'Bible of To-day,' with new prefatory matter indicating the advance of criticism since the publication of the first edition in 1878.

'A History of Sicily,' by Edward A. Freeman, and Seyffert's 'Dictionary of Classical Antiquities,' translated by Prof. Nettleship, are announced by Macmillan & Co.

D. C. Heath & Co., Boston, will shortly issue an 'Introduction to Modern French Lyrics,' by Prof. B. L. Bowen of Ohio State University.

Mr. Thomas Willing Balch is about to publish, through Porter & Coates in Philadelphia, a translation of a book published in French by his father, the late Thomas Balch, in Paris, in 1872, 'The French in America during the War

of Independence of the United States, 1777-1783.' It is an account of the part taken by the French corps under Rochambeau, largely drawn from hitherto inedited material. Miss Balch printed in the *Magazine of American History*, in 1877, a translation of an unpublished memoir by the Prince de Broglie, who was here with Lauzun; and her brother proposes following his translation of his father's book with another volume giving the accounts written by Duretit Thouars and others, and a curious collection of Loyalists' Letters, thus adding to our knowledge of the other side in the struggle for independence.

'Ring Riding,' a collection of movements and commands designed for the use of riding-schools and riding-clubs, by Henry W. Struss (D. Appleton & Co.), is a beautifully printed and illustrated little volume. It is exactly what its name implies—a collection of commands—and is not, therefore, a book for reading. But the author has shown admirable judgment in the directions which he has given, both at the beginning and at the end. These are few, but they are plain and simple, and show good sense and a thorough knowledge of his subject. The volume is dedicated to the New York Riding Club, of which the author is a member. The plates illustrating the different movements, 142 in number, are so clear that no one need have any difficulty in seeing for himself how the different evolutions will appear in actual performance. Altogether, the whole thing is thorough, and the paper and style of printing leave nothing to be desired.

Prof. W. G. Hale's 'Art of Reading Latin: How to Teach it' has found an admirer in Prof. J. Keelhoff, professor in the Athénée Royal at Tongres, Belgium, who has obtained leave to translate it. It now appears as 'L'Art de lire le Latin: Comment il faut l'enseigner' (Mons: Hector Manceaux). Prof. Keelhoff pays the further tribute to the Cornell professor of Latin by regarding this little treatise as of real value in the unequal combat the study of the classics is now waging with the modern spirit. In one of his numerous footnotes he mentions the fact that Prof. Hale's 'The *Cum* Constructions' is about to appear in a German translation (Teubner).

Dr. Karl Krumbacher, Privatdocent of Modern Greek in the University of Munich, has published a volume entitled 'Geschichte der byzantischen Literatur von Justinian bis zum Ende des oströmischen Reiches, 527-1453,' in which he gives an admirable sketch of a hitherto rather neglected period of literary history. One is inclined to think of Byzantine literature as chiefly theological and decidedly polemical in character, and consisting, for the most part, of the controversial writings of iconoclasts and iconolaters, who vie with each other in venting sectarian bitterness and personal abuse. But this is true only of what might be called the Byzantine dark ages, extending from the middle of the seventh to the beginning of the ninth century, and followed by a renaissance which bore its richest fruits in the twelfth century. The man who contributed most to this revival of letters was the statesman and courtier Michael Psellos, a writer of keen intellect, remarkable versatility, and vast learning, but excessively vain and utterly selfish and servile—a combination of great and mean qualities, says Krumbacher, which we find five centuries later incarnated anew in Lord Bacon. Krumbacher is exceedingly enthusiastic in praise of Romanós, whom he characterizes as "the greatest sacred poet (*Kirchendichter*) of all ages," and thinks that this foremost place will be assigned to him by "the literary history of the future." The two best manuscripts of Romanós's sacred lyrics are preserved in the library of St. John's cloister on the island of Patmos, where they were copied by Krumbacher some years ago with the intention of publishing a complete edition of his poems.

The *Mittheilungen der Deutschen Gesellschaft für Natur- und Völkerkunde Ostasiens in Tokio* (Band v, Heft 45, Feb., 1891) contains an interesting and scholarly article by Dr. Ludwig Riess on the "Aufstand von Shimbara, 1637-1638." This was a tragic uprising of Japanese Christians against their persecutors, the heathen rulers. Shimbara had been the centre of Christian life in Japan during the last years of the sixteenth century and the early part of the seventeenth century. After enduring many oppressions the Christians revolted. They were besieged for several weeks in Shimbara. At length, in April, 1638, their stronghold was captured. The rebels were slain without mercy, the order having been given that "no Christian should be left alive, neither man, nor woman, nor child, nor sucking babe." In all, 20,000 Christians lost their lives during this rebellion. The besiegers lost about 3,000 men. The suppression of this revolt was the death-blow to Christianity in Japan; it also occasioned the rigid exclusion of the foreign element from Japan's inner life for more than two centuries. Professional narrators ("hanashika") still recount the history of this uprising to the people in the halls of Japan. Dr. Riess gives us the first full critical account of the remarkable event.

Dr. Geo. E. Ellis's "Recollections of Round Hill School," in the April number of the *Educational Review*, convey the impressions made on a boy of twelve by the two principals, Messrs. Cogswell and Bancroft, with a decided preference for the former in the relation of a teacher. One can hardly differ from Dr. Ellis's conclusion that the opposite temperaments and constant variances of these partners had more to do with the school's failure than anything else: Cogswell "always intent on his duty," and Bancroft "apt to be engrossed in some book of his own," near-sighted and hence the target for school-room and even vegetable-garden missiles, distraught and hence eccentric in dress—"the Crittur," in the familiar speech of the pupils.

Prof. Felix E. Schelling issues in the Publications of the University of Pennsylvania (Philadelphia: University of Pennsylvania Press) a paper about 100 pages in length upon the 'Poetic and Verse Criticism of the Reign of Elizabeth.' It is conceived in the style of a German monograph and characterized principally by its fulness of research. The volumes dealt with are not many, but they are more or less obscure, and the questions raised in them regarding the fitness of English for classical measures and the validity of the old English habits of metrical composition are interesting to the student. The main subject, that of the experiments of Gabriel Harvey, Spenser, and Sir Philip Sidney, has often been treated, and its features are generally well known to students of our literature; but in this volume there is a convenient résumé of the remarks on English versification by Gascoigne, Webbe, Puttenham, Campion, and Daniel, with some notes on Gosson and Lodge in connection with Sidney's 'Apology.' The paper shows more capacity for learning than for literary criticism, but, within its range, is thorough, painstaking, and scholarly. The lack of any table of contents, or headings to the divisions of the text, or index of contents is an inexcusable blemish in a work which might otherwise be useful for reference.

Mr. Henry F. Waters's "Genealogical Gleanings in England" in the April number of the *New England Historical and Genealogical Register* deal with the wills of benefactors of Harvard College. The Holworthy connection is developed in Mr. Waters's characteristic manner by means of abstracts of wills of sundry merchants, gentlemen, and knights of the name, as well as of collateral Mans, Kitchens, Colstons, Pitts, Havilands, Fowneses, and Launces. Other benefactors thus brought to view are Pennoyers, Disbrowes, Hobsons, Foords, Bridgeses, Hultons, and Holdens.

We have on our table the first number of *Engineering*, a popular illustrated monthly magazine "devoted to industrial progress" and published in this city. Its contents are decidedly readable. Ten signed papers by contributors are followed by summaries of current intelligence under the headings Civil Engineering, Architecture, Electricity, Mining and Metallurgy, Mechanics, and Popular Miscellany. We acknowledge also the April number of Mr. Stead's *Review of Reviews* in the American issue edited "coöperatively" by Mr. Albert Shaw. The mechanical execution appears to be better than in the case of the English edition.

The April number of *Sun and Shade* (N. Y. Photo-Gravure Co.) has for its most noticeable plates a portrait of Gen. Sherman, and three very interesting and truly picturesque views of positions held by both sides in the battle of Gettysburg.

Prof. A. de Gubernatis's 'Dictionnaire International des Écrivains du Jour' (Florence: Louis Niccolai) comes to an end with the nineteenth *livraison*, which has a considerable list of additions and corrections, and another of the writers who have died during the progress of the work. We have not been able to praise this dictionary as we could have wished, but, with all its imperfections, it is still, if only in virtue of its recent date and its inclusiveness, a book of reference which most libraries will feel bound to procure and which will be of great convenience to journalists.

The Russian Empire is twice mapped in the twenty-eighth part of the new Stieler's Atlas (Westermann); once by itself and once as a portion of the Asiatic continent. The third plate represents the Ægean Sea and Archipelago.

The departure of Sir Henry Loch, the High Commissioner of South Africa, and Mr. Rhodes, the Premier of Cape Colony, who have been consulting with Lord Salisbury in regard to the relations of Portugal and Great Britain in South Africa, and of the South African colonies to the mother country, enables the London *Times* to summarize the outcome of the negotiations. There is reason to believe that no compromise or concessions will be made to Portugal, and that the abortive agreement of August 20, 1890, will remain in force until it lapses on May 20, "except that the 33d degree east of Greenwich has been laid down as the limit on the Manica side, with the exception of a patch at Massi Kessé." To this arrangement the Portuguese ambassador is ready to agree, but, so far, the Lisbon Ministry have declined to give their assent. It is very distinctly intimated that if Portugal should endeavor to prevent the passage of miners and settlers through her territory to Mashonaland, it will be of no avail, and that within two years a railroad to connect this country with the east coast will be well on the way, with or without Portugal's consent. Nothing definite can be said yet in regard to the gold resources of this region, as stamping ma-

chinery has not been put in operation. But other enterprises, as sheep and cattle-raising, have been introduced, with every prospect of ultimate success, as much of the plateau is fine grazing land. South of the Zambesi the country is under the jurisdiction of the High Commissioner. Northern Zambesia, as far as the German sphere of influence and the Congo Free State, Mr. H. H. Johnston, the well-known traveller, will administer as an imperial officer.

Macmillan & Bowes, Cambridge, England, send us Part A of a 'Catalogue of Books Printed at or Relating to the University, Town, or County of Cambridge,' which they have been collecting for nearly twenty years and would now prefer to sell *en bloc*. As far as it goes the list has been made bibliographically full so as to be valuable for its own sake. There are 347 numbers.

A Summer School of Applied Ethics is to be held for six weeks, beginning in July, at some summer resort in New England or New York, not yet designated, with a view to the "wants of clergymen, teachers, journalists, philanthropists, and others." The dean of the school is Prof. H. C. Adams of the University of Michigan, with address at 1602 Chestnut Street, Philadelphia, who will have charge of the Department of Economics, delivering eighteen lectures himself. Prof. Toy of Harvard will preside over the history of religions, and Prof. Felix Adler over ethics. The outlook for solid intellectual profit is, considering the collaboration (which we cannot specify here), extremely promising.

—We said last week, apropos of the piracy of Bryce's 'American Commonwealth,' that "Funk & Wagnalls have . . . come out in competition with Sergel & Co.," the Chicago marauders. This is true, but in a sense different from what we intended, for our better information shows that the New York firm is pushing a cheap *authorized* edition by an arrangement with Mr. Bryce's publishers. It is needless to say that we regret our error, but our readers are well aware of the reasons which made it both possible and natural to think Messrs. Funk & Wagnalls capable of the action imputed to them.

—Nearly one-half of the April number of the *Quarterly Journal of Economics* is given up to the Residualists. These are a class of economists (they can hardly be called a school as yet) who seek to weigh and measure rent, wages, interest and profits as the mathematician arrives at the value of three or more unknown quantities, by elimination. Ricardo led the way in this field; and his conclusion, that wages and profits are the leavings of each other, is perhaps the least satisfactory of his theses. To Gen. Walker belongs the credit of starting the modern class of Residualists, and it is a peculiarity of the class that most of those who have entered it have applied themselves to the task of overthrowing the positions of its founder, while following his methods. A few people may understand these discussions, but fewer, we think, can enjoy them. We are very sure that political economy gains nothing in popular appreciation by them. In the "Notes and Memoranda," Mr. Hugo Bilgram complains of Prof. Giddings's obscurity of language, and Prof. Simon N. Patten complains of his own, which he ascribes to the paucity of economic terms. No such difficulty presents itself to Prof. John B. Clark, who concludes his paper on "Distribution as Determined by Rent" with these words:

"Here again we are nearing deep water. We can see that the sacrifice of deferring enjoyment is, like that of labor itself, a second basis for measuring values. Every subjective utility has its equivalent of the one kind as well as of the other; and the psychological currency that ultimately measures all values is inherently bimetallic. It is composed of two disutilities, both of which are distinctively social, or of two sacrifices made, in each case, not by particular men, but by an entire social force. What all laborers sacrifice in supplying the minute fraction of the day's work that lies just within the line of equilibrium that we have traced, also what all capitalists sacrifice in submitting to that final bit of abstaining or waiting that lies just within their own collective line of equilibrium—these constitute the subjective double standard on which all measurements of value rest."

Here Prof. Patten may see that the terminology of the science is not so meagre as he had imagined. Of Prof. Clark it may be said that all is rent that comes to his net. Rent is rent, wages is rent, interest is rent, and profit is rent. Both production and consumption are rent if rightly considered.

—In a different style is Dr. Adolf Wagner's critique of Marshall's 'Principles of Economics,' in which not a paragraph can be found that requires a second reading in order to comprehend its exact import. Dr. Wagner awards high praise to Marshall, and in so doing administers some raps on the knuckles to those members of the German historical school who adopt a condescending tone towards Adam Smith, Malthus, Ricardo, and Mill. Perhaps the most notable part of Wagner's paper is that in which he upholds in the main the cost-of-production theory as the determinant of value, while conceding something to the later opposing views of Jevons, Menger, and Boehm Bawerk. Dr. Charles Gross's 'The Gild Merchant' receives hearty commendation from Mr. Wm. Cunningham of Trinity College, Cambridge.

—In 1884 the Massachusetts Legislature authorized the preparation of a topographical map of the State jointly with the United States Geological Survey; the State to pay $40,000 for its share of the field-work, and to be at no expense for engraving, but to have the right to reprints of the map sheets at cost. The State was represented by a commission consisting of President F. A. Walker of the Massachusetts Institute of Technology, Mr. H. L. Whiting of the United States Coast Survey, and Prof. N. S. Shaler of Harvard College. During the progress of the survey, it was found that the definition of town boundaries throughout the State was so imperfect that an additional appropriation was secured to establish them in more permanent form. The field-work was finished a year or more ago, and now the entire atlas of fifty-four sheets is issued at the extremely moderate cost of six dollars, with index and portfolio cover. If bought singly, the sheets cost fifteen cents a piece. It may be had at the office of the Commissioners, Commonwealth Building, Boston. Massachusetts is thus the second of the Eastern States to provide a map of some topographic accuracy, obtainable at low price, and in form adapted to very general use. New Jersey is ahead in this respect; its atlas includes a shaded relief map of the entire State, and a colored geological map on single sheets, the whole consisting of twenty large sheets, costing but five dollars. A reduction of the Massachusetts map has been prepared at Washington on four sheets with contours, on a scale of about four miles to an inch; but this is without shading to indicate relief and it is not included in the State atlas.

—The single sheets, of which fifty-four cover the State, each embrace an area of about a hundred and twenty square miles, being bounded by even quarter-degree lines of latitude and longitude, following in this respect a scheme that will eventually be extended over the whole country. The scale is 1-62,500, or close to an inch to a mile—a very useful, sufficient, and intelligent scale for general purposes, although not large enough for the needs of the more exacting students or experts in various lines of professional work. The topographic relief is indicated by brown contour lines at twenty-foot intervals, except on the Williamstown sheet, where the bold slopes of Greylock required the omission of every other line—an unfortunate necessity, as it gives a deceptive impression when the maps are joined together. The general plateau-like quality of western Massachusetts is clearly brought out by a survey of this kind, and the contrast is strongly drawn between the open valley of the Connecticut and the gorges of the Westfield or Deerfield Rivers. Water is printed in blue; boundaries, railroads, towns, and names in black. The map should have a large sale in a State as intelligent as Massachusetts, and when its value is thus widely perceived, we trust that there will be a demand for a shaded relief-map of the State as a whole, on a smaller scale, and that every school in the State will be supplied with this relief map and with its own local sheet at State expense. In this connection, it may be mentioned that similar surveys have been completed of Connecticut and Rhode Island, and that the published sheets of those States may be soon expected. A neat account of the Connecticut survey, with elementary description of its methods, has been prepared by one of the Commissioners of that State, Dr. J. H. Chapin, and published lately by the Scientific Association of Meriden, Conn., in its Transactions, with an outline map, showing the triangulation and the division of the State into map-sheets. It may doubtless be obtained for the asking by those who are interested in this line of our advance in civilization.

—M. Salomon Reinach contributes to the *Gazette des Beaux-Arts* a most interesting dissertation on one of the treasures of the Museum of the Louvre, the Victory of Samothrace. This marvellous statue, which can only be classed with the so-called Venus of Melos, and which possesses the same quality of intense perception of sensuous beauty, must distinctly be assigned to the same artistic movement if a little later and further removed from the severity of the Phidian standard. Like the Melian statue, it will serve for long discussions and antagonistic theories which may never find an authoritative solution. Unlike it, however, it is draped to the throat, and in the subtle and masterly modelling of the body under the drapery it suggests the little Victory of the temple of Nike Apteros, who stoops to untie her sandals, showing the entire figure through the stuff of her robes. Its discovery in 1863 was due to one of those active, quick-witted consuls whom France, under all régimes, has always sent to Eastern ports, and who seem always to have an eye on the Louvre. Found in fragments, lacking still the head and arms, it has been put together skilfully, and later researches on the locality where it was found have identified the remains of the monument to which it belonged. Its reconstruction on one of the landings of the *escalier d'honneur* of the Louvre on the original pedestal, the reproduction of the prow of a galley, gives it a romantic interest which the mystery surrounding the original home of its elder sister of Melos does not compensate for. The con-

jecture that it is the monument erected by Demetrius Poliorcetes to commemorate his victory over the fleet of Ptolemy, the son of Lagos, in the waters of Cyprus, has been advanced, but the date of 306 B. C. seems too late for a work which approaches so nearly in its character to the school of Scopas, and which in several respects is surpassed by nothing we possess of Greek art. The heliogravure illustration to the article in the *Gazette* is excellent, with the grave fault of all the plates of Dujardin that he paints out the background of the figure instead of photographing it against a whi'e screen; the painting out, however well done, impeaching, if not falsifying, the outline of every figure and destroying the roundness and relief of the photograph in any case. This gives it the effect of being cut out in tin. A photograph with a painted-out background or sky ceases to be a scientific document.

—We owe also to M. Reinach a catalogue of the Museum of National Antiquities at S. Germain-en-Laye, quite worthy the Museum itself, one of the best organized and most instructive in Europe. The catalogue, by the fulness and lucidity of its descriptions, comments, and annotations, becomes a hand-book of the prehistoric and Roman archæology of France. The thoroughness of the work may be judged from the fact that the catalogue of 202 pp. has an index of 27. The excellent idea of establishing, side by side with the antiquities of Gaul proper, a hall for comparisons in which may be studied objects from other countries analogous to the former, has been most effectively helped out by the commentations of the catalogue; and fifteen pages are given to the collection of text-books referring to the collection, and of utility to the student of it, in the library of the Museum.

—The Journal of the Historical Society of the Imperial University of Japan, in Tokio, has reached us, and its fourteen numbers are furnished with an index which shows at a glance the richness of the contents. In a supplementary number are included the names of members with their addresses. Among the most prominent are those of the President, Professors Shigéno Antaku and Kato Hiroyuki, President of the University, the Japanese Minister to Austria, the editor of the *Economic Magazine*, and a number of Japanese graduates of American colleges and European universities. Among the foreign names we find those of one or two Americans, and the total membership is one hundred and eighty-one. There are few or no drones in the hive, for we notice that every number has articles, proofs, verifications, authorities, queries, or miscellaneous matter, by which many names are represented. Of the four departments the first is devoted to addresses, etc., the second to old writings or history proper, the third to criticism, and the fourth to contemporary politics and economics. Not a few of the articles are of interest to dwellers in what we may now call palæo-Christendom, in distinction from the neo-Christendom which is the growth chiefly of this century. In illustration of the general theme of the Roman Catholic Missions in Japan in the sixteenth and seventeenth centuries are essays, narrations, and many official and other old documents never before published. Among these papers are Christian Inquisition in the time of the Bakufu (or Shogunate), Letter of Daté Masamuné to Philip III. of Spain, and the Rebellion at Shimabara. Other interesting papers treat of the origin of Japanese letters, of Toyotomi Hidéyoshi, of the Japanese race and language, of the burning question of extra-territoriality, of castle buildings, of the decisive battle of Sékigahara in 1600, which settled the destinies of Japan for a quarter of a millennium; the origin of the *eta*, or pariahs, restored to citizenship by the Mikado in 1872, besides many interesting questions and answers. The flourishing state of this historical society is both a cause and an effect of the great interest in the study of history now so noticeable in Japan. The critical age, and the time of reconstruction as well as of demolition, has come. Certain it is that Japanese history is written in a manner almost totally different from the style in vogue for centuries, when the making either of dry annals or the romances called history occupied those who passed for historiographers. Even the works accepted as classic are now being scrutinized, and among the most interesting papers in the Society's Journal is one on the errors and omissions of the 'Tai Héi Ki,' a standard work describing the middle ages in Japan and the great Héi or Taira family. It is to be hoped that a selection of the best papers of the Society will be published in English.

GROSS'S GILD MERCHANT.

The Gild Merchant: A Contribution to British Municipal History. By Charles Gross, Ph.D., Instructor in History, Harvard University. Oxford: Clarendon Press; New York: Macmillan. 1890.

MUNICIPAL history in Great Britain, as elsewhere, until recently has largely been in the hands of the antiquarians. The historians of the classical school preferred the broader field of national life, while the institutional historians of the last half century have for the most part devoted their investigations to tracing the growth of the living and conspicuous features of modern states. But as the animating spirit and method of modern science take a larger hold on historical students, the almost unexplored field of local institutions, dead and living, the deep foundations of the modern social system, will be subjected to critical and detailed analysis. Until this is done our constitutional histories, however carefully elaborated, must be tentative. The antiquarian's studies have been too often dominated by an honest zeal to prove that his town is of "Roman origin," or "a very ancient borough," and by an enthusiasm for genealogies and epitaphs rather than by the aims of true scientific inquiry. Consequently the accounts of institutions in the conventional local history are often both vague and erroneous. It is a source of legitimate pride that an epoch-making work in this field should come from the hands of a young American scholar.

Dr. Gross's inaugural dissertation, 'Gilda Mercatoria,' published eight years ago, was generally recognized from the first to be the best existing discussion of this feature of English town life in the Middle Ages. That pamphlet of one hundred pages was based chiefly upon printed sources. Several years of painstaking research in England have enabled Dr. Gross to reissue it in an enlarged form, incorporating the results of extended study of manuscript records, with a rich collection of documents as proofs and illustrations and a number of valuable essays on collateral topics. The list of authorities appended to the earlier work contains a few more than two hundred titles, while the list of 'The Gild Merchant' contains more than nine hundred. In connection with this, Dr. Gross has compiled a comprehensive bibliography of British municipal history of about four thousand titles, accompanied by a critical survey of the whole literature, which will be printed if sufficient interest is elicited. These facts indicate vividly the range of study and patient investigation of the years of the development of the 'Gilda Mercatoria' into 'The Gild Merchant.'

Brentano and his followers trace the origin of town government to the frith-gilds, which, in their view, comprised the whole body of the citizens. The regulations of this protective association became the law of the town. From this gild developed the later municipality. As the towns became commercial, the gild assumed the character of a merchant gild; with the expansion of the town, the primary gild became exclusive, and rival ones were formed; but, these finally fusing with the old fraternity, the united body governed the town and formed the basis of the later burghal constitution. Thus the Gild Merchant is viewed as practically identical with the borough. This conclusion Dr. Gross completely overthrows with a wealth of evidence that is almost embarrassing. He has discovered the existence of the Gild Merchant in 102 towns in England, in 30 towns in Wales, and in 38 towns in Ireland. The history of ninety-three of these Gilds Merchant is more or less fully illustrated by the documents in his second volume. The essential feature of this organization is well brought out in these words from one of the Harley MSS. relating to Chester: "A Guylde Marcatorie, viz., a brotherhood, of which companie whosoe were not could not use trafficke or trade within ye Cittie." In brief, it was that department of the town administration which controlled its commercial life and kept a careful eye upon the preservation of its monopoly of trading rights. Within the Gild equality of rights prevailed, outside it, no rights of trade existed. The institution cannot be definitely traced back of the Conquest. In the reign of Henry I. it appears in several charters, as one of the franchises included under the more general title, a "free borough." As the privilege of *firma burgi* commuted for a definite payment tolls, court perquisites, and dues owed to the feudal lord, so the grant of a Gild Merchant transferred the control of the trade of the town from its lord to a body of the citizens. Before the grant all traders paid dues to the lord; after it all citizens who engaged in trade were members of the Gild Merchant. As such they generally enjoyed free trade after meeting their assessments, while all traders not citizens could trade, apart from special occasions like fairs, only by securing licenses and upon the payment of heavy dues to the Gild Merchant.

All traders, citizens or aliens, were, as traders, under the jurisdiction of this body. It was not identical with the town government, for not all the burgesses were members of it, and on its rolls were to be found the names of non-residents. It was, however, an inseparable part of the town administration, and in some towns seems to have been the predominant element in the government. Membership was heritable, or could be acquired as a gift from a friend, subject to the approval of the body; but the ordinary method was election. The Gild Merchant exercised its rights of monopoly, and tried the experiment of developing trade by restriction to the utmost. It did not stop with the protection of its members from outside competition, but suppressed all speculation within. The attempt was made to abolish middlemen, and to create perfect equality of conditions for every member. In Dublin and elsewhere some of the features of the modern Trust are foreshadowed in the rather elaborate pooling of all business. Dr.

Gross attributes the decay of the ancient trading towns and the early growth of Birmingham, Manchester, and Leeds, which had no monopoly, to this stifling policy. So late as 1766, the authorities of Chester attempted to enforce the old monopoly, and to restrict all retail trade to citizens "free of the said city."

A few particulars of Gild action from the many to be found in the "proofs" may be cited. In Bristol and some other coast towns foreigners could retail from ships in the harbor. The Bristol Gild Merchant made liberal appropriations to the public works of the city. In Coventry the Gild, among its other functions, plays the part of a loan association and aid society. To unfortunate but deserving members it would lend money without interest for a year or two. In Dublin, members were forbidden to sue each other at law, and all grievances must be submitted to a committee of arbitration. In Guildford in 1361 the Gild paid the members of Parliament. At this time the regular rate was two shillings per day, but Bishop Stubbs tells us that constituents sometimes bargained with members to do it for less. Guildford may be an instance of such frugality, for the Guildford members received only twelve pence.

The indications that in the twelfth and thirteenth centuries the Gild and borough were not identical have been mentioned, but, as time goes on, a tendency to amalgamation is observable. The same men control both organizations, and the borough gradually absorbs the functions of the Gild, which finally becomes the mere skeleton of a dead institution. The process is so marked in the fourteenth century that it is not strange that some writers have identified the two bodies in their earlier history. To their early relations Dr. Gross devotes a chapter, and clearly shows that Brentano and others who identify the bodies, have been misled by too great reliance upon the Continental analogies and the assumption that London was a typical English town. Behind this assumption were the two others, viz., that the Cnihten Gild of London was a Gild Merchant, and that it was the governing body of London. Our knowledge of this Cnihten Gild is vague, and we can be certain of no more than that the Cnihts were burgesses and their body an influential fraternity. The existence of a typical Gild Merchant in London cannot be proved, and in some other respects the municipal history of London is anomalous.

The origin of the borough, according to Dr. Gross, lay in "expansion of a township or the union of two or more townships," whereby the larger community secured a jurisdiction of its own which mere townships, being subject to the courts of the hundred and the shire, did not enjoy. "The Gild Merchant in early times had no connection with the borough motes (courts, leets, etc.)," which were the essence of the original municipal polity. In most towns holding of a bishop, abbot, or baron, the courts were under the control of bailiffs appointed by the lord. In such towns the citizens, looking for some organ for their citizenly activities, not having the courts under their control as did citizens of royal boroughs, naturally turned to the Gild Merchant, which would thereby become the centre of civic life. The prominence of the Gild Merchant in such cases, owing to especial conditions, has lent a fallacious support to the theory that the Gild was the basis of the borough. The influence of the Gild is to be seen not in the origin but in the development of the municipal constitution. As one of the chief privileges of the *Liber Burgus* of the twelfth and thirteenth centuries, "it aided in evolving the later legal idea of technical municipal incorporation, but was never actually equivalent to the latter." In the earlier period artisans were admitted into the Gild Merchant, but in striking contrast to the state of things on this continent, we find no struggles between the artisans and the merchants resulting in the extension of democratic principles. In England the development of municipal life was towards oligarchy, and instead of the power passing from the merchant burgesses to the artisans, it passed from the burgesses to a "select" body. There are instances of contests between this governing council and the citizens at large. As the towns increased in size, it became usual for the artisans to organize subsidiary bodies or craft gilds which in their development drew the life out of the Gild Merchant. The older body, therefore, retained its power longer in smaller towns. Dr. Gross conjectures that the absence of a Gild Merchant in London may be explained in this way. The rapid growth of the city had produced a network of craft gilds earlier than elsewhere, and so the field of the Gild Merchant was occupied before the period of its organization opened.

Some writers have confused the later mercantile companies with the Gild Merchant. There seems to be no genetic connection between them, although there is a similarity in their functions, particularly as regards the monopoly of trade. The new companies were restricted to merchants proper, while the older body included artisans and farmers as well. As late as 1771 we find the Grocers' Company of Alnwick trying to enforce their monopoly by prosecuting two persons for using the art or mystery of grocer. The later companies of Merchant Adventurers are still more sharply to be distinguished. Their field was exclusively foreign trade. Reviewing the history of the Gild Merchant, it is seen to divide naturally into three periods: during the first it is probably a private society; during the second it is an important and constituent element of burghal government; the third period is one of absorption into the burghal organization, and begins in the fourteenth century.

Nothing thus far has been said of Scotland. As the municipal life of Scotland followed the line of Continental rather than of English development, Dr. Gross found a separate discussion advisable. We can only give his most important conclusions. He has found traces of the "Gildry," as the body is called in Scotland, in sixty-six towns, in forty-three of which either the Gildry or its chief officer still exists. This survival of the Gildry "as a separate but constituent part of the burghal administration down to the present day," and the prevalence of conflicts between the Gildry and the artisans, are the most striking differences between it and the English Gild Merchant. Traces of conflict between the Gildry and the artisans are found in more than twenty towns.

The Gild Merchant of the Continental cities is briefly discussed, and found to correspond "to the later civic mercantile fraternities of England established either for f reign commerce or to regulate a particular part of the local trade monopoly." Leading scholars are abandoning the view that on the Continent the Gild and borough were identical. Illustrative documents are given of the Gild in twelve cities. We note an error in explaining the regulations of St. Omer. In the sentence, "Si quis scacchas aut patinos in gildhalla attulerit dimidiam unciam argenti dabit," etc., the word *scacchas* is defined in the glossary as 'chess,' and one is left to wonder why chess and clogs were forbidden in the same sentence. The word for chess is properly *scacci; scaccae* means either crutches, stilts, or skates. The corresponding French words are *échecs* and *échasses*. *Scaccae* is the Latin of the Flemish *Schaetse* and the English "scatches." To illustrate the Gilds of Florence, Dr. Gross quotes from Macchiavelli's History, book iii., chapter xii, attaching the date 1378. This is a notable exception to his uniform practice; elsewhere the date is that of the document, and the document is contemporary. In this instance the date 1378 is merely the date of certain events which led Macchiavelli into a digression on the Florentine Gilds. The essential features of the Gilds as he describes them date from 1266 and 1282 ff. As Macchiavelli is in no sense a contemporary, we see no reason for quoting him rather than Capponi or Perrens. In Capponi's second volume, on the other hand, p. 483, there is a document of the year 1378 with definite references to the "Consiliarii Mercantie et Universitatis Mercatorum," and to the "Curia Mercantie et Universitatis Mercatorum," which throw more light, dim though it be, on the Gild Merchant than Macchiavelli's description of the crafts. As far as they are concerned, in the same volume of Capponi, p. 524-5, is a passage from Goro Dati containing a contemporary account of the *arti* early in the fifteenth century which would be preferable to Macchiavelli's.

Dr. Gross devotes a short appendix to the term *Hansa*, which appears frequently in charters in connection with the Gild Merchant, as *gildam mercatoriam cum hansa* (or *et hansam*). Pauli seems to have met with it only four times, and Merewether and Stephens confound it with the Teutonic Hanse of Germans trading in England. Dr. Gross gives a list of forty-five charters containing the expression, which appears to mean an exaction imposed as an entrance fee, or upon non-gildsmen as a license fee for trading. *Gilda Mercatoria cum hansa* probably meant that the Gild Merchant was granted the right to levy fees from Gild members as from non-gildsmen for trading in town. Sometimes *hansa* seems synonymous with *Gilda Mercatoria*.

In an appendix of about forty pages, Dr. Gross throws a flood of light upon a most interesting feature of mediæval town polity, the affiliation of boroughs in the twelfth and thirteenth centuries. If a village desired the franchise of a borough, its first step was to look among its free neighbors for a model constitution. Finding one suited to its needs, it offered its lord a payment for the grant of a similar charter. In 1199 Gloucester paid the King 200 marks for the liberties enjoyed by Winchester. An already free borough might change its charter for one of a more developed type. Dr. Gross has tabulated with exact references about 190 cases of affiliation. London was the parent town or model directly for 28 towns in different parts of the kingdom, Winchester for 23, Bristol for some 31 in Ireland, Hereford for 18 in Wales, and Newcastle for 7 in Scotland. It thus appears that there were centres of radiation in the expansion of municipal rights. The indirect relationships were more complex: Bristol and Winchester were affiliated to London, while Hereford and Dublin, a parent of ten Irish towns, were affiliated to Bristol. When a town had secured the liberties of any given borough, it promptly sent to its "metropolis" for specifications of its rights. Subsequently, in cases of disputed interpretation, reference was had to the records of the mother town for an authoritative interpretation. Favorable circumstances might have developed this kind of consultation into regular appellate jurisdiction,

but the mother town in England never became anything more than a court of consultation. It had no powers over the daughter town.

On the Continent, however, the relation developed fully and logically, and the mother town became a regular court of appeal. In France the most important mother towns were Beauvais, Rouen, Laon, and Beaumont, each having about a half dozen *filiales*. In 1303 Bruges was the *hoofd*, or parent, of twenty-seven towns. In Germany, Cologne, Magdeburg, Soest, Lübeck, and Frankfort had a wide range of dependencies—Lübeck more than one hundred, and Frankfort some three hundred. The principal *Oberhöfe* in Germany lasted into the sixteenth century, but finally gave way to the tribunals of the ruling princes in matters of appeal, and to the law faculties of the Universities in matters of consultation. Lübeck acted as *Oberhof* for the last time in 1721. Affiliation was prevalent also in Spain. The most picturesque instance in history occurs in 1338, when Rome sends to Florence to ask the Commune for "gli ordini della giustizia." The pro-slavery fanatics in the Kansas Legislature of 1855 little thought that, in adopting *en bloc* almost the whole body of Missouri statutes, they were following an ancient precedent, universally prevalent in the Middle Ages, which had been of inestimable service in the extension of constitutional rights.

In this review of Dr. Gross's work it has been possible to notice but a small portion of the interesting material that he has collected. The notes to volume first are exceedingly valuable to the student, and contain a mass of digested information, while the documents of volume second form a collection indispensable to all students of mediæval English town life. In the charters we find Latin used as late as 1686 (Berwick), and English as early as the fourteenth century (Winchester), with Latin greatly predominating. French, "after the scole of Stratford atte Bowe," appears occasionally, and notably in the long body of rules of the Southampton Gild of the fourteenth century. The use of the word "Capitolium" for "le Guilde Hall" in an Ipswich document of the fifteenth century is a rather interesting parallel of the modern Americanism, "capitol." These two volumes, in fine, with their apparatus of notes, bibliography, glossary, and index, form a monograph of the highest value, and exhibit the modern critical study of institutions at its best. Dr. Gross is eminently sober and cautious, he has no vagaries, his position is based on and defended by contemporary documents, and he demands the same rigorous proofs from others. He has little patience with Brentano's confident generalizations, which often rest on a "probably" of Madox. We sincerely hope that he will be able to prosecute his studies for many years in the field of British municipal history, which he has made peculiarly his own, and in which he has securely established himself as one of the very first authorities.

THE BELKNAP PAPERS.

Collections of the Massachusetts Historical Society. Sixth Series. Vol. IV. Boston. 1891.

The Massachusetts Historical Society, in 1877 and 1878, published two volumes of "Belknap Papers" from manuscripts found in its cabinets, consisting mainly of letters between the Rev. Jeremy Belknap, D.D., of Dover, N. H., the author of a history of New Hampshire, and Ebenezer Hazard of Philadelphia, Postmaster-General under the old Confederation, and editor of the historical collections known by his name. Though these letters grew out of the historical and literary projects of the writers, they throw much light upon a great variety of subjects between 1779 and 1798.

On the recent celebration of the centennial of its formation, in which Dr. Belknap had the chief share, the Society published a third volume supplementing the former volumes, and covering the period 1766–1798, containing letters (with some other documents) written to Dr. Belknap by many people of distinction, among whom were John and Abigail Adams, the Rev. Joseph Buckminster, Mathew Carey, Dr. Manasseh Cutler, Ebeling of Hamburg, Dr. John Eliot, Dr. William Gordon, Dr. Moses Hemmenway, Gen. Lincoln, Dr. Jedidiah Morse, Dr. Ramsay, Dr. Rush, Noah Webster, Sir John Wentworth, and Paine Wingate.

The earlier volumes give the Belknap-Hazard correspondence substantially complete, though the two parts of it were not brought together until more than fifty years after they were written. But few of Dr. Belknap's letters appear in the present volume, for he seldom kept copies, and the originals are now too widely scattered, even if they exist, to be recovered. This is regrettable, since anything from Dr. Belknap's pen would be of value. For while he is hardly to be classed with great men, or even with great historians, yet as an all-round man he had few superiors in New England, and with a suitable theme and more favorable opportunities he might have written a great history. As it was, De Tocqueville said of his 'History of New Hampshire,' that the reader would find in it "more general ideas and more strength of thought than are to be found in the American historians even to the present day [1848]"; and modern writers, after thorough investigation, find little that is essential to add to Belknap's third chapter, on the Puritans of New England, or to his twenty-third, on the controversy with Great Britain in 1775.

Jeremy Belknap was born in Boston in 1744, sat under Thomas Prince in the Old South, graduated at Harvard College in 1762, was settled at Dover, N. H., from 1767 to 1786, and over the Federal Street Church in Boston from 1787 until his death in 1798. Besides his 'History of New Hampshire,' he published two volumes of 'American Biography,' and was author of 'The Foresters,' essentially an historical work, and of numerous printed sermons and pamphlets. Dr. Belknap's adult life covered the war of the Revolution, the Constitution-making period which followed, and that of the reorganization of society to meet the new order of things. People began to have new thoughts on a great variety of subjects, such as slavery, temperance, theology, and social life, and a new literary life was developed in New England. In all these matters Dr. Belknap made his influence felt, and no one earlier than he burst the bands of provincialism which bound his section of the country; and on all, something will be found in this volume. It may also be said that it is the peculiar value of these letters that they were neither partisan accounts of transactions by officials engaged in them, nor idle gossip between friends, but were mainly written by those whose aid Dr. Belknap had sought in his historical work—intelligent men who, whether communicating facts or their own opinions, wrote with a sense of their responsibility for the truth of history. And as a result, in this volume is found more authentic information on a great variety of interesting subjects concerning the period and section of the country it covers, than is often contained in volumes of correspondence.

Students of our Revolutionary history desire to learn—and get little satisfaction from general histories—just how reasonable men on both sides, Whigs and Tories, regarded each other, and what were the questions on which people once friendly, and perhaps of the same family, finally divided into bitterly hostile parties; and in the correspondence of John Wentworth, the last of the royal Governors of New Hampshire, with Dr. Belknap, will be found something to their purpose. The Governor was a dutiful servant of the Crown, but a man of good sense and right feeling. By throwing open family papers and in other ways, his assistance to Belknap was invaluable. And Dr. Belknap, on the other hand, with a just sense of his obligations to the Governor, was a stanch Whig, who always kept his colors in sight. In the impending conflict the Governor made every effort to moderate and conciliate both parties, and not without hope at one time. But in December, 1774, Sullivan and Langdon led an attack on Fort William and Mary in Portsmouth harbor and seized arms and ammunition in the custody of Crown officers, which ammunition was said to have been returned the next spring at Bunker Hill. The die was cast; and, shortly after, Wentworth writes, "that the late confusions give me great pain, indeed, not for myself, but for a people whom I love equally; such a precipitate movement upon (now) known false rumour working deplorable consequences. . . . It grieves me to my soul, thus driven from my favorite stronghold of favorable representation [to the British Ministry] by the mad intemperance of a few indiscreet individuals, who seldom want followers in folly." When the war was over, Dr. Belknap, collecting materials for that part of his History which related to it, wrote to Gov. Wentworth, then Governor of Nova Scotia:

"I do most sincerely wish that I could converse with you on some of these various topics [the Governor's administration when the war broke out], because it is my intention and desire to give as candid an account of things as is consistent with truth. It is true, I always was and shall appear in this work to be an advocate for the American side of the question which was so long in debate with Great Britain, and which is now determined by the Supreme Arbiter. But there were some things done by my countrymen which I did not approve at the time, nor has the length of time which has elapsed altered my opinion."

To this the Governor replied:

"I now declare to you in private friendship, that on a review of all my public conduct to this day I acted with honest zeal for the King's service and the real good of his subjects, which I always did and do now think were inseparable; nor did I ever know any intention to impose arbitrary laws on America, or to establish any system repugnant to British liberty, and I verily believe had the true, wise, and open measures been embraced on both sides, that this union would have been many years established and their prosperity wonderfully increased."

This correspondence puts both parties to it in an amiable light; but both probably were mistaken, and William Livingston more nearly right, when he said in 1768, "No conduct of Great Britain, whether wise or imprudent, no possible temper of hers, whether kind or cross-grained, will put a stop" to independence. It was inevitable.

Perhaps the most interesting series of letters in the volume is that of Dr. John Eliot, between 1774 and 1798. He was a son of Rev. Dr. Andrew Eliot, who remained with his people in Boston during the siege. His opportunities for knowing what was going on during that time, and observing the conduct of prominent men on both sides, were unsurpassed; and as a friend to Belknap, whose wife was his cousin, his communications to the latter in his remote home in New Hampshire were frequent

and minute, though, unhappily, not all have been preserved. In December, 1774, a few months before the war broke out at Lexington, the patriots, who relied much upon the sympathy and political aid of their friends in England, were particularly anxious in respect to the effect on the state of parties of the violent destruction of the tea in Boston Harbor the year before, and, doubtless with a sense of relief, Eliot was able to write Belknap that "Dr. Cooper, in his sermon at the lecture today, among other things, mentioned that he was well informed the minds of people were more favorable towards us on the other side of the Atlantic. It is generally supposed he has received a letter from Dr. Franklin," then in London. But clouds and darkness were about to gather around them. "Heaven protect us," he writes, "in these parts from the equally dangerous extremes of a blind submission to the lawless power of the tools of state, or the greater tyranny of factious demagogues." And a few weeks after:

"The most hostile appearance is on both sides. I dread the result of the military preparations. . . . I can't imagine what way matters can be compromised to the honor of the Crown and the security of our rights. The Congress has drawn a line which will never be submitted to while British blood flows in the veins of Englishmen. Our people will never be contented with less, though wading knee-deep in maternal blood, or deluging the land with our own, may be the consequence. . . . I have conversed with many gentlemen of the [Royal] army who seemed much averse to encounter with their fellow-subjects, but think the Congress by their late resolves have declared war against them."

Much to our regret, Eliot writes nothing about Lexington, Bunker Hill, or the siege of Boston, after which the war rolled off towards New York, and news came back slowly. "We have been left," he says, "to gain our knowledge entirely from the private letters of partisans or the more tainted medium of public prints." This is remarkable, since his letter, dated January 12, 1777, relates to Howe's landing on Long Island and the events at New York nearly six months before.

Six months before the date of this letter, independence had been declared, and one of the strongest reasons for it, as John Adams claimed, was that it would lead to the active interference of France in the war. Eliot asks: "What think you of the consequence of Independence? Last winter great bets were laid that France would openly assist the United States in less than three months after the Declaration, that they would send a large fleet and army immediately upon their hearing of it. What are our prospects?" But, after all inquiries, it came to this: "Revenge must actuate the French to hostility against Britain, and it is their interest that America should be independent," and, from two hours' conversation with John Adams on this subject, Eliot got no additional light save "that the present minister of France was a person who delighted in war."

Eliot's letters throw some new light on the treatment of the Tories, or, at least, show how in doubtful cases the line was drawn between them and the Whigs; and apparently it was by popular vote, often manipulated, as was supposed, to promote private malice or interest. The evils of paper money and its counterfeits are better known than the fact that the scarcity of food in and about Boston was alarming at times even after the departure of the army.

Next in interest, perhaps, to the political revolution which, beginning in Massachusetts, finally separated the thirteen colonies from the British Crown, was the more quiet revolution which divided the Established Church in Massachusetts, and led to the spread of dissenting opinions throughout New England, if no farther. Belknap and Eliot, like some other clergymen of good orthodox standing, sympathized with those who were known, or soon came to be known, as Unitarians and Universalists; and there are letters in this volume which indicate that their views had gained some acceptance among the laity. But even a man like Dr. Samuel Cooper, one of the boldest of the patriots, "excuses his own conduct in concealing his sentiments from the people under his charge, as well as the world in general," by what "our Saviour said to his followers; 'I have many things to tell you, but ye cannot bear them now.'" Nevertheless, old associations and old prejudices were strong, and the new men with the new views were looked upon askance. In 1775, Eliot writes, "I have seen Mr. Relly's piece, but never read it. Mr. Murray is a gentleman excelling more in brilliancy of imagination than strength of genius." Mr. Relly was a Universalist preacher in London, and Mr. Murray the founder of Universalism in America. "Mr. Murray has made a great noise in Boston, and most of the libertines of the day attend him. I heard him once. What he said was *small*, but his friends agreed in affirming this was his worst discourse." A mysterious manuscript by Dr. Chauncy was passed about some years among the younger clergy, in which, it was hinted, he treated the unpardonable sin in a way to rob it of something of its terrors; but at length, in 1784, Eliot writes: "Dr. Chauncy's MS. is in press. Not the critical remarks; only just a part, which is a mere castrated edition of the whole work. It will be anonymous." But Universalism was spreading among the younger clergy in a way that alarmed their orthodox elders. Meanwhile Dr. Hemmenway of Maine, to whom Belknap had made known some of his difficulties, wrote a most able, clear, and convincing argument, perfectly satisfactory to those who adhered to the old doctrine, but not altogether so to Belknap.

Liberalism in Church and State policy did not keep pace with liberalism in doctrine; for when the third article of the Bill of Rights in the new Constitution of 1780, making obligatory the public maintenance of worship and requiring all people to attend it, was under discussion in the Boston town-meeting, the Universalists and Baptists strenuously opposed it; but those of the Orthodox Church, and many, both clergymen and laymen of distinction, who not long after avowed Unitarianism, supported it, and Eliot's account of the debate is one of the most amusing things in the volume.

We have no space left for the letters of Dr. Rush, full of interesting matters touching almost every department of reform; or those of Paine Wingate, who kept Belknap well informed of what was going on—especially with regard to copyright law—in New York or Philadelphia under the newly formed Government, and the various conflicting interests to be adjusted by Congress; or letters of Franklin, John Adams, and others which are well worth reading. The volume has been admirably edited by Mr. Charles C. Smith of the Publishing Committee, and, with the other two volumes, together with the other writings of Dr. Belknap, forms the largest and richest body of original material extant for tracing the origin and illustrating the progress of that school of historians, of which Belknap was the first, who have added lustre to the literary renaissance in New England which marked, and, as it now seems, culminated in, the first half of the present century.

The Correspondence of William Augustus Miles on the French Revolution, 1789–1817. Edited by the Rev. Charles Popham Miles. 2 vols. Longmans, Green & Co. 1890.

It is undeniably interesting to learn that the editor of these letters can record conversations in which his father took part one hundred and twelve years ago, and that his half-sister went to school in Paris before the destruction of the Bastille; but these are perhaps the most interesting facts to be found in these volumes. The publication of the writings of a contemporary observer upon such a colossal event as the French Revolution is usually something of an event itself. The subject is too large to have been yet exhausted, and too fascinating to be ever neglected. Mr. Miles, however, was already known to students of the history of that time, and they will not suffer from the disappointment that is here prepared for the public. For, after a patient examination, we have been unable to discover in these letters any facts of importance not already known, or any judgments of men and things that have any material value. They record the activity of one of the most irrepressible meddlers that ever writ himself down an ass, and are on that account occasionally amusing; but they are in the main intolerably verbose, repetitious, inflated, and inept.

Mr. Miles was affected by the scribbling disease in its most aggravated form—that which leads to the publication of letters to prominent persons in the form of pamphlets and letters in the newspapers under such signatures as "Tiberius Gracchus," "Civis," "Amicus Justitiæ," etc. He was even more unfortunate than this. The age was propitious beyond precedent to social philosophers of the *a-priori* school, and Mr. Miles was not only convinced of his own superlative wisdom and the ineffable folly of those to whom the conduct of affairs of state was intrusted, but he actually felt an overwhelming personal responsibility for the proper direction of these affairs. Having been once employed by Pitt as an unaccredited diplomatic agent at Liége and Paris, he could never afterwards express himself otherwise than in language becoming an ambassador extraordinary and minister plenipotentiary, or, more frequently, appropriate only to the head of the Government. His diplomacy, however, was of the order which flourished most in coffee-houses and barber-shops, and he was incapable of understanding that the policy of Ministers might be determined by considerations of which he was not informed.

He conceived the idea, while stationed at Liége at the beginning of the disturbances, that it should be the policy of England to encourage revolution there and in the Austrian Netherlands, which he supposed would have prevented not only the opening of the Scheldt, but also any advance of the French in that direction. All cause of discord between England and France being thus removed, there would, as he thought, have been no war between those countries. Having been sent to Paris on a secret mission for the purpose of stirring up discontent with the family compact between France and Spain, he felt it incumbent upon himself to arrange an alliance between England and France. Not being supported by his Government in this wholly unauthorized undertaking, he devoted himself, in the unofficial career to which, in spite of his repeated endeavors, he was thenceforth condemned, to writing letters to the press, to his friends, and to Pitt himself, showing how all subsequent calamities were due to the failure to adopt his suggestions. Some of his reflec-

tions will indicate the probable merit of his plans:

"My great anxiety in the first years of the Revolution was to preserve Mr. Pitt from error." "I had communicated enough with Mr. Pitt, and with those immediately in his confidence, to convince me that he was very ill-informed in foreign politics, and very unequal to the task of conducting a war novel in all its circumstances, as well as in its origin and objects, and which had nothing in common with former contests but the carnage, misery, and devastation inseparable from all wars." "My unavailing efforts in favor of oppressed humanity, my fruitless anxiety for the freedom and felicity of mankind, and the little attention paid to my hitherto verified predictions, incline me to believe that the amelioration of the hard condition of the great mass of the people forms no part of the duty of Kings and Ministers."

Immediately after the overthrow of the French monarchy, Mr. Miles assumed the task of reëstablishing friendly relations between France and England. Imposed upon himself by some irresponsible French agents, he came near imposing upon Pitt, who in disgust pointedly requested him to abstain from further attempts at directing the foreign policy of his country. This grievance supplied him with additional material for voluminous letter-writing. The following is a specimen of his schemes and of his plaints—an epitome at once of the man and of his activity:

"My wish was to avert the calamities which have since ensued—for wars multiply and engender crimes—nor was I without hope of seeing accomplished at a future period an alliance between the two countries. It is what I have long had most seriously at heart. If the man then at the head of the Foreign Department in France, whose necessities I had relieved, and for whom I solicited in 1786 and 1787 an allowance from the Secretary of State, had been either honest or discreet—if he had even kept his word with me—I would have defied the English Cabinet, however disposed it might have been to crush the infant liberties of a rising empire, to have gratified a wish so impolitic. In the last letter I wrote to Le Brun I traced so explicitly the route he had to follow, that if his vanity and irregular ambition, mixed perhaps with some degree of personal resentment at the disappointment he received in 1787, had not blinded him to his true interests, as well as to all sense of duty to his country, the war would certainly have been avoided. I was well known in Paris and in other parts of the Continent, where despotism, falling under the pressure of its own weight, had annihilated itself. It was understood that my mind, independent in all its operations, disdained the shackles of party, and that, influenced by a love of liberty and of justice and uncontaminated by considerations of personal interest or ambition, I always judged for myself from facts and the best evidence I could obtain. It was with this stock of reputation in advance, and conscious of being right, that I conceived the project of preserving peace between the two nations. . . . If my suggestions had been attended to by those who swayed the councils in both countries, the ruinous contest in which they are engaged, and the sad consequences of which I predicted at the time, would not have happened."

One more effort was made by Mr. Miles to restore our distracted planet to its orbit. A French officer, La Colombe, of royalist proclivities, approached him with the suggestion that if England would declare that she would be satisfied with a limited monarchy in France and would procure the release of Lafayette and his companions, they would at once proceed to Auvergne and raise an army there of 25,000 or 30,000 men with which to oppose the Convention. For the production of this army La Colombe offered the security of his head. Mr. Miles at once hastened to the Foreign Office with this proposal, with the mortifying result of finding it entirely ignored. Probably Pitt "liked not the security." From this blow Mr. Miles never recovered, and he spent the rest of his days in expatiating to every one who would listen to him—and to some who would not, for after repeated snubs he persisted in writing to Pitt—upon the disastrous consequences of the neglect of his advice. Yet though cast down he was not crushed, if the *mens sibi conscia recti* has any sustaining power.

"Thrown upon the world to explore my way through its dark, intricate, and dangerous mazes, my own master before I had attained the age of eleven, I have escaped the contagion of the bad example with which I was surrounded; and with passions as violent, and with a mind as ardent and volatile as ever swayed the human breast, I have not allowed myself, in my intercourse with men, to be seduced or intimidated from the love and practice of right. It is this inflexible attachment to right that consigns me to my voluntary exile."

This "voluntary exile" was his retirement to the country in a fit of the sulks over the rebuffs which his meddling brought him. We see no reason to believe that his country suffered from his exile. It is possible that the letters from Paris, written to Pitt by Mr. Miles in 1790–'91, which are lost, may have been more interesting than those which have been preserved; but a perusal of the latter does much to console us for our loss. It is just to add that Mr. Miles's efforts at *la haute diplomatie* seem to have been pecuniarily disinterested, and that he declined employment by Government as a paid writer for the press. Mr. Miles certainly had opportunities. He was a member of the Jacobins, and he predicted the rise of Robespierre. He corresponded with men in high position and acquainted with the secret springs of events. But his overweening conceit made his abilities unavailable. He is a most impressive illustration of the wisdom of the advice to a youthful diplomat—*Surtout, pas trop de zèle.*

Capt. Francis Champernowne, the Dutch Conquest of Acadie, and Other Historical Papers. By Charles Wesley Tuttle, Ph.D. Edited by Albert Harrison Hoyt, A.M., with historical notes. With a Memoir of the Author by John Ward Dean, A.M. Boston. 8vo, pp. 426.

THIS handsome volume is the tribute of affectionate friends to one of the most diligent and careful of our antiquarian writers. Charles W. Tuttle, of noted New Hampshire origin, was a student all his life, and fortunately his tastes led him to give much time and care to investigating the more obscure portions of our local history. He displayed in his youth a great aptitude for the study of astronomy and mathematics, and was for several years connected with the Observatory at Cambridge, where he proved to be "an eminently capable assistant." At the age of twenty-five he was obliged to relinquish this study, and proceeded to qualify himself for the bar, being admitted to practice in 1856. From this time onward he relieved the hard work of his profession by earnest and successful researches in the field of genealogy and history. He contributed many articles to the *Historical and Genealogical Register* and the Proceedings of the Massachusetts Historical Society. In the present volume are reprinted his essays on "Capt. Francis Champernowne," "Conquest of Acadie by the Dutch," "Indian Massacre at Fox Point," "Provincial Government of New Hampshire," "Hope-Hood," "Christopher Kilby," "Hugh Percy," "Court of Vice-Admiralty over America," "Edward Randolph," "Cutt and Elliot Families," and numerous shorter papers.

It is impossible to speak too highly of the merit of these essays. Not only are they evidence of the author's complete mastery of each subject, but they abound and overflow with those details which show that he held in reserve much that a less severe judgment would have hastened to display. The text is ample and well-considered, but at every page the footnotes tempt the reader to stray into fascinating details which display the industry of the antiquary and the discretion of the collector. The biographical essays—Champernowne, Randolph, and Kilby—are especially to be cited as models for imitation by future writers. We shall not attempt to make citations from these essays, for they deserve to be read in their completeness, and they will remain as standard authorities on these topics, with hardly a possibility of future alteration or addition.

Mr. Tuttle died in 1881 at the age of fifty-one years, after a life of happy usefulness such as is granted to very few. He was fortunate in his family, his friends, and in that appreciation and fellowship of which he was naturally sensible. Of a generous and amiable nature, he made and retained friends, while he was singularly free from the disputatious and aggressive side of the literary character which antiquaries proverbially possess. He was always ready to impart information, however laboriously acquired, without the despicable desire of retaining it for his own literary renown. His wife was a fitting helpmeet, and, surviving him some six years, she made provision for the publication of this book as the best tribute to his memory. The pious task has been well performed by Col. Hoyt and Mr. John Ward Dean, both distinguished workers in the same branch of literature, and eminently fitted also by a long and intimate acquaintance with the author.

Although Mr. Tuttle's work was of less ambitious proportions than that of Palfrey or Prescott or Parkman, it was of equally good material and finish. He stands very high among a class of writers like Winthrop, Deane, Ellis, and others of lesser note, who have found time, amid the pursuits of active business, to make careful and intelligent research into sections of our history. By not attempting too much they have attained a completeness otherwise unattainable, and the aggregate of their labors is beyond the powers of the most gifted single historian. It is to be hoped that this earnest love of the past will not die out with the present generation, and that the young men of wealth and education, now coming forward in less admirable competitions, will yet see that such pursuits as this are peculiarly their most honorable and desirable opportunity.

Rambles in the Black Forest. By Henry W. Wolff. Longmans. 1890.

ANY ONE who on a summer's day has to wait for an hour or so at the railway station at Appenweier, opposite Strassburg, is apt to fancy himself at some large watering-place. Here he sees, promenading up and down the spacious covered platform, or lounging on the seats, countless Germans, but more Englishmen and Americans. Away to the west is the dim outline of the Vogesen, and if he look sharp, he can easily make out the spire of the cathedral at Strassburg. But if he turn to the east, he will see spread out right before him the whole beautiful panorama of the Black Forest. It is this that has attracted so many tourists, he thinks to himself, and he fancies that the next train up the valley of the Reuch will be boarded by most of those about him; but he is mistaken. A very few do go up the Reuch,

see the beautiful falls at Allerheiligen and climb up to the enchanted Mummelsee. But the great majority turn a cold shoulder on the Black Forest and make haste to reach the Alps and Italy. Every one must see the Alps, and no fault can be found with that. But to one who has been awed by the cold grandeur of those colossal peaks, nothing can be more satisfactory than to be once more among the pine-clad hills of the Black Forest. Here he feels at home and not like a stranger in a land of giants; all that is about him seems to have human sympathies, and he would hardly feel surprised to see a wood-sprite pop out from behind a tree and offer to do him a kindness.

It is surely a charming country, with its dark-green forests, bright meadows, picturesque cottages, and, above all, its dashing mountain streams. Who could ever forget the refreshing drink a Black Forest spring had given him? Mr. Wolff is thoroughly at home in the Black Forest, and knows all its charms, but it is not only its natural beauties that he tells us of. He has been there often enough and lived there long enough to get perfectly familiar with the people, their homes, their dress, their every-day life, and their very habits of thought. He takes us into their houses and he tells us all about them; for he has not regarded this peculiar people with the eyes of a tourist, but they have learned to let him see what they would keep from such a one, and he has observed them in all seasons and under all circumstances. He has also made a careful study of their social and industrial condition—an entirely different study from that made by the hasty traveller, who takes a glance and asks a question or two and then writes a column. He has investigated the local records, the history, and the archæology of town and valley, and gives us the results of his study in a charmingly modest way. Mr. Wolff speaks the language of the Englishman, but his head and his heart are German, as his ancestry doubtless is. It is safe to say that the more his book is read the more people will go to the Black Forest, and they can have no better guide.

BOOKS OF THE WEEK.

Westcott, B. F. Essays in the History of Religious Thought in the West. Macmillan & Co. $1.75.

APRIL

EDUCATIONAL REVIEW.

Edited by NICHOLAS MURRAY BUTLER, Ph.D., assisted by E. H. COOK, Ph.D., WILLIAM H. MAXWELL, Ph.D., and ADDISON B. POLAND, Ph.D.

Articles: Art Education in the Public Schools, James MacAlister—The Pedagogic Value of Zoölogy, S. A. Forbes—Recollections of Round Hill School, George E. Ellis—Adolf Diesterweg, Henry Cassel—James' Principles of Psychology, J. Mark Baldwin.

Discussions: State Councils of Education, Addison B. Poland—The Legal Definition of a School, C. W. Bardeen—The Movement for an Einheitsschule in Germany, L. R. Klemm—The Department of Superintendence, William H. Maxwell—The Brooklyn Institute Geographical Exhibit, James Cruikshank.

Editorial: The Reorganization of Higher Education in America—The Fayerweather Bequests to Colleges—The University Extension Movement—Public Libraries and Reading-Rooms in Schoolhouses.

Reviews: Spalding's Education and the Higher Life—Steele's Rudimentary Psychology—Gordy's Lessons in Psychology—Belton's Literary Manual of Foreign Quotations—Hodgkins' Arnold's Sohrab and Rustum—Bird's Elementary Geology—Flower's Quintus Curtius—Monteith's School and Family Atlas—Eisenhans' Psychologie und Logik—Rosetti's Shelley's Adonais—Frye's Brooks and Brook Basins—Notes on Recent Pedagogical Literature.

Foreign Correspondence: Contemporary Educational Thought in Great Britain.....J. G. Fitch

35c. a Copy, $3.00 a Year (10 Nos.).

HENRY HOLT & CO., New York

TO EUROPE. THREE VACATION EXCURSIONS will sail from New York by Cunard Steamer "*Gallia*," June 24th, Cunard Steamer "*Servia*," July 4th, Inman Steamer "*City of New York*," July 8th, to visit Liverpool, Chester, Warwick Castle, Shakespeare's Home, Kenilworth, Oxford (the great University town), LONDON (six days, with three days' carriage drives), PARIS (six days, with three days' carriage drives), Brussels, Antwerp, Edinburgh, Melrose, Abbotsford (the home of Sir Walter Scott), the celebrated Trossachs, Belfast and Giant's Causeway, Dublin, Killarney (with its world-renowned lakes), Cork, etc., etc., with extension to Italy, Germany, The Rhine, Switzerland, Belgium, Holland, etc. Prices, including all necessary expenses: Section 1, $180; Section 2, $300; Section 3, $375. Send for complete itinerary of these and other tours to *Dept. Educational Tours*, THOS. COOK & SON, 261-262 Broadway, New York.

MEMORIAL TABLETS.

These tablets are executed in Polished Brass, Modelled Bronze, Carved Wood, etc., to be placed on the walls of Colleges, Libraries, Public Buildings, etc., to serve as an historical record.

Following are a few of the colleges in which we have placed tablets:

Princeton College,
Johns Hopkins University,
Lehigh University,
Trinity College,
Amherst College,
Racine College,
The U. S. Naval Academy,
Seton Hall College,
University of the City of New York,
National Deaf Mute College, Washington, D. C.,
Drew Theological Seminary,
Lehigh University,
Wells College,
Union Theological Seminary, N. Y.,
Rutgers College,
Washington and Lee University.

Special designs will be formulated to embody any particular ideas desired.

Illustrated hand-book free.

J. & R. LAMB,

Dyspepsia

HORSFORD'S ACID PHOSPHATE.

In dyspepsia the stomach fails to assimilate the food. The Acid Phosphate assists the weakened stomach, making the process of digestion natural and easy.

Dr. R. S. McComb, Philadelphia, says: "Used it in nervous dyspepsia, with success."

Dr. W. S. Leonard, Hinsdale, N. H., says: "The best remedy for dyspepsia that has ever come under my notice."

Dr. T. H. Andrews, Jefferson Medical College, Philadelphia, says: "A wonderful remedy, which gave me most gratifying results in the worst forms of dyspepsia."

"Full of power."—*Literary World.*

A NEW CHEAP EDITION.

LIFE AND LETTERS OF JOHN BROWN.

By F. B. SANBORN. With Portraits, an Engraving of Brown's birthplace, and facsimiles of important documents. 12mo, cloth, $2.00.

AT ALL THE BOOKSTORES.

ROBERTS BROTHERS, PUBLISHERS, BOSTON.

A New Edition de Luxe.

Bulwer-Lytton's Novels.

LIMITED TO 1,000 COPIES.

The first and only fine illustrated edition of Lord Bulwer-Lytton's Novels ever made in Europe or America.

Bulwer stands foremost among novelists as a student and delineator of human nature, instincts, and passions, and he is also acknowledged to be the most versatile writer of his day and generation.

His popularity is increasing every year, and the publishers recognize the great demand for a good edition of his writings. This edition is embellished with over 200 Photogravures on Japanese Government paper, from original drawings and paintings by the best illustrators in America, and photographs of the actual scenes and places referred to, gathered on the spot especially for this edition.

The manufacture of the book is perfect.

The type is large and new, and set in a fine open page. The margins are ample, and the paper a beautiful natural-tint laid paper. The volume is a small 8vo, easy to handle, and the binding is vellum cloth, gilt tops, slightly trimmed. Complete in 32 volumes, *issued at the rate of about 2 volumes per month, at* $2.50 per volume. *Prospectus and specimen pages showing type, page, and paper, with sample illustration, sent on application.*

PUBLISH THIS WEEK:

The Memoirs of Talleyrand.

Edited, with preface and copious explanatory notes, by the DUC DE BROGLIE. Translated by Raphaël Ledos de Beaufort. With introduction by the Hon. Whitelaw Reid. To be complete in five volumes. VOLUMES I. AND II. NOW READY.

Octavo, with portraits and facsimiles of manuscript. Each, $2.50.

Contents: Volume I.—Part I. The Years Preceding the Revolution, 1754–1791—Part II. The Duc d'Orleans—Part III. The Convention; The Directory; The Consulate; The Early Years of the Empire, 1791–1808—Part IV. Spanish Affairs, 1807—Part V. The Erfurt Interview, 1808.

Volume II.—Part VI. Napoleon's Marriage; His Brothers; His Struggle with Pius VII., 1809–1813—Part VII. The Fall of the Empire; The Restoration, 1813–1814—Part VIII. Congress of Vienna, 1814–1815.

"They are the most valuable contribution made in our time to the history of new France and the new Europe which had their birth in the Revolution."—*N. Y. World.*

"The Memoirs of Talleyrand are both interesting and valuable. . . . The chief charm of the first portion of the Memoirs lies in the acute and quite elaborate analysis by Talleyrand of those elements in French society previous to the Revolution which, in his opinion, made the Revolution possible. It is impressive, brilliant, and once read not easily forgotten. . . . The accuracy and fidelity of this copy of the Memoirs have been disputed. But we see no good reason for doubting them. They are vouched for in the most formal manner by the present editor and by M. de Bacourt, the immediate custodian of the manuscripts, named by Talleyrand himself."—*N. Y. Times.*

The concluding volumes will follow at brief intervals.

(Full descriptive Prospectus sent on application.)

LEADERS IN SCIENCE.

I. The Life and Work of Charles DARWIN. By CHARLES F. HOLDER, author of 'Living Lights,' 'The Ivory King,' etc., etc. 12mo, illustrated, cloth, $1.50.

T. W. RUSSELL, President. F. V. HUDSON, Secretary.

The Nation.

NEW YORK, THURSDAY, APRIL 16, 1891.

The Week.

THE President has issued the usual annual proclamation warning all persons not to enter "the dominion of the United States in the waters of Bering Sea" for the purpose of violating the provisions of section 1956 of the Revised Statutes. The issuance of such a proclamation "at a timely season in each year" is required by the act of March 2, 1889, "to provide for the protection of the *salmon* fisheries of Alaska." The history of this act is rather curious. It was introduced February 25, 1889, by Senator Stockbridge of Michigan, who said that it was urgently recommended by the Fish Commission. It was referred to the Committee on Fisheries, and reported favorably on the 28th of the same month and passed without calling the yeas and nays. It contained only two brief sections, one prohibiting the erection of dams in the rivers of Alaska which should prevent the salmon from reaching their spawning grounds, the other providing that the Fish Commissioner should institute an investigation into the habits of the salmon of Alaska and make a report recommending to Congress such additional legislation as should be needful to preserve the salmon fishery there. The bill reached the House the same day, February 28, and was immediately put on its passage. Mr. Dunn of Arkansas offered an additional section as an amendment, declaring "that section 1956 of the Revised Statutes of the United States was intended to include and apply to all, and is hereby declared to include and apply to all, the waters of Bering Sea in Alaska embraced within the boundary lines mentioned and described in the treaty with Russia dated March 30, 1867." Section 1956 Revised Statutes is the one which forbids the killing of any fur seal "in the territory of Alaska or the waters thereof." The effect of Mr. Dunn's amendment was to give a legislative interpretation to the phrase "the waters thereof," so as to make those waters include the whole of Bering Sea east of the boundary mentioned in the treaty. It was adopted by the House without a division, and the bill was passed without even an amendment of the title, which spoke only of salmon fisheries.

The bill came back to the Senate the same day and the amendment was read. Senator Edmunds remarked that the amendment raised a very important and difficult question. He did not know whether it was intended to apply to American citizens only or to foreigners as well. If it applied to Americans only, it was a very curious discrimination. He moved that it be referred to the Committee on Foreign Relations. Senator Hoar said: "The amendment raises the great question whether the United States propose to assert the doctrine of *mare clausum* in regard to a sea larger than the Mediterranean, and the gateway to which is 450 miles wide." The bill was referred to the Committee on Foreign Relations, and was reported back the next day by Senator Sherman, with the recommendation that the Senate disagree to the amendment of the House. Mr. Sherman said that the amendment involved a grave principle of international law which the Committee had had no time to consider carefully, that it was not germane to the bill, and that it ought to be abandoned and considered more carefully hereafter. The Senate disagreed to the amendment and asked a committee of conference, and appointed Senators Sherman, Edmunds, and Morgan as its conferees. The House agreed to the conference, and a report was made on the following day (March 2) striking out the House amendment, and substituting for it a declaration that section 1956 includes "all the dominion of the United States in the waters of Bering Sea." The House conferees submitted a statement in writing that "the effect of the amendment is to leave out of the House amendment *the words that are descriptive of the boundaries of the waters of Alaska.*" This supplies presumptive evidence that no President and no Cabinet officer has ever issued an order directing our revenue cutters to seize vessels, either American or foreign, engaged in taking seals more than a marine league from the shore, and leaves us to infer that such orders, if any exist, were issued by subordinate officials at the instance of the Alaska Commercial Company.

The welcome announcement comes from Washington that, just before starting on his vacation, the President gave directions that a portion of the Indian service be placed under civil-service rules. It is explained that the new order will apply to superintendents of schools, teachers, matrons, physicians, and farmers—about twelve hundred employees in all. The system can be extended to cover these by executive order, whereas it cannot be applied to the Indian agents without authority from Congress. There is no part of the civil service where the reform system is more imperatively demanded than in the Indian Bureau, and the extension just ordered by the President is cause for rejoicing on the part of all good citizens.

Senator Morrill of Vermont is evidently opposed to the nomination of Blaine and in favor of the renomination of Harrison by the Republicans next year. In an interview published by the *Times* he said that "Harrison was almost the only one prominently talked of by the Republicans now." Also, that he believed that Mr. Blaine was loyal to Harrison, and that Mr. Blaine did not seem to be in perfect health, although his mental faculties were as keen and vigorous as ever. Mr. Morrill further declared himself opposed to reciprocity with Canada. Putting all these facts and fancies together, it would appear to a worldly-minded person that the dividing line in the Republican party is the McKinley tariff; that Mr. Harrison supports that measure and means to be a candidate for reëlection on that issue; that Mr. Blaine is opposed to the McKinley tariff, and means to whittle it down by reciprocity treaties as much as he can. Whether Mr. Blaine is loyal to Harrison or not is a matter of indifference to those who shout for Blaine, as the Boston Republican Club did the other day. These men are moved in part by personal attachment, and in part by the belief that McKinleyism will be fatal to Republican success in 1892. They look upon Blaine as the only man who can undo the mischief of last year, whereby a small but safe Republican majority in the House of Representatives was converted into a Democratic majority of 150 members. By nominating Blaine they can hold out the bait of a repeal or modification of the McKinley Bill without actually promising anything in that particular. We apprehend that Blaine's loyalty to Harrison will not operate as an embarrassment to any Republican who is much attached to the former, or to any who was terrified by the returns of the election last November.

The tone of the speeches at the first banquet of the newly organized Republican Club in Boston last week indicated a conviction, in the minds of some of the speakers at least, that the time has arrived when the party must "pander a little to the moral sense of the community," if it is to expect a future. The President of the Club, Mr. Wolcott, struck a keynote in his opening speech, which was not only full of charity for Mugwumps, but also full of very unorthodox views of eminent Republican leaders. "No word of mine," he said, "shall ever be uttered to depreciate that virile independence in politics which holds country and honor above party, which, while acting within party lines, ever strives to secure the best in men and measures, and, often buffeted and defeated, never ceases to wage war upon dishonesty and chicanery, using party as a weapon, but never wearing it as a yoke." As if to illustrate what he meant by acting within party lines and "waging war upon dishonesty and chicanery," Mr. Wolcott went on to denounce the "menace to the cause of free government embodied in 'blocks of five,'" and to say of the Chairman of the National Republican Committee—

"The Republican party must make its appeal, as of old, to the intelligence and patriotism of the country. It must rally to its standard the recruit and drum out the mercenary. The loss of thousands of votes in this State was due to the Pennsylvanian who is still Chairman of the National Committee. The kind of personal politics that seeks and requires what is called 'vindication' is always

at the expense of party, and is a blunder when it is not a crime. The standard of political rectitude must be made more exacting, and it must be remembered that the nation, and not the self-imposed candidate, has the only 'claim' upon every office in its gift."

Secretary Tracy, who was the chief guest of the evening, followed the President of the Club, and devoted his speech mainly to an exposition of the need of putting the navy-yards of the country within the jurisdiction of civil-service rules. "For fifty years," he said, "the employment of labor at the navy-yards has been the one weak spot in navy administration," adding:

"Whatever the party in control of the Government, it seems hitherto to have been powerless to exclude political influence in the employment of navy-yard labor. It is not enough, apparently, that the mechanics and workmen in the Government shops should be Republicans or Democrats—they must wear the collar of the ward bosses who run the local political machine. The practice is a source of demoralization to any party that attempts to use it, destructive to the Government services, and debauching to local and national politics. It is an ulcer on the naval administrative system, and I propose to cut it out."

Nobody who has followed the Secretary's extraordinary course in regard to the employment of labor in the Brooklyn Navy-yard, will deny that it has constituted an "ulcer" which has "debauched both local and national politics" in Kings County, as thoroughly as similar conduct by his predecessors in office debauched the same politics for fifty years. If he has decided that reform is necessary, a distinguished convert to the cause of civil-service reform has been gained. He will have to keep an eye on the President, however, for there is no telling when the latter may become convinced that the bad deeds of the Democratic party in the South and in Congress make it his duty to set civil-service-reform rules and pledges aside, as he did in both the Boston Custom-house and the Boston Post-office.

There is, we dare say, something in the theory that the impatience shown by many of the younger Republican Senators from the West at what they stigmatize as the "dictation" of the "old fogies" from the East, had its share of influence in hastening Mr. Edmunds's withdrawal from public life. There is no doubt of the existence of a strong and growing sectional feeling of this sort throughout the West, without regard to party lines. It finds expression in the increasing frequency of the remark that there is really not half so much in common between the West and the East as there is between the West and the South, and that an alliance between the two latter sections would be of far greater advantage to the West than further submission to what is denounced as the "tyranny of the East." The younger Republican Senators from the West are so full of this idea that they hardly conceal their intention to make trouble for the Eastern "fossils," as they call them.

It should not be forgotten that the nation owes Senator Edmunds hearty thanks for much-needed assistance in defeating the Force Bill. When the proposition to change the Senate rules and introduce the Reed régime was brought forward by the advocates of the Force Bill during the first session of the Fifty-first Congress, the Vermont Senator took a firm stand against it, and thus was largely responsible for carrying the matter over to the short session. Towards the close of the controversy in the second session, Mr. Edmunds's partisanship was so much aroused that he was understood to have changed his position on the question of the rules, and to be ready to consent to the introduction of the previous question. Happily, it was then too late to be of any avail. It is a serious blunder on the part of the Burlington (Vt.) *Free Press* to cite, as an evidence of Mr. Edmunds's statesmanship, the fact that "he reported and had charge of and carried through the great civil and political rights act which now forms the principal body of the law on that subject," and to add that "the importance of his services in regard to this measure cannot be exaggerated." That Mr. Edmunds reported and carried through the act in question is true, but it ceased to be "the principal body of the law on that subject" from the day when the Supreme Court, consisting entirely of judges appointed by Republican Presidents, said of it: "On the whole, we are of opinion that no countenance of authority for the passage of the law in question can be found in either the Thirteenth or Fourteenth Amendment to the Constitution; and no other ground of authority for its passage being suggested, it must necessarily be declared void." A more severe rebuke of a Senator could hardly be imagined than was thus administered to Mr. Edmunds by the highest judicial tribunal in the land, all the members of which then held commissions signed by Presidents of the party to which he belonged. Mr. Edmunds has rendered the nation great services, notably in carrying through the Electoral Commission scheme of 1877; but he is a very injudicious friend who revives the memory of his connection with the Civil-Rights Act.

The judicial election in Michigan last week resulted in a majority for the Republicans of not far from 7,000. Some of the party organs have treated the result as a great victory for the Republicans on national issues. The Philadelphia *Press* is more sensible when it says: "There is no State in the Union in which the people are better able to judge of the merits of parties and policies than are the voters of Michigan. They defeated the Republican party last fall because it presented an unworthy candidate for Governor, and they defeated the Democratic party last Monday because it has used its temporary power in the Legislature to perpetrate some of the most despicable tricks ever perpetrated by a political organization." So far as national issues are concerned, the fact that the Republican majority was no larger last week when the Democrats so richly deserved an overwhelming defeat on State issues, would indicate that in a fair fight between the two parties Michigan would be doubtful.

A bill to distribute the direct-tax money refunded by the Federal Government to the State of New York has been introduced into the Assembly and referred to the Committee of Ways and Means. It provides that said moneys shall be apportioned among the several counties of the State by the Comptroller, and paid to the County Treasurers of the several counties of the State and to the Chamberlain of the city and county of New York in proportion to the total equalized valuation of property for purposes of taxation of said several counties for the year 1861, upon which the State tax of 1862 was levied. We trust that no such bill, or any other county refunding bill, will pass. If the money is left in the State Treasury and applied to that portion of the State debt which is yet unprovided for ($1,677,887), and the balance used for other State purposes, it will apportion itself among the counties satisfactorily. It may not go in the exact ratio that the apportionment of 1861 would provide, but it will answer all the ends of justice, and spare a deal of squabbling among the county supervisors, who will be asked to apportion it among the towns.

A bill has been introduced in the Minnesota Legislature prohibiting any foreign insurance company—that is, any company whose home office is outside the United States, or the majority of whose stock is owned or controlled by parties not citizens of the United States—from doing business in the State until it has deposited with the State Treasurer not less than $200,000 invested in Minnesota securities. The pretended reason for this is, that the deposit shall be held for the benefit of the policy-holders, although the policy-holders are already amply secured against any possible failure of these foreign companies by the provisions of the Federal law which require each of them to deposit with the Treasurer of the State wherein is its principal office in the United States, securities amounting to $200,000 and trust funds in the hands of trustees to the amount of $300,000 more—or half-a-million dollars in all. If, in addition to this, each State in the Union is going to demand an additional deposit of $200,000 more, this would be equivalent to a requirement that each foreign company make an aggregate deposit in the different State Treasuries of about $9,000,000 for the privilege of doing business. The St. Paul *Pioneer Press* exposes the absurdity and injustice of this scheme in an elaborate article which is introduced by this feeling remark: "We have had a good many mischief-making Legislatures before the one now in session, but none half so fertile and ingenious as this in concocting measures which are deliberately designed to inflict every possible injury upon every possible business interest." Unfortunately for the rest of the States in the Union, Minnesota is not much worse off in this respect than they are.

The new ballot law which the New Hampshire Legislature has enacted, and for which the Governor's approval is assured, is, in all essential respects, similar to the Massachusetts law. It does not, like the Maine law, provide for the arrangement of candidates' names by party groups upon the ballots, but in alphabetical order under each office, with the politics indicated after each name. In case a candidate is nominated by means of petitions or nomination papers, the words "nom. paper" must be added after the political appellation. This will assist the voter in deciding whether a candidate is "regular" or not. A new feature, in laws of this kind, is a provision requiring the use of ballot-boxes "with a bell and mechanical device for receiving, registering, and cancelling every ballot deposited therein," but specifying that "no such box shall record any number or mark upon any ballot by which said ballots can be distinguished from each other." There is no obvious reason for the adoption of boxes of this kind, except that the owners of some patented device succeeded in inducing the Legislature to make use of it. Every New England State has a ballot-reform law now, and all of them, except Connecticut, have thoroughgoing ones. The number of States throughout the country with such laws now stands at twenty-three, with the prospect of Illinois and Ohio soon swelling it to twenty-five.

The renewal of gold exports of considerable amount ought to direct public attention again to the law which requires the Government to buy 4,500,000 ounces of silver per month. This product of American industry is peculiarly well fitted for export. The demand for it is as steady as ever, but the Government steps in just as it reaches the seaboard and takes the whole, or nearly the whole, output of the mines, pays gold for it, and then locks it up. Then the exporters, who were about to send the silver abroad to pay our debts with, send the gold instead. That is the explanation of the present exportation of gold. We may expect this draft on our gold to continue until prices of other exportable commodities are lowered so that foreigners will take our goods rather than our money.

The newly discovered counterfeit two-dollar silver certificate shatters the belief expressed three years ago by the House Committee on Treasury expenditures, in their report opposing the use of steam-presses in the Bureau of Engraving and Printing. They contended that, while these presses might reduce the cost of printing, yet this economy would be counterbalanced by "the increased expense of maintaining the secret division of the Treasury Department, which must be incurred so long as the obligations and securities of the Government can be readily and successfully imitated—an expenditure that can be reduced as soon as the Government shall be able to print its securities or obligations in so perfect a manner as to make it impossible to counterfeit them; and when this degree of excellence in printing our notes and securities shall be reached, there will be the further saving of the expense attending the prosecution of captured counterfeiters." Nearly two years have passed since the steam-presses were thrown out to give room to the hand-presses which would enable the Government "to print its securities or obligations in so perfect a manner as to make it impossible to counterfeit them." Yet we have heard of no movement to abolish the Secret-Service Bureau, or even to reduce its force and expenditures. The fact is, that even if there were no counterfeiters of our gold and silver coins, the secret service could not with safety to our currency be abolished or crippled. So long as there are Government obligations and securities to be counterfeited, there will be persons to attempt to imitate them; and it will make no difference whether they are printed on hand-presses or steam-presses, if they be printed well.

It was not the imperfect printing that disclosed the character of the counterfeit; it was imperfect engraving—the mistake in the check-letter and the signature. The art of printing securities presents no serious difficulties to the counterfeiter; even the distinctive paper, thought by so many to be an important safeguard, he has imitated with almost perfect success. It is the engraving that taxes his skill, ingenuity, and capital. He finds it exceedingly difficult, if not impossible, to engrave a plate that will be the equal in every part of one turned out by the Bureau of Engraving and Printing. He cannot engrave with equal excellence the portrait, the border, the signature, the lettering, and other features of a note, each of which is always intrusted to one man skilled in doing that particular thing. He does not possess the lathes and other machinery of the Bureau, nor is he familiar with its system of check-marks and numbers that add to the security of the work. To say, therefore, that the excellence of our notes and certificates depends entirely on the machine printing them is absurd.

Mr. Platt's home organ, the Owego *Times*, asks: "Why is it that the Democratic press is generally silent regarding the fact that, under the McKinley Tariff Law, sugar, is at present two cents cheaper than before this bill became law?" The impression we have gained from a pretty large exchange-list is, that the Democratic press is by no means generally silent on the subject, but, on the contrary, indulges in uproarious mirth over this clearest of demonstrations that the tariff is a tax, and the accompanying consternation among the better-informed Republicans. Off comes the tariff, down goes the cost; this is the lesson that the sugar provision of the McKinley tariff teaches in every household of the land. McKinley platform speakers have taught that the tariff is no tax; that it is a tax, but one that is paid by the foreign exporter, etc., etc. Along comes the McKinley change in the sugar rates and shows that the tariff was all tax and all paid by our own citizens, and that the price goes down just so soon and just so much as the tariff is reduced. It would, indeed, be very singular if, in regard to this clear argument that touches every pocket, the Democratic press were to be generally silent.

The last number of the trade newspaper *Hardware* has a continuation of the history of the Axe Trust, the beginning of which was published in the same journal last year. The American Axe and Tool Company, which undertook to monopolize the business, did not succeed in getting all the factories consolidated, but it made an arrangement with the outside concerns by which uniformity of prices should be maintained. Then it made a heavy advance in the price of axes, and went on swimmingly until a lot of old factories that had been closed in the previous struggle of the "survival of the fittest" were encouraged to reopen. This led to negotiations to bring in the outsiders, who were nothing loath. While the negotiation was in progress, the Trust sent out its agents to make secret contracts with the trade, offering a heavy rebate on the former agreed price if the jobbers would agree to buy exclusively from the Trust. But the jobbers were too smart. They refused to make such contracts, and then the double-dealing of the Trust became manifest, to the amazement of the outside manufacturers. An old-fashioned fight ensued and is still going on, to the joy of the jobbers and the consumers, who are now paying for axes what they can be produced for by the most skilful and best-equipped concerns.

That was a bad case of "journalism" that broke out in Rome last Friday, when the American newspapers were advised that if the United States Government did not answer the Marquis Imperiali's note by Saturday, the American Minister to Italy would be ordered to bundle himself out of the country. This news was preceded by the usual "it is reported," and the reporter has ever since been searching for the source of the report, but thus far without success. On Saturday he said that the rumor that had been "put in circulation" was the principal topic of conversation in political and official circles, because the report had come "with startling suddenness." A lurking disposition was manifested to let it go, however, in the remark that "it is not summarily dismissed as incredible." Its origin was ascribed to "a prominent member of the Chamber of Deputies," but his name was prudently withheld. A reassuring paragraph was added, to the effect that no American need fear to travel in Italy. Further assurance was conveyed the following day by a paragraph from the *Opinione* of Rome, that if the American Government could afford to wait, Italy could do so "serenely, and without lamentation or threats." This was a flat contradiction of "the report," but the unknown author of it is not yet willing to part with it, as appears by the latest despatches.

THE PROPER SIEVE FOR IMMIGRANTS.

THE New Orleans massacre of Italians has made more prominent than ever the question of restriction on immigration, and the act of Congress for the exclusion of persons of bad character and infirm or diseased persons is being enforced more rigidly than before. The Union League Club of this city, at a meeting on Thursday evening, called on the general Government for more stringent legislation to prevent the influx of criminals and paupers and to restrict naturalization. One finds expressions of opinion of the same sort in speeches and articles all over the country. There is no doubt that the belief that the tide of immigration generally, whether the people composing it are criminals or paupers or not, ought to be arrested or diminished in some manner, is steadily gaining ground; but we nowhere find any adequate discussion of the means by which the desired end is to be accomplished.

The nature of the problem has been extremely well described in a book on 'Emigration and Immigration,' published last year by Prof. Richmond Smith of Columbia College. We cannot hope at present for a fuller account than he supplies of the history of emigration to the United States, and of its moral, social, economical, and political effects. He is evidently of opinion that we have reached a point of economical development when we can supply our own wants, so far as unskilled labor is concerned, with the aid of machinery, and maintains the desirableness of some degree of exclusion, on the general ground that every nation is bound to see that its own civilization does not suffer from an attempt to absorb foreigners in a lower stage of civilization. But neither he nor any one else who has treated the subject deals with the *modus in quo*. What we want to hear now from some quarter is an answer to the question, By what process shall we sift the desirable from the undesirable immigrants either here or abroad?

The lunatics, paupers, and cripples are easily weeded out. All we have to do as regards them is to send enough doctors on board when the ships come into port. Even if they slip through, their presence here is merely a question of the expense of taking care of them. But how about the question of character, which concerns the workings of our institutions? To get at the character of one hundred natives living in the next street is, as every one knows, no easy matter. But by what sort of visitation or scrutiny would it be possible to get reliable information about the morality and antecedents of the 200,000 ignorant and obscure Italians, or of the 100,000 Germans, or the 40,000 Austro-Hungarians, who came to us in 1889?

Prof. Smith mentions the late Mr. Eugene Schuyler's plan of requiring a consular certificate of good character and self-maintaining capacity from each emigrant, but he sees the obvious objection to it that it would give the consuls far more work than they could do, and would make them dependent on the local police for nearly all their information. He might have added that no consuls are less fitted for such task than American consuls, under our present system of appointment. They rarely know the language of the country in which they are stationed, and rarely keep their places long enough to acquire any intimate acquaintance with the manners and customs of the people. Consequently their 1,000,000 yearly certificates of character would not be worth the paper on which they were written, even if they put one dollar each in the consular pocket. We have, in fact, no civil service, either at home or abroad, fit for the application of moral tests to foreigners.

We do not pretend to be wiser on this subject than any one else, but if it be decided that unrestricted immigration, as at present carried on, is dangerous to American institutions and ideals, it is very odd that the value of language as a political and moral test of fitness should be overlooked. Nearly all the really secure or progressive modern States are based on community of language—France, England, Russia, Germany, and Italy. The only two in Europe about whose future there are serious doubts are the polyglot States of Austria and Turkey. All European nationalities have in fact been built up on language. As a cohesive force there is nothing that can compare to language. How a democratic state governed by opinion expressed through universal suffrage could last for any considerable length of time without community of language, it is hard to conceive, for it is through community of language that men are able to feel and think the same way about public affairs, and cherish the same political ideals. Every immigrant who comes to this country speaking or understanding the English language becomes, from the day he lands, exposed to all the moral and social influences and agencies on which we rely for the maintenance and preservation of the American nationality. Everything he hears every hour helps to make him a good citizen. Every man who lands ignorant of English, on the other hand, if an ignorant man generally, is absolutely shielded for an indefinite period against all the instrumentalities of American civilization. No American ideas reach him. American persuasion does not touch him. He remains a foreigner in spite of himself, outside all the great currents of popular thought and sentiment. To feel the pulse or tap the chest of such a man, therefore, in order to ascertain his probable value as a citizen, when he does not know one word of the medium in which the national life, in all fields of activity, is carried on, seems an absurdity on its face.

Moreover, the test of language would be more easily applied than any other. Every immigrant who got in without ability to answer a question in English would be a witness of the inspecting officer's dishonesty, for any one could apply the test. Of course, it would have to be applied under various restrictions. It would hardly do to cut off the relatives and friends of non-English foreigners now resident in this country. Nor would it do to treat ignorance of English as a disqualification in the case of skilled or educated foreigners, for they would be sure to acquire the language promptly after settling here. But, taken for all in all, this test would shut out more of the undesirable element in immigration, and would be easier of application, and would have more practical advantages, than any other that could be devised. It is true, it would to a great extent confine immigration to English, Scotch, and Irishmen, but why not, if the restriction be really undertaken in the interest of American civilization? We are under no obligation to see that all races and nations enjoy an equal chance of getting here. This legislation, as we understand it, is to be for the benefit of the United States; and if the United States is desirous of admitting some Europeans, but only those easiest of absorption, the ones to choose are those who, when they land, can at once enter into intellectual relations with the community at large.

CORRUPT-PRACTICES LEGISLATION.

THE Legislatures of several States are considering measures for the publication and limitation of campaign expenditures, but thus far no law on the subject has been enacted this year. Mr. Saxton's amendment to the New York statute of last year, extending its provisions to campaign committees and their officers, has passed the Senate, but has not yet been acted upon in the Assembly. A bill prohibiting the contribution of money in any form by any person, agent, committee, company, association, or corporation to any person or organization of any kind for use in elections, and forbidding the receipt of such contributions by anybody for such use, has been passed by one house of the Rhode Island Legislature. Two of the most comprehensive measures of the kind which have appeared since the agitation of the subject of legislation of this kind began a few years ago are now under consideration in the Legislatures of Massachusetts and Minnesota. In totally different ways they aim to meet and overcome the evil of the undue and corrupt use of money, and are obviously the outcome of such intelligent and thoughtful study of the problem that they deserve careful consideration.

The Massachusetts bill, though following somewhat the lines of a measure which passed the lower house of the Legislature in 1889 and was defeated in the Senate, is in many respects an original piece of legislation. It requires that all committees and organizations of any kind assisting in the nomination, election, or defeat of any candidate for political office shall have treasurers, and shall cause to be kept detailed accounts of all money, securities, and equivalents of money received or promised to them, and of the manner in which the same have been expended, and of all payments, liabilities, or promises of payment made by them. Within four weeks after election, all treasurers must file sworn statements of all transactions in which they have been engaged during the campaign, giving itemized accounts of all receipts and of all disbursements. Every member of a committee or organization who

receives or disburses money or its equivalent in any form is required to make a detailed statement to the treasurer, who must include it in his sworn return. Every candidate before any caucus or convention, or at any election, must also file sworn statements in detail of all receipts and disbursements of which he has personal knowledge. Every payment of a sum exceeding five dollars to any one person for expense in election must be vouched for by a bill stating particulars and by a receipt.

There is no limit placed to the expenditures candidates may incur, but blank forms are specified which must be filled out in the sworn returns, and which make it necessary to set down the exact amounts spent on printing, hall and headquarters rentals, stationery, clerk hire, canvassers, and other familiar campaign items. An entirely novel feature of the bill is the bestowal upon the Supreme Judicial Court and the Superior Court of full equity powers to compel any person who fails to file his sworn statement, or files a statement which does not conform strictly to the provisions of the act, to comply with the law. Such equity proceedings may be begun on petition of any candidate voted for in the election, or on petition of ten qualified voters in the same election. The courts are also empowered to advance cases of this kind upon their dockets in order that they may be tried and decided with as little delay as possible. No person testifying in such cases shall be liable to criminal prosecution for anything concerning which he may testify, except for perjury.

The Minnesota bill has no resemblance whatever to the Massachusetts measure, but aims to stop the use of money for corrupt purposes by methods similar to those which have been used with so much success in England under the Corrupt Practices Act of 1883. It limits the expenditures of all candidates for United States Senate, Congress, and State offices to $1,000 each; those of all candidates for county offices to $500 each; those of all candidates for offices in cities of over 15,000 inhabitants to $500 each; and those for all candidates in all other places to $250 each. It forbids the use of any of the money allowed by law for any save the legitimate expenses of election. It defines lawful uses, and specifies a long catalogue of unlawful uses, which includes entertainments of all kinds, defining undue influence, in fact, with almost as great minuteness as the English statute does. It forbids the use of money by candidates or by anybody else, and also the contribution of it to be used to influence in any manner the vote of any person. In this respect it is drawn with much the same care and fulness as our New York statute. It also forbids betting of all kinds on the results of an election, and forbids bulldozing, intimidation, and violence by anybody, whether individual or corporation. Sworn statements in detail of all receipts and expenditures are required within ten days after election from both candidates and campaign committee officers. Penalty for violation of any of the provisions of the act is made a misdemeanor punishable with imprisonment for not less than three months nor more than one year, in addition to forfeiture of office in case of election.

This is a very stringent bill in every way, and is notable as being the first American adoption of the English idea of putting a maximum limit to campaign expenditures. It has passed the Senate and is yet to be acted upon by the House. If it shall become a law, its working will be watched with great interest. The English act has, as we have pointed out on former occasions, succeeded far beyond the most sanguine expectations of its authors. They feared, as did all commentators on their work, that they had placed the maximum limits too low, but experience has shown that they were really a full third too high, since in no election under the law has the total expenditure exceeded two-thirds of the total maximum allowed by law; the fact being that sworn publicity has made it impossible to expend the maximum amount without violating the provisions of the law.

THE ITALIAN MONARCHY.

An article in the last number of the *Contemporary Review*, signed "A Continental Statesman," is exciting a genuine sensation in Europe. No guessing at the author appears to have been thus far successful, but that he is what he calls himself, and that he writes as a man who has been behind the scenes in the foreign politics of the Continental States, there appears to be little doubt. That he is either a Frenchman or an Italian also appears to be very certain, and most probably a Frenchman. He talks as an avowed champion of "Latinism" as opposed to "Germanism," and, unless he is taking great pains to disguise himself, he is a foreigner, but a respectful and sympathetic one, to the Italians.

His position is that the Italian monarchy is on the edge of an abyss, and that unless there is a complete change of policy, both foreign and domestic, within a very brief period, the House of Savoy will cease to reign and will be succeeded by a republic. He opens by recalling Mamiani's prediction in 1849 that "Rome must belong either to the Pope or Cola Rienzi," and Mazzini's still more pregnant one, that "Crispi will be the last Minister of the Italian monarchy." He then goes on to give the reasons why, in his opinion, the danger of their fulfilment is rapidly increasing. The House of Savoy should, after the foundation of the Italian kingdom in 1870, have thrown in its lot formally with France, not as a matter of gratitude for past assistance, but because France, as Latin and democratic, is the natural ally of Italy, which is also Latin and democratic. Instead of this the House of Savoy threw the French alliance overboard, and, although the origin of the monarchy was revolutionary, allied itself with that of Germany, which stands for divine right and is the hereditary foe of the Latin races. This would have been unfortunate, considering the great recuperative powers of the French people and the value of their trade and friendship to the Italians, even if it had entailed no immediate burdens or sacrifices. But it led before very long, almost inevitably, to the formation of a military alliance directed against France. This compelled Italy, before the new kingdom had been fairly consolidated, the Administration reformed, the finances regulated, or the population educated (or, as regarded a portion of it, civilized), to set on foot an army and navy about twice too expensive for its means, and begot a colonizing rivalry with France which plunged the kingdom into the deplorable Abyssinian adventure. As a consequence of this, the finances have been thrown again into disorder. Here is now the situation:

> "In the year 1881, the last year of the policy of political neutrality, the expenditure, ordinary and extraordinary, of the kingdom was 1,229,578,938 lire (little more than £49,000,000 sterling). In 1889, the eighth year of the policy of alliances, the ordinary and extraordinary expenses were 1,740,578,938 lire (nearly £70,000,000 sterling). The treasury is therefore actually burdened with an outlay of over £20,000,000 sterling more than when Italy did not swerve from her neutral policy, and thus the policy of alliances has augmented the charge on the taxpayers by 40 per cent. In 1881 the policy of neutrality enabled the Government to announce a surplus of 51,000,000 lire (£2,000,000); in 1888–89 the system of alliances added to previous deficits a new one of 230,000,000 lire (£9,000,000)."

This was followed by the abrogation of the Treaty of Commerce with France, and the adoption of the policy of high protection in 1887. Ever since then the exports and imports have been diminishing. The public credit has been well-nigh ruined. Italian paper is no longer negotiable in the French money market, and the stoppage of a great number of industries dependent on the accommodation given by French discount banks has thrown vast bodies of people out of employment. The taxes in the meanwhile grow in the inverse ratio of the ability of the people to pay them.

All the great modern revolutions have been caused by taxation—the English Revolution of 1640, the American Revolution of 1776, and the French Revolution of 1789. The present situation in Italy cannot last. The burdens of the Triple Alliance are intolerable. They would not be borne patiently much longer even in a country in which the monarchy was rooted in the soil. They are sure not to be borne indefinitely in a country in which the monarchy is of recent and revolutionary origin. Even if the popular attention should be distracted from domestic troubles by the outbreak of a war between France and Germany, sure relief could not come of it. In truth, one danger would be substituted for another. The Italian army might suffer a crushing defeat in the field, and a monarchy of revolutionary origin, like that of the Bonapartists or that of the House of Savoy in Italy, would be swept away on the morrow by a wave of popular rage and disappointment. Nothing but a republic would or could, in a democratic and by no means homogeneous country like Italy, take its place.

The "Continental Statesman" also lays great stress on the failure of the new kingdom to come to terms with the Pope. The Papacy, he says, cannot restore the temporal power, but it cannot be reconciled with the

monarchy. With a Federal Republic he thinks it could be reconciled. The moral power of the Pope, as the one potentate of the modern world who has envoys in every foreign village, he still thinks enormous, and one against which no Catholic State can afford to contend indefinitely; but this part of the article is a piece of politico-religious speculation of which it is difficult for an outsider to estimate the value. The impressiveness of the purely political part every reader must feel.

MAFFIA, CAMORRA, BRIGANDAGE—ALIAS CRIME.

LONDON, March 28, 1891.

IN 1861 the chief aim, one might say, of all patriots who had assisted in the political liberation of Italy was to extirpate crime. I remember on the first day of Garibaldi's entry into Naples that old Mignogna, one of the most devoted patriots and conspirators that could be found the country over, presented to us a splendid specimen of a Neapolitan gentleman, Signor Mele, saying, "Our friend here wishes you to be the guests of his wife. He has a beautiful house at St. Lucia. I have consented to second his wish on condition that he promise to accept a high position in the new police which must be organized immediately." We were amazed: the police in Italy, even in the northern provinces, is not a department into which educated men care to enter. But Mignogna, taking us aside, said, "You ought to insist on this. Mele is the sworn enemy of the Camorra, and he knows more about their haunts and method of action than any one else who belongs to our national party and who cares for unity and independence. The Bourbons [he really said Francischello] will now be enrolling the very worst of the crew; we must be on the alert, for though we are in Naples we are by no means masters of the provinces."

Well, we became the guests of the family of Signor Mele, and spent there all the time not engaged with the wounded. Once I remembered that Mazzini came there, though even he, knowing little of the social conditions of Naples, was surprised to find himself in the house of an "active inspector of police." From Mele we learned the true nature of the Camorra, though he did not trouble himself with its supposed political origin, or with its so-called historical antiquity. It is, he said, a band of malefactors who enlist the young to steal, to commit crime, to do their dirty work, to wound, to commit murder. All are ready to sell themselves to the highest bidder; and as the ramifications of the Camorra extend everywhere, and, one may say, have their centre in the prisons, exceptional measures, as they are called, are useless. We must not make martyrs of the leaders, but isolate them as much as possible, and, above all, inspire confidence in the honest citizens of all classes—make them feel that a national Government is strong enough to protect them even against the Camorra. And all the time that Garibaldi remained in Naples Signor Mele waged a constant, relentless war against the Camorristi, never threatening, nay, often warning them: "Don't do this; don't attempt that. The days for such things are over and gone. Better seek a trade and settle down to honest work." And Mele had enrolled a very able, active, and honest police force, which, alas, like many things Garibaldian, was dispersed and destroyed after the inauguration of the moderate governors and rulers in Naples.

Silvio Spaventa was appointed Minister of Police. From 1849 to 1860 he had passed his life in the galleys with Poerio and the other victims of Bomba. He was a constitutionalist, an anti-Garibaldian; he thought that the Camorra could be rooted out by expelling all who had taken part in the revolution and inaugurating a rule of iron. Mele differed with him, but they were old friends and worked each in his own way. Towards the middle of the year 1861, Mele had made great progress in getting at the chiefs of the Camorra, which, after Garibaldi's departure, reappeared in force. He knew that the papers of the sect were hidden at Pozzuoli; he went there, arrested a number of Camorristi, and seized all the papers. On his return to Naples he called for his little son, then at a day school—called him by name, and the boy answered from a window. A beggar woman asked for alms. Mele turned to give her something, and a young fellow cut his throat across. Mele fell dead; the assassin and the woman rifled his pockets of all the papers, leaving his watch, chain, and purse, and then escaped. The city was in a state of the wildest excitement, which the Camorristi fomented, spreading the rumor that Spaventa had persecuted Mele as a Garibaldian! Spaventa had to fly for his life, but the murderer was secured by Mele's friends, and, being a lad not eighteen, was condemned not to death, but to the galleys. After this, brigandage, fomented by the Bourbon and the priests, the Camorra in the city of Naples, and the so-called Maffia in Sicily, raised their heads again triumphantly.

The Government, especially in Sicily, resorted to horrible measures of repression. In Sicily, where conscription had hitherto been unknown, the priests aided the conscripts to evade the law; they hid in sulphur mines and in the mountains; whole districts were placed in a state of siege, and yet no headway was made. It was said that all the police were Maffiosi, that the guardians of the rural districts were the protectors of the association; many of these were changed. Then Parliament decreed an "inquiry," and members of all parties were chosen to go through the provinces and report. Aurelio Saffi was one of the members; Massari, Cavour's adorer and biographer, was the reporter for the Commission. Its chief use was to bring home to the Government and to the public a true picture of the abject misery, the inconceivable ignorance of the masses, the total absence of any care or thought for them by the proprietors of the soil. In Sicily, for many successive years, there were periodical revolutions, so called, which meant that the malcontents recruited brigands and malefactors to get up an occasion for rapine, plunder, and revenge.

After 1876, when Nicotera, the present Minister of the Home Department, first assumed that office, a radical change took place for the better. In Naples the Camorra was severely handled and the prison system changed. Education has done something, but not as much as the conscription. At this assertion the adversaries of standing armies will stand aghast; but it is a fact that the enrolling and taking from their miserable dens of vice, misery, and oppression of thousands of young men of twenty years of age, their sojourn in other parts of Italy with men of their own class (as the peasants furnish at least 80 per cent. of the entire army), but with quite other manners and customs and hopes and ideals, combined with strict discipline, good food, and daily instruction, has worked wonders both in the island of Sicily and on the Neapolitan continent. Brigandage as it used to be understood is exterminated. The Camorra in Naples, though it still exists, is very much diminished. Criminals there are, as everywhere, but the *galantuomini*, as they are called, to distinguish them from the lazzaroni, no longer stand in awe of them or pay blackmail to protect their lives and their persons.

In the island of Sicily the late Government bent all its efforts to the elevation of the masses by education and by offering inducements to the best class of civil servants and elementary school-mistresses and masters to go and remain in the island. Many infant schools have been set on foot, and it is a fact that there *is* progress everywhere. In the present Cabinet there are two members who have distinguished themselves in the fight with these special products of centuries of misrule, of superstition and neglect — Nicotera, of whom I have already spoken, and Pasquale Villari, who has devoted a considerable portion of his life to seeking the causes of the degradation of the southern masses, and in propounding and asking others to propose remedies. Di Rudini was Mayor of Palermo during one of the most terrible rebellions, and he suppressed it thoroughly. As a large Sicilian proprietor, he probably knows as much as any other man what the Maffia really means. In his last useful and most interesting pamphlet, Signor Bodio gives, under the title 'Di alcuni indici misuratori del Movimento Economico in Italia' some very sad statistics concerning crime in Italy, in which, though he tells us it is diminished, Italy still ranks second, after Spain, in Europe. Taking all the crimes reported to or discovered by the authorities in the kingdom, he classifies them, and shows the annual average for ten years (*i. e.*, between 1879 and 1889) for 100,000 inhabitants. First on the list stands murder—"simple murder, or murder with robbery." The Italians call all murder homicide. Highest on this black list stand Calabria, where every year 1,416 murders for every 100,000 inhabitants are committed; Sicily comes next, with 1,020; Sardinia, Rome and the Roman province, the Abruzzi, Campania, Molise, and Basilicata follow, all with their terrible four figures. The Marches and Umbria, Tuscany, which surprises one, come next, but with a vast diminution to 13 and 10 per 100,000. Liguria shows 9, Piedmont and Emilia 7; and Venetia is lowest on the scale, having but 5⅓. Thefts are highest in the Island of Sardinia and in the Lazio or Roman province, and again lowest in Venetia and in Piedmont. Immorality (or such crimes of that class as come under the action of the law) is least in Sicily, Emilia, and Piedmont; greatest, in a marked degree, in the old priest-ruled provinces of the Lazio and again in Calabria.

It is a gloomy picture after twenty years of unity and independence, but it is a great gain that the Italians do not shrink from their researches after crime, nor try to hide the hideous facts from the public. At the same time, their very earnestness in the repression of crime when it is met with, and the proof given even by these late statistics that it is vastly on the decrease, will account in great measure for their excitement and horror at the late tragedy in New Orleans. Ever since the bad old times of political oppression, the United States have been the favored and favoring asylum of the Italians, and their record on the pages of all the States has been one of a hard-working, sober, abstemious, and non-meddling immigration. Even the last report speaks well of them. With the exception of the Irish, with whom they do not generally sympathize —perhaps on account of the strong *pro-tempo-*

ral proclivities of the former—the Italians have never come into open hostility with any section of the Americans. During the Civil War, of course, all the Garibaldians were intensely Northern. If in 1860 Garibaldi had accepted the offer of the Federal Government, two-thirds of his volunteers would have accompanied him to fight for the liberation of the slaves. But he was needed at home, and so nothing came of the project. Since 1870 the commerce between the two countries has increased gradually and greatly, as has also the emigration, until perhaps the last two years, when large numbers have emigrated in preference to the Argentine Republic and Brazil. The Sicilians have always had a preference for New Orleans, and their colony there is regarded with pride and hope at home. They have there ten patriotic and benevolent societies, with $20,000 reserve. Only last January they sent home to their families in Sicily 300,000 lire ($60,000), depositing other $20,000 with the Consul. Their houses and steamers are well known; we have a list of some of the best names in Sicily. If we take the imports and exports of the island, we find that the United States are by far their largest consumers.

When the first news of the murder of Mr. Hennessy reached Italy, all the Italian press gave prominence to the fact; but assuredly it was not believed that the Italians had been the murderers. It was never thought for a moment in Italy that the murder was the deed of an association, because it was not believed that the Maffia, which is a home production, had been exported to New Orleans. When the trial came on, it was shown that money had been subscribed for the defence of the accused by the first American advocates, and, as far as we can see, there was not an Italian among the jury. Then came the news of the acquittal of six, the condemnation of three, the non-agreement of the jury for other three. Had the following news been of a second trial, *pazienza!* But a fiendish, cold-blooded murder of prisoners safe in prison, by American citizens, can no more be understood in Italy than would be the revival of the stakes and tortures of the Holy Inquisition. How is it possible, they ask, that, in a population of nearly 300,000 souls, a jury of twelve honest men and true could not be found? Is it credible that they could all stand in awe of a handful of miscreants, even admitting that there be an association of such? And when once they doubted of the justice of the verdict, why not arrest the jurors—why not have demanded a new trial?

It is evident that miscreants and malefactors *have* taken refuge in New Orleans. These are the clandestine emigrants who evade the police and the mayors because they want to escape the conscription or the law itself. It cannot be difficult for the large colony of wealthy, industrious, law-abiding Italians in New Orleans to establish a police of their own, to ascertain the name of every Italian in the State, his profession or occupation, his past, present, and probable future. Without committing any crime or even espionage, they can easily get rid of all would-be delinquents, as another colony of Italians have done in a large city annexed by another country.

J. W. M.

TALLEYRAND'S MEMOIRS.—III.

PARIS, April 1, 1891.

TALLEYRAND became Minister of Foreign Affairs at a moment when there was a general vague desire for a change in France. The words liberty, equality, fraternity were inscribed on all the walls, but the things which these words expressed were nowhere. Everything was violent and arbitrary. Gen. Bonaparte was filling the scene, and he was full of ambition and of genius. When he started for the expedition to Egypt, Talleyrand confided to him that he was going to resign. Bonaparte asked for him the embassy to Constantinople, feeling that he might need him as a negotiator in the East. Talleyrand resigned and waited, in the country, for coming events.

When the revolution of the 18th Brumaire took place after Bonaparte's return, Talleyrand immediately accepted the Foreign Office. The battle of Marengo, June 14, 1800, made the First Consul a true sovereign of France as well as the master of Italy. By the peace of Amiens, France found herself reunited to all the great Powers. A concordat was signed between France and the Holy See, and Talleyrand took a great part in this reconciliation. Bonaparte obtained from the Pope a brief for Talleyrand's secularization. (It was dated June 29, 1802.) After the conspiracy of Dumouriez, Pichegru, and Moreau, Bonaparte changed his title of Consul for life to that of Emperor. Talleyrand says but little on the question of the execution of the Duc d'Enghien:

"The violent and inexplicable death of Pichegru, the means employed for obtaining the condemnation of Moreau, might be put to the account of policy; but the assassination of the Duc d'Enghien, accomplished merely in order to secure the alliance, by placing himself in their ranks, of those whom the death of Louis XVI. made fearful of any power not conferred by their hands—this assassination, I say, could be neither excused nor pardoned, and it never has been. Bonaparte was therefore reduced to boasting of it."

The Duc de Broglie tells us in a note that Talleyrand wrote a special chapter on the assassination of the Duc d'Enghien, but it will appear only in one of the forthcoming volumes. We will therefore not dilate on an event in which the part of Talleyrand has not yet been clearly defined.

It was not enough for Bonaparte to have been proclaimed Emperor of the French, not enough to have been consecrated by the Pope; he assumed the iron crown at Milan, and, instead of calling himself King of Lombardy, took the name of King of Italy. Napoleon formed a camp at Boulogne and threatened to invade England. He suddenly turned his army towards the Rhine. Talleyrand received orders to go to Strasbourg and accompany the headquarters. The day of the Emperor's departure for Strasbourg, Talleyrand dined alone with him; he says that he was much alarmed because after dinner the Emperor had a fit, the convulsions lasting a quarter of an hour. Half an hour after, Napoleon was on his way to Stuttgart. On arriving in that city, Napoleon wrote to him: "I am well. The Duke of Würtemberg came to greet me outside of the first *grille* of his palace; he is a sensible man." In a second letter, written the same day, he said: "I have news of Mack; he is marching as if I guided him myself; he will be caught in Ulm, like a *vilain*." And so it was; the capitulation of Ulm was followed by the triumph at Austerlitz. During the negotiations, Talleyrand did all he could in favor of Austria: "You made for me at Presbourg," wrote Napoleon to him some time afterwards, "a treaty which much hampers me." The Emperor, however, gave him a mark of his satisfaction in naming him Prince of Benevento. Talleyrand never saw this Duchy of Benevento, one of the ugliest parts of Italy, between Naples and Foggia, on the crest of the Apennines, but he kept it till the time of the Restoration.

Talleyrand was all along opposed to the revolutionary policy of Napoleon in Europe, to his annexation of provinces and kingdoms to France, to his distribution of crowns to members of his family. He was by nature a Conservative, and he saw in Austria a necessary remnant of the old Empire and a bulwark against the ambition of Russia. Napoleon, who was the armed representative of the Revolution "se fit un jeu des sceptres et des lois," to cite a verse of Béranger's. He knew no obstacles, he respected no tradition and no treaty. He effected one conquest after another; he could not stop in his destructive career. After Austerlitz came Jena; when Prussia was at his feet, he turned suddenly on Spain, and swore to destroy the Spanish branch of the House of Bourbon. "And I," says Talleyrand, "I swore to myself internally to cease, at whatever cost, to be his Minister as soon as we should be back in France."

Talleyrand was a sort of philosopher and moralist; his observations are often curious: "What a singular spectacle it was to see Napoleon, on coming out of the cabinet of the Great Frederic, where he had been writing a bulletin for his army, enter the dining-room and dine with Möllendorf, who was his prisoner, and Müller, the historian of the Prussian monarchy; offering them their salary, which they accepted, then entering his carriage and starting for Posen." Talleyrand negotiated the peace of Tilsit, after the famous interview which took place on a raft on the Niemen between Napoleon and the Emperor Alexander. The conditions imposed on Prussia were excessively harsh. "How," said one day Napoleon to Queen Louise of Prussia, "with such feeble means as you had, did you dare to make war on me?" "I will tell your Majesty: the glory of Frederic II. had deceived us as to our own power." "This word glory," says Talleyrand, "so happily placed, and at Tilsit, in the salon of the Emperor Napoleon, seemed to me very grand." Talleyrand showed many attentions to Queen Louise, and when he conducted her for the last time to her carriage, "Prince of Benevento," said she to him, "there are but two persons who regret that I should have come here—you and I. You are not sorry, are you, that I should carry away this opinion?"

The efforts of Queen Louise had been vain; Napoleon was inflexible. He flattered himself also that he had made a dupe of Alexander of Russia; "but time showed that the true dupe was himself." After a whole year spent in Germany, Talleyrand returned to Paris, with the title of Vice-Grand Elector. He left the Foreign Office immediately; he did not agree with Napoleon on the subject of Spanish affairs. Napoleon avenged himself by choosing Valençay, which belonged to Talleyrand, as the prison of Ferdinand VII., his brother, and their uncle.

When the Emperor Alexander and Napoleon saw each other at Tilsit, they promised each other to meet again. It was a promise which Napoleon did not care to keep; but, after the disasters of the French in Spain, he was afraid that Austria would take advantage of the situation, and he felt the need of drawing nearer to Russia. The second interview took place at Erfurt. The Emperor Napoleon, though his relations with Talleyrand had already become very frigid, wished him to accompany him. He had persuaded himself that it would be useful to him, and that was

enough. The chapter of the Memoirs on the interview at Erfurt is an historical page of the first importance; it is, so far, the masterpiece of the work; it is a picture which is truly admirable. Napoleon moves in it, speaks, acts, as if he were alive. His wonderful genius, extending to everything, is painted in the most vivid colors. Talleyrand is sincere; he does not detract anything from Napoleon, though he already considers him a sort of public enemy, a curse to the world; his admiration is not diminished by his foresight and by a sort of curious antipathy which he, a representative of the past and of the old régime, feels instinctively for the *parvenu*, for the upstart who takes pleasure in the humiliation of the old dynasties. Talleyrand also appears in this chapter as a great writer; he has made for himself a style, not very correct, perhaps, but very personal, marked by extraordinary shades and delicacies, by attenuations and circumlocutions which all have their importance. I will give an instance of this style:

"I am tempted to believe, and the thought of it came to me at Erfurt, that there are secrets of flattery which are revealed only to princes—not to such as have been dethroned, but to those who have placed their thrones under a threatening protectorate. . . . There is a reason for this. . . . The small princes wish that their courts should conceal the narrow limits of their power. Everything is magnified and puffed up about a petty sovereign—etiquette, attentions, flatteries. It is by the flatteries specially that he measures his greatness; he never finds them exaggerated. This way of thinking becomes natural to him, and he does not change it when fortune changes. If victory brings into his states, his palace, a man before whom he is himself no more than a courtier, he falls as low before the conqueror as he wished to see his subjects before him. He cannot form another idea of flattery. . . . I did not see, at Erfurt, a single hand pass nobly over the mane of the lion."

This page would not be out of place in La Bruyère or Pascal. It has often been said that at Erfurt, when Napoleon invited all the sovereigns and princes who had come there to greet him to the gala representations at the French Theatre (he had sent Talma and the whole troupe to the little German city), he had a *parterre de rois*. I forgot who said, "A *parterre?* you mean a *platebande!*" a joke which explains itself if you separate the word platebande in two, and which is meant to express forcibly the attitude of all the princes who were at Erfurt.

Talleyrand speaks at length of the conversations between Napoleon and Goethe, and, in his account, the greatest of all German writers loses nothing. The poet and the Emperor talked and discussed literary points with perfect ease. Napoleon told Goethe that if he wrote anything about the interview at Erfurt, he ought to dedicate it to the Emperor Alexander. "It is not my habit. When I began to write, I made it a principle never to compose a dedication so as never to repent of it." "The great writers of the century of Louis XIV. were not like that." "It is true, Sire, but your Majesty could not feel sure that they never repented of it." "What has become of that rogue Kotzebue?" "Sire, they say he is in Siberia, and that your Majesty will ask the Emperor Alexander to pardon him." "Well! do you know he is not my man?" "Sire, he is very unfortunate, and has much talent." "Good-bye, Mr. Goethe."

Napoleon chose with much care the plays which were to be represented before the sovereigns. He would have Corneille's "Cinna" because there are in it verses which absolve the crimes committed by a great man who seizes the crown:

> "Et dans le sacré rang où sa faveur l'a mis
> Le passé devient juste et l'avenir permis.
> Qui peut y parvenir ne peut être coupable."

"It is excellent," said he to Rémusat, "for these Germans who still talk of the death of the Duc d'Enghien; we must widen their morals. I don't refer to the Emperor Alexander: such things seem nothing to a Russian. It will be good for the men with melancholy ideas who fill Germany."

Correspondence.

A NEW ATTACK ON COMMERCIAL FREEDOM.

To the Editor of The Nation:

Sir: The people of the United States have heretofore been engaged in fighting for their rights as citizens of one country under the so-called commerce clause of the Constitution. That alone secures a pretty large class of those rights which people think are natural, and therefore suppose need no protection. The enemies have been the States which theoretically are foreign to each other. We are now meeting a new phase of the efforts to destroy the freedom of intercourse within the United States for the purposes of trade. The famous oleomargarine legislation is a specimen. Another is seen in the case of Bremer vs. Robinson (128 United States 78, January 19, 1891), where the Legislature of Virginia is convicted of an evasion of the Constitution by prohibiting the importation of fresh meat, under the device of an inspection duty of one cent a pound. And when we recall the numberless instances in which traders from other States have been sought to be excluded, it is no exaggeration to say that loyalty to the great principle of the Constitution—the unity of the people of the United States for purposes of trade—does not exist, and is enforced by the power of the Supreme Court only.

We have now to meet statutes that violate the rights of a State's own citizens. Will not the community be surprised to learn that any State has the power to make it criminal for one of her citizens to make any contract with a citizen of another State? About this the Supreme Court of Pennsylvania *have no doubt whatever* (Com'th vs. Biddle, 27 Weekly Notes of Cases 289). A mill-owner, by letter and check drawn in Philadelphia, insured his mill in a Massachusetts corporation. He was convicted and fined as for a misdemeanor. The Supreme Court, declaring there was no doubt as to the power of the Legislature to make this act criminal, discharged the defendant because, and only because, they thought the law did not mean to make it criminal in him, but only in the insurer or his agent, to make such a contract.

It appears to me that this suggestion to the unscrupulous of a mode of compassing their ends is one of the most dangerous that have as yet been made. The rights of citizens are most carefully protected against discriminations in favor of citizens of other States by section 2 of article ii. Did it not occur to the framers of the Constitution that it might be necesssary to secure them against discrimination in the form of prohibiting dealings with persons out of the limits of their own State? Consider what this means. To foster domestic resources, it may be made felony to invest out of the State. A sentence that recognizes this power certainly deserved more consideration than it appears to have received. For if we consider the *ratio decidendi* as the decision (which, as a guide to inferior courts, it must be taken to be), it is a distinct decision that a contract by letter with a foreigner, unless he is licensed to deal by the Sta e in which the letter is written, may be made criminal in the writer.

The only refuge lies in the commerce clause of the Constitution of the United States. Who of us have been aware of this? That it is ample, I have no doubt. The only thing in the way is an epigrammatic sentence of Mr. Justice Field, in Paul vs. Virginia—that insurance is not commerce. For the purpose of that case it may be perfectly correct, but it has the vice of all generalizations. The way to test this is to ask, Could any one conduct commerce if forbidden to insure? It would be possible, certainly, but practicable, certainly not. A person thus hampered would be in the same position as one prohibited from buying on credit or drawing bills.

The subject deserves an essay; but to those who can appreciate the consequences that are involved in such a dogma, sufficient has been said to attract attention to the subject.

R. C. McMurtrie.

Philadelphia, April 15, 1891.

THE CANADIAN ELECTIONS.

To the Editor of The Nation:

Sir: I read with interest and pleasure the editorial paragraph, upon the result of the late general elections in Canada, which appeared in your issue of March 12, and with a certain degree of surprise the animadversions upon that paragraph, by Mr. A. Ferguson of Ottawa, published in the *Nation* of the 26th ultimo. Looking at all the circumstances of the case, you were justified in saying that the elections had "resulted in a practical defeat of Sir John Macdonald and the Conservative party," and you were—without any qualification—correct in the statement that "although they have secured a numerical majority, they have met very serious losses."

The Government went into the conflict with a majority of 49 and came out with a majority which Mr. Ferguson places at 33 or 35, but which will probably be found to be less than 30. They had at the time of the dissolution 57 members from Ontario, as against 35 supporters of the Liberal party. Now they have 47, as against 44. In Quebec, where the Government had a majority of 5, the Opposition now count 37 members against their 28. The very serious losses, in the two great central provinces, indicated by those figures, are not made up for by the gain of five seats in the eastern maritime section of the Dominion. Mr. Ferguson tries to break the force of this showing by going back to the elections of 1887, when Sir John Macdonald was kept in power by a comparatively narrow majority, instead of comparing his strength after the recent elections with his strength immediately before. When we look at the tremendous influence wielded through the whole length of the Dominion—from Nova Scotia to British Columbia—by the Canadian Pacific Railway Company, and know that it was exerted to the utmost on behalf of the Government; when we are made aware that the Conservatives controlled an enormous campaign fund obtained from the protected manufacturers, from contractors, and from other sources; and when we consider the fact that the false cries of "Treason" and "Annexation" were deliberately raised against the Liberal party to prejudice them in the eyes of

a loyal people, and that, owing to the shortness of the campaign, those cries were successful in a greater degree than would naturally have been expected, we cannot fail to see that Sir John and his party have, as you said, met with a "practical defeat." Had the result of the elections indicated the true sentiment of the voters on the respective policies of the two parties, the defeat would have been absolute and decisive.

You were also, in my humble opinion, perfectly correct in saying that the result of the elections betokened "the early breakdown of protectionism in the Dominion." Ontario and Quebec were the strongholds of the National Policy, as protection is absurdly miscalled in Canada: there are few manufactures in the Lower Provinces, and almost none in Manitoba, the Northwest Territories, or British Columbia. Outside of Ontario and Quebec, the overwhelming majority of the people have always been in favor of a low tariff. The result of the elections has been to leave the Government, which went to the country with a majority of twenty-seven in those two provinces, in a minority of six. To the ordinary mind this change would indicate an early breakdown of the protective policy. As a matter of fact, prominent Conservative papers have admitted that the elections have shown that the existing tariff needs reform in the way of reduction; and the Rev. Dr. Grant, the distinguished Principal of Queen's University at Kingston, Ontario—himself a Conservative—tells us that "The National Policy in its present shape has won its last victory. Trade restrictions against the whole world cannot be maintained. . . . We must extend our trade relations with the United States or with the rest of the world."

It is somewhat singular that Mr. Ferguson should now claim that, instead of, as you had said, rebuking Sir John Macdonald for putting forward the pretence that the Dominion would, under reciprocity with the United States, lose the power of self-control, "the electors by a large majority rebuked the Opposition leaders for embracing the unpatriotic policy of unrestricted reciprocity," whereas during the campaign neither Sir John nor, so far as I am aware, any of his followers discussed the merits of the policy of unrestricted reciprocity at all. Sir John, in his manifesto to the electors, deliberately confounded unrestricted reciprocity with commercial union, and then claimed that such a policy would lead to annexation; and his example was followed with great zeal and energy during the campaign, in the press and on the platform, throughout the country by his lieutenants. It may be mentioned in passing that in Nova Scotia the Liberals were further credited with the intention of handing over the inshore fisheries to your fishermen, when, as a matter of fact, their policy did not profess to deal with the question of fishing rights.

You will perhaps allow me to explain briefly the origin and nature of the much maligned Liberal policy of unrestricted reciprocity. The so-called National Policy had failed to make every one rich and happy as it had been guaranteed to do, and the stronger the grip of the policy upon the country grew, the stronger grew also the feeling of dissatisfaction of the many who were being legally plundered for the benefit of the few. The only remedy suggested by the Government party was the proverbial hair of the dog that had bitten—more protection; higher duties on goods already protected, and duties upon farm products and other articles as yet untaxed. Our experience in this respect has been the same as yours, although our present tariff falls considerably short of the perfection of Major McKinley's masterpiece. The Liberal party, remembering the great benefits conferred upon both the United States and the British North American provinces by the Reciprocity Treaty of 1854, thought that the best remedy for existing evils was to be found in a renewal of that treaty, either in the original or in some modified form. There was every reason to believe that the United States would not agree to a renewal of the Treaty of 1854, or to any treaty which did not include the manufactured as well as the natural products of the two countries. In the session of 1884, Sir John Macdonald, speaking in the House of Commons upon a resolution in favor of reciprocity, introduced by Mr. Davies, a Liberal member from Prince Edward Island, used the following language:

"Unless the United States will come at some time or other to the conclusion that they would be willing to enter upon a reciprocity treaty not only for our natural productions, but for our manufactures as well as our natural products, we will never have a treaty. I am quite satisfied the United States will not agree, the country will not agree, the voice of the country will be against a repetition of the treaty of 1854. Then, sir, the only question is this: 'Can we have a treaty on a larger basis?'"

The feeling of the Republican leaders in the United States at a somewhat later date could be gathered from a passage in a speech made by Mr. Blaine at Lock Haven, Pa., in October, 1886:

"Some time ago," said Mr. Blaine, "one of the eminent men in Canada asked me to use what little influence I possessed to urge upon our people the propriety of a reciprocity treaty which it was understood, he said, our Minister was then negotiating at the Court of St. James's. I asked how it would do to make a clean thing of it and let into the United States free of duty everything they produced, everything we produced to be let into Canada free of duty. . . . I said, 'Will you let in our cotton and our products of leather, iron, steel, and the thousand and one others of our products?'"

The Liberals (in 1888, if my memory is not at fault), seeing no chance of obtaining reciprocity in natural products alone, decided to adopt the course indicated by Sir John Macdonald and Mr. Blaine, and to advocate reciprocity in manufactured as well as natural products; and accordingly, in the session of 1888, Sir Richard Cartwright introduced a resolution in the House of Commons favoring what is now known as unrestricted reciprocity. I may remark that, at a gathering of the Liberal members at Ottawa held shortly before to consider the fiscal policy, commercial union was disapproved of by an overwhelming majority, on the grounds that the United States customs duties are much too high, and that, under that system, Canada would lose the power to frame her own tariff as to the world outside herself and the great Republic. The Liberal policy differed from the Conservative in offering to add manufactures to natural products, as to which both parties were substantially agreed. I do not propose to deal with the difficulties which might arise in the practical working of the scheme of unrestricted reciprocity, if it was agreed upon by the United States and Canada; but the statesmanship of the two countries could, I think, be trusted to find means to overcome them. If the United States declined to enter into a treaty providing for reciprocity, the Liberal policy would be, not annexation nor commercial union, but such tariff reform as would lighten the burdens of the farmers, lumberers, miners, fishermen, and all classes of the community outside the factory-owners, while leaving enough incidental protection to enable any manufacture suited to the country to hold its own against foreign competition.

This fiscal policy of the Liberal party, so just, reasonable, and patriotic, was described by Sir John and his followers as being identical with commercial union and as leading necessarily to annexation. True, the treaty of 1854 had not tended in that direction, and one could see no reason in the nature of things why the addition of manufactures to the free list should bring about so marked a change in results; but that was the ground taken by the Conservatives. As our Canadian comic paper, *Grip*, put it, free trade in natural products was exuberant loyalty, while free trade in manufactures was rank treason. The Liberal policy had been before the country for three years, and had been discussed at length in Parliament, and to some extent in the press and on the platform, and its disloyalty was not made an issue until the premature dissolution. Clearly then, Mr. Editor, you were perfectly right in saying that the Conservatives "raised the cry of annexation to frighten the timid."

Allow me also to express my entire concurrence in your declaration that the result of the elections did not "betoken any near approach to annexation." There are, as far as I know, but few annexationists in Canada, and there is no party favorable to annexation. We can admire the manifold greatness of your country and the numerous good qualities of her population, and even realize that the Dominion would reap considerable material benefit from a political union with the republic, without feeling tempted to abandon our present connection with the mother country, our substantial independence, and a constitutional system which we prefer to that which you esteem so highly. We Liberals are as loyal as our Tory neighbors, but we think that loyalty alone is not a life-sustaining food, and that we in Canada could, without hurting it, indulge in reciprocal free trade with the United States—even without restriction—to the great advantage of our people.

May I be permitted to add that, even though unrestricted reciprocity might be the most desirable thing for the United States as well as for Canada, a limited reciprocity would also be good, although in a less degree, and good for both parties? Free trade is like mercy: "It blesseth him that gives and him that takes"; and although the general opinion in your country is that the balance of advantage under the treaty of 1854 was decidedly with the British Provinces, my impression is—speaking without book—that the increase in our importations from the United States was in pretty nearly the same ratio as that of our exports to that country. It is, therefore, to be hoped that, even should unrestricted reciprocity be for the present out of reach, owing to the objections of the Imperial or the Dominion Government, your Administration and Senate may see their way to a loosening of the bonds which now impede the natural circulation of the life-giving current of trade between Canada and the United States. Two such countries as those should be able to treat electioneering speeches and newspaper bluster as so much froth or fog which hides for the time being the true character of the stream that rolls beneath. Whatever visionary theorists or interested politicians or monopolists may say, the good feeling and common sense of people on either side of the boundary line declare that the greater the intercourse between the two countries, the better it will be for both.

Your obedient servant, L. G. POWER.

HALIFAX, NOVA SCOTIA, April 4, 1891.

ARCHIEPISCOPAL ENGLISH.

To the Editor of The Nation:

Sir: Among the tests of a strictly correct style, it must be admitted that uniformity in assigning the adverb *only* its due position is one of the most trustworthy. In other words, when predicable of a writer, it may be considered as affording a presumption that he has learned to conform to the most approved precedents; and it also gives evidence, in a small way, of a sense of logical exigency. Very few authors of note have been so heedful in this matter as Lord Macaulay. On the other hand, very few, in days recently gone by, have been more conspicuously the reverse than the late Archbishop Trench. From the seventh edition, published a short time ago, of that prelate's 'Select Glossary,' quotations in support of this contention, with the proper collocation of *only* indicated by brackets, here follow:

"Enormous. Now *only* applied [ ] to that which is irregular in excess." P. 95.
"Which, indeed, is *only* agreeable [ ] to the proper meaning of the word." P. 99.
"In English, we *only* retain the word now in [ ] the second of these uses." P. 130.
"Which, however, is *only* fully intelligible [ ] by a reference to the Greek." P. 141.
"The connotation of moral baseness *only* accrued to the word [ ] by degrees." P. 172.
"The more honourable use of 'officious' now *only* survives [ ] in the distinction," etc. P. 194.
"He is *only* to be perfectly understood, [ ] when we keep in mind," etc. P. 212.
"At present we *only* 'prune' [ ] trees." P. 222.
"Women are intended to be wives, and *only* find the true completion of their being [ ] when they are so." P. 301.
"Debate . . . was *only* true to its etymology (débattre) [ ] so long as," etc. P. 66. See also pp. 12, 61, etc.

That any one who could print, and year after year go on reprinting, the like of this should, in many other respects, fall short of being exemplary in his manner of expressing himself, while it can occasion no surprise, might almost be expected. And here are some samples of Dr. Trench's peculiarities, all of them taken from the little book cited above, making it clear that, however diligent he was in discoursing on our mother-tongue, he was, in employing it, by no means a master:

"I am *persuaded* [convinced] that, in the decomposition, word by word, of," &c. Preface, p. vi.
"The compensations which we look for are most *capable* of being found." *Id.*, p. vi.
"Witnessing for the good, or for the evil, which *have* been unconsciously at work." *Id.*, p. viii.
"Under one aspect or *another*." *Id.*, p. viii. Also in p. ix.
"According to the desynonymizing processes *ever* at work in a language." P. 71. Also in pp. 192, 302.
"'Drench' and 'drown,' though desynonymized in our later English, were once perfectly *adequate* to one another." P. 85.
"'Ecstasy' . . . is no longer used as an equivalent *to* madness." P. 89.
"Having *gotten* this application of the word from the Vulgate." P. 108.
"From the *seldom* use of it." P. 147.
"It *needs hardly to say* that a 'Jacobin' was once a Dominican friar." P. 152.
"It formerly implied *a great deal more and worse* than it implies now." P. 162.
"The two businesses were very closely *joined*, would often run *in, to* one another." P. 165.
"There lies ever, in 'obsequious,' at *the* present, the sense," etc. P. 192. Also in p. 211.
"As it is written three times out of the four *on which* it occurs." P. 197.
"We have *forfeited* the full force of the statement, 'God is no respecter of persons.'" P. 205. Also in p. 289.
"*He* was 'popular' once, *not who* had acquired, *but who* was laying himself out to acquire, the favour of the people." P. 213.
"Terms of *extremest* scorn." P. 221.
"Which once conveyed *intensest* moral reprobation." P. 252. "In which all *chiefest* excellencies," etc. P. 289.
"Once it *did but express* [expressed only]," etc. P. 250. "Words which at first *did but express*," etc. P. 286.
"It conveyed, also, of old, a much deeper moral reprobation than [it does] now or in the Middle English it did." P. 252.
"Men will be content, *for long*, to confuse," etc. P. 256.
"He . . . whose stupor and folly *is* connected with," etc. P. 258.
"Having now no other *but* a literal sense." P. 285.
"Almost all nations regard with disfavour and dislike that which is *outlandish* [foreign]." P. 286.
"Perverted wisdom on *his part to whom* it was given." P. 304.

Anything, in these quotations, to which attention is directed by italics and otherwise, would be marked, I suppose, by a competent teacher, as a blemish, if it occurred in a composition by a lad of sixteen or eighteen.

According to Mr. T. L. Kington Oliphant, "Dr. Trench is a good Teuton, and is, therefore, heartily abused by professors of fine writing." Of such professors and their doings I know nothing; but I think I know what sort of English is approved by persons of rational and cultivated taste, with their disrelish for fatuous fads, conceited eccentricities, and unscholarly carelessness. Be this as it may, if the characteristics of "a good Teuton" are found in such affectations, insipid archaisms, contortions, pomposity, violations of idiom, and false grammar as have been instanced in this letter, it will be allowed, most assuredly, that the less we have of so repulsive a thing as Teutonism, the better.

It is common to see our language, as contaminated by Americans, made a subject of derision. No apology, then, need be offered for having shown that its use even by eminent Britons is not lightly to be accepted as secure from adverse criticism.—Your obedient servant,

F. H.

Marlesford, England, February 15, 1891.

Notes.

Longmans, Green & Co. will publish directly a Life of Charles Macklin, by Edward Abbott Parry, for William Archer's series of "Eminent Actors."

Gebbie & Co., Philadelphia, have in course of publication 'The American Continent and its Inhabitants before its Discovery by Columbus,' by Annie Cole Cady, with illustrations by Henry N. Cady and others. Eight of the twenty-five monthly parts have already appeared. The narrative is addressed to a group of boys and girls, and begins with the formation of the earth.

Prof. George F. Wright's 'Ice Age in North America' is about to appear in a third edition, with a supplementary chapter, from the press of the Appletons.

A third edition of Sanborn's 'Life of John Brown' is on the point of being issued by Roberts Bros., Boston.

Mr. H. T. Finck's 'Pacific Coast Scenic Tour' has reached a second edition within five months of its first publication by the Scribners, and has evidently found favor with tourists.

Mr. Charles Dudley Warner's recent contributions to *Harper's Magazine* on Southern California make a volume of very entertaining and instructive reading, in which scenery, society, and statistics are pleasantly mingled. All the conditions of living there affecting the invalid, tourist, or permanent resident are discussed with a great variety of detail touching climate, soil, natural resources, methods and effects of irrigation, practical results of fruit culture, houses, homes, and the general advance of civilization. One of the most notable chapters describes the author's visit to the Grand Cañon of the Colorado. These interesting papers have now been published by the Harpers in a book of very attractive appearance, amply and beautifully illustrated, and bearing the title of 'Our Italy.'

The anti-pirate edition of Bryce's 'American Commonwealth' (Macmillan) is offered at an incredibly low price, which brings it within reach of every one who buys a book, viz.: $2.50 for two volumes. It is the plain duty of every intelligent citizen to possess himself of this work, and to buy only the author's edition.

P. Blakiston, Son & Co. have nearly ready 'A Handbook of Local Therapeutics,' by many competent hands.

An 'Advanced Geography,' with seven full-page relief maps, besides many others, has been prepared by Miss Eliza H. Morton for John E. Potter & Co., Philadelphia.

Griffith, Farran & Co., London, announce 'Younger American Poets, 1830–1890,' edited by Douglas Sladen, with an appendix of Younger Canadian Poets, by G. B. Roberts of St. John, N. B.

A 'History of British Guiana' has been undertaken by Mr. James Rodway, F.L.S., the librarian of the Royal Agricultural and Commercial Society of that colony. The work will be in three volumes, and will cover the period from 1668 to the present time. It will be printed and published by the *Argosy* Press, Georgetown, Demerara. Volume i., bringing the history of the colony down to the end of the last century, will be issued during the course of the present year. Mr. Rodway has also undertaken to edit for the Hakluyt Society Capt. Lawrence Kemys's account of his voyage to Guiana in 1596, for which he was "set forth" by Sir Walter Raleigh. As we have already announced, Mr. im Thurn, now Government agent of the Northwest District of British Guiana, is editing Sir Walter's 'Discoverie'; the edition published by the Hakluyt Society in 1850, and ably edited by Sir Robert Schomburgk, being now out of print.

Under the title 'West Indian Yarns by X. Beke' (alias ex-Magistrate), the same *Argosy* Press has just issued an amusing collection of stories of West Indian life. It is no secret that the author of the work is Mr. George Hammond Hawtayne, who holds a high official position in that colony. The writer being a man of much humor, with a fund of anecdote, his book is one to be read.

The late Arthur Middleton Reeves published for his second book (through Sampson Low, 1890) 'Lad and Lass,' a story of life in Iceland, which he had translated from the Icelandic of Jón Thordarson Thoroddsen—'Pittur og Stúlka,' as it is called in the original, which appeared as far back as 1850. It is still the best Icelandic work of fiction, and Mr. Reeves's translation is on the whole the most readable in any tongue, without disparagement of the excellent German version by Poestion. There have been two Danish versions, one of which was feebly rendered into English, under the title 'Sigrid,' in a New York edition. Mr. Reeves completed his translation soon after his return from Iceland, but with some diffidence and only after urging.

The Popular Edition of Sir Walter Scott's Journal just issued by the Messrs. Harper makes a single duodecimo volume of about 600 pages in fair type. The binding is a sober brown and quite presentable. Substantially

the public is as well served by this as by the more costly and elegant edition.

Students of zoölogy are under lasting obligations to Professor Lankester for bringing together in a handbook the 'Zoölogical Articles contributed to the "Encyclopædia Britannica"' (Charles Scribner's Sons). To his own essays on Protozoa, Hydrozoa, Mollusca, Polyzoa, and Vertebrata, he has added the Sponges by Sollas, the Planarians by Von Graff, the Nemertines by Hubrecht, the Rotifera by Bourne, and the Tunicata by Herdman. Each of the writers is an authority of the first rank in his special field. The longest chapters are the Mollusca, of sixty-three pages, and the Protozoa, of thirty-eight. As the articles are concise, profusely illustrated, and handsomely printed, the book is well adapted to the needs of such persons as seek a general knowledge of animal life, and it will prove a great deal more helpful to teachers than the ordinary manual of zoölogy on which so many of them depend.

Mr. Charles Bird's 'Elementary Geology' (Longmans) is an English book not adapted to use in this country. It is the printed form given to a series of lessons in geology by an English teacher, arranged to fit his own opportunities with English rocks. Whether it will be more useful to other English teachers than such books as Geikie's or Green's, is open to question. In this country there can be little need of it. Few references are made to American examples, and the most important of these are not satisfactorily illustrated. The view of the Cañon of the Colorado is from an old drawing, long superseded; the "valley showing signs of former glaciation" is an unfortunate and somewhat notorious example of the effect of exaggerating a photographic original, taken in the Rocky Mountains, although its locality is not mentioned here; and the little outline of the delta of the Mississippi is set upside down in the text. The only good that may come from the advertising of these foreign and geologically provincial books in this country is, that our own teachers may be tempted to prepare books suited to our own geological province.

It may be a matter of taste more than of judgment, but our own preference is not for books in the style of 'Through Magic Glasses,' by Arabella B. Buckley (now Mrs. Fisher), which is published by the Appletons. It is intended to give an account of the discoveries made by telescopes, microscopes, spectroscopes, and so on. Manifestly a wide range of reading has been traversed in its preparation—not shallow though wide, nor yet deep. The facts selected for description or explanation are interesting; they appear to be generally correct in statement; but heterogeneous is the very shortest word to describe their relationship, and they are artificially presented through much of the book in a series of imaginary conversations between a teacher, who calls himself a magician, and his scholars. This story part of the book with its quotation-mark style is tiresome; the direct form of statement in 'Life and Her Children,' by the same author, is preferable, and, as tested by actual home experiment, is more attractive to young people.

'Artistic Homes in City and Country, with Other Examples of Domestic Architecture,' by Albert. W. Fuller and William Arthur Wheeler, architects (Boston: Ticknor & Co.), is the fifth edition, considerably amended, of a collection of examples which are exclusively the work of its authors, and so one of a class of books which are in a way professional advertisements; and it is one of the best. Its seventy plates show a certain progress in style that is interesting, and contain exteriors and plans of all degrees of excellence, from the stateliness of plates 1–3 to the shabby-genteel of 36–38, which is perhaps one of the "other examples." American houses are, very likely—to the particular persons who live in them—what the authors here assert, the most comfortable and convenient in the world; and it is quite possible that they are the most "healthful." These specimens show more of their good qualities than do most that we see published, but they exemplify some of the bad, and in particular cling tenaciously to one of the worst, the wretched American trick of putting the water-closets in the bath-rooms.

We have already reviewed Guillemard's 'Life of Ferdinand Magellan' in the English edition. It has just been brought out for this market by Dodd, Mead & Co.

'The Portuguese on the Northeast Coast of America, and the First European Attempt at Colonization There: A Lost Chapter in American History,' is the title of a paper by the Rev. George Patterson, D.D., read before the Royal Society of Canada and printed in its transactions as well as issued separately to a small extent. It offers much evidence to show that the Portuguese were probably foremost in the sixteenth century in exploring the coasts of Labrador, Newfoundland, and Nova Scotia; that they first made known the true configuration of the Bay of Fundy and the shores of New England, and that, possibly before Cartier, they sailed up the St. Lawrence to Montreal and gave it its name. Many of the Portuguese names are still retained in these regions, and a list of them is given in an appendix. In regard to the colony sent out in 1521 from Vianna in Portugal, Dr. Patterson believes that certain traces of it have been found at St. Peter's in Cape Breton. Here are earthworks much older than those which the French built at the same place, and in one angle of them has been discovered a hooped cannon of the kind used in the sixteenth century. Several reproductions of ancient Portuguese maps illustrate the paper.

The principal article in the last number of *Petermann's Mitteilungen* is an orographic sketch of the Kapaonik Mountains, a range which forms a part of the southern boundary of Servia. In the course of it the author, Dr. W. Götz, remarks on the extraordinary sparseness of the population in this part of the country. "One can go on beaten paths," he says, "for half-a-day without meeting a human being or seeing a village, in spite of abundance of water and trees." The scientific results, especially botanical and entomological, of several Danish expeditions to the west coast of Greenland in the years 1889–1890 are given by H. Rink. It appears that the movement of one of the glaciers was seventeen feet in twenty-four hours. The map of the number shows the region explored by Maj. Wissmann and Dr. Wolf in the southeastern part of the Congo Free State, and is accompanied by cartographical remarks by Dr. B. Hassenstein.

A recent number of the London *Times* calls attention to the fact that Belgium is seeking not only to obtain a monopoly of the trade of Central Africa, but to absorb the territory also. By the Berlin Conference the northern boundary of the Congo Free State was fixed at 4° north lat. But one of its officers, Capt. Van Gele, has recently made a treaty with a powerful chief whose possessions are in 5° north lat. This movement northwards is to be supplemented by a formidable expedition, consisting of 300 soldiers and 5,000 carriers, under the command of Capt. Van Kerkhove, which left Stanley Pool early in February last, it is said, "to reach the Bahr-el-Gazelle and to annex in the King's name the Nile Valley." Over all this country, however, Egypt still retains her rights, and in order to reach it the Belgians will have to pass through territory allotted by the last Anglo-German agreement to British influence. The *Times* concludes by saying that King Leopold "ought to realize that the line of action which is being pursued by the administration of the Congo Free State will inevitably lead to its break-up and its ultimate partition among those European Powers that cluster round its borders."

A late issue of the London *Athenæum* reproduces, from a recent acquisition of the Department of MSS. in the British Museum, a letter written in Italian by the painter Rubens, on June 29, 1628, in which he confidentially communicates tidings of the discovery "ultra Tropicum versus Austrum" of "un gran paese per non dire nouum orbem," referring to Australia, the existence of which was kept secret by the Dutch East India Company.

A 'Biographical Notice of Maria Mitchell' appears as an off-print from the xxvth volume of the Transactions of the American Academy of Arts and Sciences. It is from the pen of her brother, Mr. Henry Mitchell, whose long and distinguished service in the Coast and Geodetic Survey is well known. Mr. Mitchell's scientific training stands him in good stead as a writer, manifesting itself in great lucidity and directness of style and in a restraint of eulogy which is most wise in a case where the simplest statement of facts is the most effective praise. The glimpse that one gets from his pages of the family life of the Mitchells at Nantucket is wholly charming.

The will of Mr. Barnum, most famous of showmen, proves that his public benefactions are to be extended. The amiable and philanthropic side of his character is well shown in a portrait published in July, 1889, by *Sun and Shade* (New York: Photo-Gravure Co.).

The *Classical Review* is to give much space in the next few numbers to the recently discovered treatise of Aristotle, and will welcome contributions of emendations or of notes from American scholars.

We have received from M. Édouard Rouveyre, 76 rue de Seine, Paris, six numbers of the pocket guide to present values of fine and rare books, etc., 'Petit Manuel du Bibliophile et du Libraire, donnant la valeur actuelle des livres anciens et modernes, recherchés et appréciés,' etc, edited by B. H. Gusseron. There will be twenty-four parts annually, indexed at the close by authors and titles.

The American Economic Association has awarded prizes for essays on Women Wage-earners to Miss Clare de Graffenried of Washington, D. C., and Mrs. Helen Campbell of New York. Miss Graffenried's essay will probably be published by the Association.

—John Jay, wrote the renegade minister and spy, John Vardill, to his employers, "is possessed of a strong understanding, tho much perverted by a study of the law, joined to a temper naturally controversial. You can sooner gain him to your opinion by submitting to be confuted by him, than by a direct attempt to convince him. He is obstinate, indefatigable, and dogmatical; but by his courage, zeal, and abilities as a writer and speaker, has much popularity, and leads the other delegates in Congress." That Vardill's estimate was not unfair, is proved by the contents of the second volume of the 'Correspondence and Public Papers of John Jay' (Putnams). The two long reports to Congress of his mission in Spain, and his first report from Paris, occupy one-half of

the volume, and are known through the Sparks edition, which Prof. Johnston has closely followed. They paint a dreary picture of the incidents of a hopeless mission. Misled by the too sanguine Arthur Lee, Congress blundered into constituting a mission that was distasteful to the Spanish Government, and, by giving no opportunity for an expression of opinion, forced that Government to neutralize the error by methods that savored strongly of trickery. Jay was heavily handicapped from the first. He was a beggar for money and supplies, and these were grudgingly promised and doled out with exasperating and insulting conditions; and yet he was expected to secure what Spain was determined never to part with —the navigation rights of the Mississippi. Under these circumstances, to threaten was out of the question; to assert positively, was dangerous; and Jay had no resource but to dance attendance upon a minister who was everything but frank and open in his dealings, and whose politically sensitive health (and his secretary was similarly affected) forbade him to touch upon the American business. Wearied with delay, and keenly feeling the humiliating absurdity of his position, Jay welcomed his summons to Paris, and carried with him suspicions of bad faith on the part of both France and Spain which exerted great influence in the peace negotiations.

— As in the first, the absence of notes by the editor is the conspicuous feature of this second volume, yet even to one familiar with the history of this unfortunate mission the record needs further illustration. This could be given without touching the hotly disputed question of Jay's real weight in the ultimate negotiations for peace. In only a single instance has the editor used the opening offered, and he has then inserted what we suggested properly belonged in the first volume. The correspondence of the French and Spanish Governments would have supplied a curious commentary of the text. There are many new letters from Jay, but only one (to Egbert Benson) of importance. Letters from Benson, Livingston, and Morris, and a few more letters from Mrs. Jay and Kitty Livingston, form the positive contributions of interest and value. The sombre tone of the letters is rarely lighted up with so much as a pretence to humor. Margaret Livingston boasts that she was able to raise some melons "by ye meer dint of watching every morning to kill the buggs"; and Mrs. Izard confesses that late suppers are not good for her. Even Jay slyly remarks that the French Ambassador appeared fatigued and worn down by business, looking "as I have seen some members of Congress look after two years' attendance." The proof-reading is not so accurate as it might be, and errors are frequent. The printing of Thompson, as Secretary of Congress, is inexcusable, and the use of the dollar sign ($) is an anachronism, for it did not come into use till after the Revolution.

—In his 'Life of Washington,' written for the "American Statesmen" series, Mr. Henry Cabot Lodge infers that Washington was, at the time of his appointment to negotiate with the French Governor with respect to the encroachments upon British rights on the Ohio, of good reputation. A correspondent who has lately been delving among the state papers preserved in the Record Office, London, writes as follows:

"Mr. Lodge says: 'He was a young man for such an undertaking, not yet twenty-two, but clearly of good reputation' (vol. i, p. 64). Mr. Lodge will be glad to know that Washington's reputation, even at that time, was, in fact, one of distinction. Writing to the Lords of Trade on the 17th of November, 1753, Gov. Dinwiddie said: 'I have sent out a gentleman of distinction to the French camp, on the Ohio, with my letter to the Commanding Officer, to know the reasons and by what authority he invades His Majesty of Great Britain's territories, in the time of a solid peace subsisting between the two Crowns.' In another despatch of the same date, the same Governor writes: 'I have commissioned Mr. Washington, a Major and one of the Adjutants of the Militia of this Dominion, to proceed to the French camp,' etc., etc. (See the papers in the Public Record Office, London, *America and West Indies, Colonial Office*, 667, *Virginia*, 1750 to 1780.) A copy of Washington's journal of his mission is preserved in the same bundle of documents. It was with reference to his proceedings on that occasion that he wrote to Gov. Dinwiddie on the 25th of April, 1754: 'I hope my proceedings in these affairs will be satisfactory to your honour, as I have to the utmost of my knowledge consulted the Interest of the Expedition and good of my Country, whose Rights, while they are asserted in so just a cause, I will defend to the last remains of Life.' This last utterance became the Father of his Country. May one suggest to those in search of fresh information as to Washington's early history, that facts might possibly be gleaned from the official papers in the Record Office, and especially from the despatches of those under whom Washington served?"

—The letter H fills still another volume, the twenty-sixth, of the 'Dictionary of National Biography' (Macmillan). It has already required two and a fraction, and it is not yet out of the third vowel. The Royal Henrys of England and Scotland, beginning with Henry II., take up a quarter of the volume; the Herberts 69 pages, the Hills 42. The longest article (11 pages) is devoted to Bothwell (James Hepburn), without disturbing the common reputation of the man. So Mr. Lee identifies Pembroke with the "W. H.," begetter of Shakspere's Sonnets, and Mary Fitton with the "dark woman." So Rowland Hill is credited with the invention of penny postage, though the son of a rival claimant is stirring up the press to transfer the honor. The influence of relatively obscure lives is shown in the case of Prof. Henslow, who was the scientific sponsor of Darwin, and secured him the post on the *Beagle* which determined his life-work. The endeavor of the Dictionary to keep up to date (though not obliged to this course by its original scheme) is shown in the case of the Earl of Carnarvon, who died last year. Henry William Herbert ("Frank Forester") is a connecting link between the two English-speaking nations separated by the Atlantic. A list of his more important works accompanies the sketch of his life. Sir Francis Hincks is another American figure. Sir James Hillyar commanded the *Phœbe* in the waters of Valparaiso when, in 1814, he fought the *Essex* under Porter. He was then only a captain, but he died rear-admiral, as Farragut, midshipman on the *Essex*, died admiral, first of the grade in our American navy.

—The question of the authenticity of the Talleyrand Memoirs, which was raised by M. Aulard in the *Revue Bleue*, and, upon other grounds, by M. Henri Welschinger in the *Monde*, has drawn from the Duc de Broglie a brief, smooth, almost evasive note, which appears in the *Revue Bleue* of March 28. The Duke says that he has already answered M. Aulard's question in the preface to the Memoirs; that the published text is the only one left by M. de Bacourt; that its exactness has been certified by the persons to whom Talleyrand bequeathed all his papers; that the scrupulous delicacy of M. de Bacourt has never been put in doubt; and, lastly, that as soon as the publication of the Memoirs is complete, the text from which they are printed shall be put in some public depository for everybody to see. Upon this, M. Aulard returns to the charge with fresh vigor. M. de Broglie has answered but one of his questions, he says, and that indirectly—though the question is a most important one. He does admit, though he plays a little with the word "text," that he has not the original Memoirs of Talleyrand, but only a copy of them. No shadow of suspicion rests upon the honor of the Duke, but the duties and responsibilities of the editor of a "text" sit but lightly upon his shoulders. As to M. de Bacourt, M. Aulard smites him hip and thigh, recounting the truly piteous, as well as pitiful, story of the mutilation and betrayal of Mirabeau in Bacourt's edition of the correspondence between Mirabeau and Lamarck. Just as he constructed a conservative and anti-revolutionary Mirabeau, so now he may have felt it his duty to cut out of Talleyrand's Memoirs everything that showed him to have been a friend of the Revolution, and to supply instead some stupid interpolations—a piece of trickery easy to be seen by everybody except the man who should have been the first to see it, the Duc de Broglie himself. And M. Aulard ends by asking the Duke, not whether the original manuscript is in his possession, since obviously it is not, but whether he has himself collated the copy from which he prints with the original, and assured himself of its exactness. Until this question is answered, M. Aulard says, it will be proper not so much to call in question the authenticity of the Memoirs as to affirm certainly that they are not authentic.

—Soon after his note to the *Revue Bleue* was written, the Duc de Broglie sent a communication to the *Moniteur*, in which he says that the will of M. de Bacourt mentions only the copy of the Memoirs, and says nothing of the original manuscript. On the other hand, we have, in the *Paris*, an interview with the Comtesse de Martel, a grandniece of Bacourt's, who is better known, perhaps, to most readers as "Gyp." She says she well remembers the Talleyrand manuscripts, and her uncle's extreme care of them. They were contained in three large chests, and she saw them taken away by MM. Andral and Chatelain after her uncle's death, together with "quatre livres, *reliés en peau*," her uncle's copy. She believes the published Memoirs not to be authentic, from her memory of the originals, or complete, since her uncle told her there would be fifteen volumes of them. Her suspicions point to M. Andral as the mutilator of the manuscript. In much that she says she is corroborated by the testimony of her sister, Mme. de Mirabeau, and of her cousin, M. H. de Bacourt.

—In Senator Stefano Jacini, who died on March 25, Italy has lost one of her ablest and most disinterested patriots at a moment when she can ill afford to do so. Jacini was born in 1827 in Casalbuttano, in the province of Cremona. His first work, entitled 'La Proprietà Fondiaria e le Popolazioni Agricole in Lombardia,' won the first prize given by the Society for the Encouragement of Science and Letters in Milan, and he was appointed member of the Lombard Institute of Science in Milan. When the scarcity of crops almost produced a famine in Lombardy, the Archduke Maximilian begged him to study the question, and he then wrote "a genuine indictment of Austrian rule in Italy," 'The Economic Conditions of the

Valtellina,' which was translated into English, and, though it brought him much censure for having anything to do with the hated *Straniero*, in reality did as much as more noisy patriots to secure his downfall. After the Crimean War, Cavour begged Jacini to draw up a report on the position of the Austrian Government in Venetian Lombardy, and this report was translated into various languages and served Cavour at the Paris Congress. After Cavour's death Jacini was made Minister of Public Works, and to his initiative and extraordinary persistence Italy owes the St. Gothard Railway, on the completion of which he was created Count. The war of 1866 was for him, as for many, a complete disillusion. He refused to return to Parliament, and wrote his famous pamphlet, 'Sulle condizioni della cosa pubblica in Italia dopo il 1870.' He was, above all, an enemy of centralization, seeing the necessity of national unity, but maintaining that the different provinces would be far better under a sort of federated government. He maintained that this system would be more economical, that it would develop latent and local talent, and that it would be found impossible long to govern the nation from the congested Parliament, first in Florence, then in Rome. Jacini would have had much more weight and influence in Lombardy and the rest of Italy had he not been such a stanch opponent of the transfer of the capital to Rome. On this point, Dante himself, could he return, would not be listened to. When the Liberal Government set on foot the inquiry into the conditions of the rural classes, Jacini was Chairman. His enormous wealth and life spent in these studies made him most competent for that post, and even to-day his writings on this subject would be well worth publishing not only in Italy, but in all countries where the agricultural classes form part of the social problem. Indeed, his writings published altogether will form a valuable addition to the history of the Italian *Risorgimento*.

—Astronomical bibliography has received a marked addition in the recent publication, by Dr. Ralph Copeland, Astronomer Royal for Scotland, of the Catalogue of the Crawford Library of the Royal Observatory, Edinburgh. James Ludovic, the Earl of Crawford, began the collection of the library nearly twenty years ago for his private observatory at Dun Echt, near Aberdeen; the nucleus being the library of the late Charles Babbage. Life insurance and annuities are thus very fully represented, as subjects in which Babbage was greatly interested. Also, the collection is very rich in transactions and proceedings of the learned academies, and in materials for the literary history of the exact sciences; and in particular was no occasion lost of securing essays or tracts on comets. In this department of astronomical literature the Crawford Library is among the fullest in existence. It contains, further, a number of very rare works transferred from the Library at Haigh Hall, Lancashire, and the whole was presented to the Royal Observatory, Edinburgh, by the Earl of Crawford in 1888. Among American astronomers, those whose works are represented by the largest number of entries are Pickering (30), Young (19), Newcomb and Langley (17 each), Loomis (16), H. Draper and Holden (15 each), Todd (13), and G. P. Bond, Gould, and W. A. Rogers (8 each). The Catalogue is a large quarto of 500 pages magnificently printed by Milne and Hutchison of Aberdeen, and published at Edinburgh by authority of H. M. Government. It cannot fail to prove useful to students of astronomy and kindred sciences in consulting the extensive literatures of these subjects.

RECENT POETRY.

One may look in vain in Mr. Aldrich's new volume, 'The Sisters' Tragedy' (Houghton, Mifflin & Co.), for anything that really rivals the same author's "Fredericksburg," one of the few poems which our great civil war bequeathed to literature. Nevertheless, the new volume belongs to that epoch of greater maturity which is so marked in this poet. He has had the rare happiness of outliving his early fame—as a dainty secondary poet, a Leigh Hunt, a writer of debonair verse—and of rising to the rank of a true artist, who commands his own power and neither belittles it nor is overcome by it. Among the London parlor poets, for instance, there is no one except Austin Dobson, and he only in his "Once at the Angelus," who is to be compared with Aldrich. When he touches love at its lightest, it is with a cadence that makes it immortal:

> "Pillared arch and sculptured tower
> Of Ilium have had their hour;
> The dust of many a king is blown
> On the wind, from zone to zone;
> Many a warrior sleeps unknown.
> Time and Death hold each in thrall,
> Yet is love the lord of all;
> Still does Helen's beauty stir,
> Because a poet sang of her." (P. 53.)

And when, on the other hand, he makes the same passion the theme of tragedy, he condenses into a few pages a drama like that of "Paulina Paulovna," which recalls by its strength the first indication of Aldrich's dramatic power given in his brief play "Mercedes," published some years ago. The title-poem of the present volume seems a shade less powerful, perhaps from its suggesting that wonderful delineation where Guy de Maupassant, under the name of "La Confession," handles a scene and situation similar to Mr. Aldrich's, yet more tragic. But it is only a difference of degree, not of kind; the skill is there.

We would gladly find in 'The Lion's Cub, and Other Poems,' by Richard Henry Stoddard (Scribners), evidence of a like maturity of growth, but it suggests rather the ashes of wayward and burnt-out fires. The same is true, and painfully true, of "Joaquin" Miller, who in his 'In Classic Shades' (Chicago: Belford-Clarke Co.), essays to keep up his jaunty air, and to jingle the old bells, but they have ceased to charm, if they ever charmed; and his autobiographic interludes only make the case sadder. With that pervadingly bad taste which always belonged to him, he has chosen for his title-poem one of the very cheapest bits of doggerel in the volume; and the reader is only propitiated by the fact that he dedicates the whole book to his little girl as his "most indulgent critic."

On the whole, we prefer our sophisticated but untamed "Joaquin" to Mr. Rudyard Kipling, whose poems have certainly some ring and animation, but have, even more than his prose, that garlic flavor which makes a very little of them go a great way, and makes the reader himself soon wish to go a great way off. Mr. Kipling's volume is called 'Departmental Ditties, Barrack-Room Ballads, and Other Verses' (U. S. Book Co.), and the strongest poem in it, unquestionably, is a rhyme of the Indian Civil Service from the point of view of "The Galley Slave." The genuine quality of English manhood comes out in this picture of the possible swamping of the nation's galley in some future tempest and of the fidelity of her crew:

> "She will need no half-mast signal, minute-gun, or rocket-flare:
> When the cry for help goes seaward, she will find her servants there.
> Battered chain-gangs of the orlop, grizzled drafts of years gone by,
> To the bench that broke their manhood, they shall lash themselves and die.
>
> "Hale and crippled, young and aged, paid, deserted, shipped away—
> Palace, cot, and lazaretto shall make up the tale that day,
> When the skies are black above them, and the decks ablaze beneath,
> And the top-men clear the raffle with their clasp-knives in their teeth." (P. 251.)

That is strong writing; yet he would be a bold man who should predict any serious literary future for Mr. Kipling. Mere strength is not enough. "Où il n'y a point de délicatesse, il n'y a point de littérature."

Sir Edwin Arnold's 'Light of the World' (Funk & Wagnalls) will be read by thousands in the perennial hope—thus far always disappointed—that the Scripture narratives can be made available for the uses of lofty song. Up to this time no one has succeeded in awakening other than unfavorable comparisons with the simple beauty of the original records. Joined with this obstacle to success has been unquestionably that fault of excessive rapidity of composition which this poet's injudicious friends have ere now claimed as a merit. Whole pages of the volume read as if written during a sleepless night, or as a task before breakfast, and as fast as the pen could go; nor are there any passages so salient or so haunting as to break the level in any conspicuous way. The only personality that is presented with any marked strength is that of Mary Magdalen; and the introduction of the Eastern Buddhist takes from the simplicity of the whole, without increasing its power. Mr. Stoddard prefaces the volume with an introduction, but it is not easy to see why, since Sir Edwin Arnold had already ten American readers where Mr. Stoddard had one; and this preliminary work appears wholly perfunctory and adds nothing of value.

Of recent English poems, Mr. Alfred Austin is printing a revised edition of his collective works (Macmillan), and sends forth new issues of 'The Tower of Babel,' 'Prince Lucifer,' and 'Savonarola.' With the utmost labor, he still fails to reach the human heart, or at least—what he, perhaps, would regard as a somewhat different thing—the American heart. There is no contemporary poet about whom the estimates of the two English-speaking races are so far apart. This we should be inclined to regret but for the extraordinary want of moral courage which has led him to withdraw from the new edition of 'Savonarola' the original preface—far stronger and more valuable than anything in the poem itself—in which he pointed out the curious analogies between the career of his hero and the narratives of the New Testament. This was written in no spirit of irreverence, but perhaps the offence was in doing it at all; for in this edition the whole thing vanishes, and a tame inscription to Henry Irving takes its place.

Mr. Stevenson, in his 'Ballads' (Scribners), shows the weakness, which he has before made apparent, of having no fixed standard of his own, but one easily modified by the influence of lesser men. These bloodthirsty and repulsive ballads of the Southern Seas are what Kipling and Haggard would doubtless call "manly"; but to our thinking the only really manly thing in the book is the "Christmas at Sea," on the very last pages. Mme. Darmesteter, who, as Miss Robinson, wrote poems of much dainty skill and of a sickly charm, has neither lost in art nor gained in healthfulness with marriage. The volume called 'Lyrics,' selected from her works (Stokes Company), has

a little new matter, but contains mostly what has appeared before. 'Poems, Ballads, and Bucolics,' by H. D. Rawnsley, M.A. (Macmillan), is the title of a simple, sincere, and animated collection, mostly of poems on deeds of heroism, both in England and America. It is dedicated to Phillips Brooks, "with gratitude for all he has done for the religious thought of England," and also "to those Americans who remember that their forefathers sailed from Lincolnshire." Many of the poems are in the strong and racy Lincolnshire dialect, already made familiar by Tennyson. It is curious that so few traces of this dialect should survive in any part of America.

In Mr. F. Leyton's 'Shadows of the Lake' (London: Kegan Paul), and Mr. John Arthur Blaikie's 'Love's Victory' (London: Percival), we have the work of cultivated and poetic minds, rather than of poets, although the latter's monody on Thomas Chatterton is perhaps the best tribute yet paid to that pathetic memory. Mr. A. H. Bullen closes his valuable studies of Elizabethan literature with the 'Poetical Rhapsody' of Francis Davison (London: George Bell). It is the least attractive of his volumes; the really striking poems which it contains have long since been embraced in the anthologies, and the rest belongs rather to the history of poetry than to poetry itself. The same may be said of Mr. C. L. Kingsford's admirably thorough and satisfactory edition of 'The Song of Lewes,' that invaluable though scarcely poetic Latin epic of the "Barons' War" in the thirteenth century (Oxford: Clarendon Press; New York: Macmillan). 'Poems by V.' (Mrs. Archer Clive) (London: Longmans) were first published half a century ago, and were praised in the *Quarterly Review* in their day. Since then their author has achieved a wider reputation by her remarkable novel 'Paul Ferroll'; and now, since her death, the original volume is reprinted with a few additions. It is full of cultivated thought and of gracious, womanly character. 'Women Poets of the Victorian Era,' edited by Mrs. William Sharp (London: Scott), is a thorough remoulding of the same editor's work, entitled 'Women's Voices,' in a previous series. It has a new and somewhat more elaborate preface, including, however, passages from her former introduction. The work is confined to English poets, as it should be, and is fairly well done, with some valuable biographical details at the end. It is a pity that the reader should open, at the very first page, on a misprint reproduced from the same editor's earlier volume, in Harriet Martineau's fine verses called "Onward." In the couplet

> "As cave-drops swell the streams
> Day-thoughts feed nightly dreams,"

the whole antithesis is lost by substituting "mighty" for "nightly." But we may well thank Mrs. Sharp for giving to the reader, in a form so cheap and compact—for the book appears in the "Canterbury Poets" series—so many good things, one of the best of which is Isa Craig-Knox's fine ballad, "The Brides of Quair." In ballad-making, at least, our English and Scotch sisters have an advantage over their American kinsfolk.

It is a curious coincidence that just as Mr. Cable brought into use the rich coloring of the French Creole regions of the South, the Canadian poets began timidly to use the same resources among the Frenchmen of Canada; and the best fruit of the new effort is to be found in 'Pine Rose and Fleur de Lis' (Toronto: Hart), by S. Frances Harrison, first known as "Serrano," and author of 'Crowded Out, and Other Sketches,' based on Canadian life. The pretty French phrases and refrains come like the notes of a guitar into our Saxon symphony. One of the most effective of these poems is addressed to Maurice Thompson, and takes up the refrain of his appeal to England to "call him home." It would appear from this address that the author has never herself been in England; yet some of the pages are filled with that curious feeling called loyalty to a queen. Less semi-exotic in allusion, though coming under an author's name that seems exotic enough, is 'Rose-Brake Poems,' by Danske Dandridge (New York: Putnams). These poems have a flavor of the woods of Virginia, and show some personal power besides. Miss Isabella T. Aitkin entitles her volume 'Bohemia, and Other Poems' (Philadelphia: Lippincott), but most of the verses seem rather to have been written in a morgue or a dissecting-room, so incessant and prosaic is the delineation of fleshly horrors and tortures. One of the leading poems is called "A Day's Diary in the Infernal Regions." It is to be said to her credit, however, that she has omitted the demon of lust, who rages irrepressibly through the utterly repulsive volume called 'The Witch of En-dor, and Other Poems,' by the late Francis S. Saltus (Buffalo: Moulton). Oh, Charles Baudelaire, for how much hast thou to answer, both in thyself and through thy cheaper imitators! They all recall Joubert's verdict on Parny, "Des blasphèmes mielleux, ou plutôt des ordures vernissées, d'où le blasphème découle avec douceur, comme un miel empoisonné."

There lie before us many recent volumes of American verse. Of most of them it can only be said that the best thing to be gleaned from them is some bit of local coloring, which may justify the existence of the particular page where it occurs. Thus Mr. Isaac R. Pennypacker gives us, in his 'Gettysburg, and Other Poems' (Philadelphia: Coates), a touch that no one else has previously given, on the passing of the wild geese at night:

> "Then stood we shivering in the night-air cold,
> And heard a sound as if a chariot rolled
> Groaning adown the heavens; and lo! o'erhead,
> Twice, thrice the wild-geese cried, then on they sped,
> O'er field and wood and bay, toward Southern seas;
> So low they flew that on the forest trees
> Their strong wind splashed a spray of moonlight white;
> So straight they flew, so fast their steady flight.
> True as an arrow they sailed down the night;
> Like lights blown out they vanished from the sight."
> (P. 66.)

Here is something worth writing: no matter whether it be great or small, it gives us something that we otherwise should not have had; and even the mere indication of a poetic theme, without the actual treatment, may do this, as when Mr. Charles Lemuel Thompson, in his 'Etchings in Verse' (Randolph), gives a poem on "The House-Top Walk" (p. 65)—the platform on the roof of some old Nantucket house, from which the sailors' wives and daughters looked out for the ships. He here offers us a text so novel and striking that we hardly care whether his subsequent sermon be good or poor. So in 'Arcade Echoes' (Philadelphia: Lippincott), a small volume of poems selected from the *Virginia University Magazine*, we should know by the very themes and the love-making that we were near the Potomac. Capt. E. L. Huggins, U. S. A., at least gives us 'Winona, a Dakota Legend, and Other Poems' (Putnams), though his heart is evidently more in his French and Spanish translations than in the Indian lore. James Whitcomb Riley's 'Rhymes of Childhood' (Indianapolis: Bowen-Merrill Co.) is, of course, mainly pervaded by local coloring, modified also by the land of childhood; and his "Raggedy Man" seems somehow, one can hardly tell why, to have struck a chord in the national consciousness. But when Mr. Norman de Lagutry—if that be the real name—issues a volume called 'Love Conquereth' (Sewanee, Tenn.: O. T. Porcher), and inscribes it briefly "To My Sewanee," who can help seeing that he would have honored his Sewanee more effectually by a single tint of local color, a single trait which belonged appropriately there and nowhere else, than by any three words of mere sentiment? It is not that this is the only thing to be done, but for one who is beginning his career it is one of the best things. Just above one's own door, wherever it may be, lies the star to which Emerson advises every man to hitch his wagon.

MADISON'S SECOND ADMINISTRATION.—I.

History of the United States of America during the Second Administration of James Madison By Henry Adams. 3 vols. Charles Scribner's Sons. 1891.

In these three volumes devoted specifically to the second term of Madison's Administration, and forming the seventh, eighth, and ninth volumes of a continuous series, Mr. Adams brings to a close his copious and critical history of the sixteen years covered by the dynasty of Jefferson and his successor. The narrative before us relates almost exclusively to a period of war, when the annals of a country, however tedious they may have been in the piping times of peace, are expected to quicken with enthusiasm and emotion, because they ought to be full of impassioned feeling raised to the height of great endeavors in policy and in arms. Yet in spite of the fact, remarked by the greatest of the historians of Greece, that war is apt to assimilate the passions of men to the condition in which it places them, Mr. Adams finds it no easy task to kindle his own enthusiasm or the enthusiasm of his readers by a detailed recital of either the political or the military history of our war with England from 1812 to 1815. It is only in the description of a few brilliant battles like those of Lundy's Lane, of Chippawa, and of New Orleans; or in the circumstantial account of the two naval victories plucked from the jaws of defeat on the Lakes by the superior intelligence of Perry and Macdonough; or in the vivid picture of a few naval duels which, as fought on the high seas, came to demonstrate the superiority of American skill in gunnery and seamanship, that this story quickens with the fire and vivacity of picturesque narration. It is not that Mr. Adams does not make a careful study of the battles he describes—they are described with extraordinary minuteness and precision—but that most of the battles themselves, for the want of military genius and strategic sagacity on both sides, seem too often to be hardly worth the critical pains bestowed on them. It is not that the battles here portrayed were petty and inconsequential skirmishes compared with the Titanic encounters which shook the continent and fixed the gaze of the civilized world during our civil war, but that the war itself was fought with much languor by a divided people, and was conducted with much impuissance by a Government which for long years had proclaimed that "peace was its passion," and which had taught the lesson of peace so well that it found much difficulty in attempting to indoctrinate the people with either the necessity or the expediency of war. With nearly equal grounds of complaint against England and France, the country had so long recoiled from the impossibility of coping with both, that it came in the end to look with fear

and trembling on the necessity of fighting either. It is no surprise that this state of irresolution was not ended by a declaration of war, and that it spread its influence through the military operations of the war itself; for the vote of Congress, in the very act of declaring the war, had revealed a precise inversion of economic interests and of political convictions on the part alike of those who favored the war and of those who opposed it. The war was professedly waged in defence of "free trade and sailors' rights," but the Southern States, which favored the war, had neither commerce nor seamen. The Eastern States had both, but for this very reason they opposed the war, as being more a hindrance than a help to their prosperity.

This state of turmoil and of vacillation was betrayed as well by the civil as by the military conduct of the Administration. In the very heart of the war, the Administration came before Congress with a virtual confession that the physical forces of the nation were not equal to the occasion, and that the surest signal of public safety was to be found not in the sword but in the shield. An embargo policy was again openly avowed (after all the discomfitures it had brought on Jefferson), as the best available instrument of self-defence and of foreign coercion. The efficacy of an embargo, as an instrument of defence, had for years been deeply imbedded in the minds of Southern politicians, and the roots of the same idea, as Mr. Adams pertinently observes, were not wholly eradicated from the Southern mind down to so late a period as the advent of our civil war, when Southern statesmen flattered themselves with the belief that an embargo put on "King Cotton" would lead to a forcible intervention of the European nations to put an end to any war which deprived them of a staple indispensable to their economy. The Southern statesmen of 1813 believed in like manner that a self-imposed embargo would produce a like coercive effect in the interest of peace between England and the United States —for how could England subsist without agricultural products?

The Embargo Act was passed on the 17th of December, 1813. But hardly had the measure been extorted from a reluctant Congress when news reached America of the great battles fought at Leipzig. The meteoric star of Napoleon was visibly waning. The whole European continent, except France, was again open to British commerce, and the Federalists of New England were quick to seize the opportunity which the embargo offered for making the war doubly odious in a political and in an economical sense—in a political sense because it made the United States appear thereafter as the impotent and single-handed ally of Napoleon, and in an economical sense because American ships were left thereafter to rot in their docks, without the poor pretence which in the beginning had lain at the root of this "terrapin policy," as it was contemptuously called in the political dialect of the times. What the Administration had mistakenly devised as a shield, now came to place a sword in the hands of its political adversaries.

For the desperate condition to which the country was reduced at the nadir of its depression during the war, Mr. Adams holds that the Federalists of the New England States were mainly responsible. Notwithstanding the fact that nearly one-half of the people in the five New England States gave a loyal support to the war, they were politically paralyzed by the other and majority portion which opposed the war. Among those who opposed the war, one-half, he thinks, wished to stop it by some peremptory and independent action of the States, but were held in check by the other half, which threatened to desert their leaders at the first overt act of treason. It is easy to see how this divided state of opinion in New England tended to paralyze action in all directions without accelerating it in any. The anti-war party obstructed positive and efficient measures looking to a vigorous prosecution of the war. The schism in the bosom of the anti-war party itself obstructed positive and efficient measures looking to the forcible suspension of the war. Procrastination and indecision ruled the hour at all points.

In this attitude it was that the Republicans were compelled to put their best hope in the *vis inertiæ* of our democratic institutions, and that the Federalists, in their contempt for democracy, were compelled to wait in hope that the Administration would perish from the political gangrene lodged in its vitals, and would not need to be overthrown by a violent concussion. Mr. Adams thinks that at one time the Federalists of that day had good reason to believe that, what with their own obstinacy, the obstinacy of England, and the obstinacy of Madison, the conjuncture might come when the national Government would have to cease its functions, and when the New England States would be left free to resume their sovereign powers. Allying their political hopes with what they believed would prove the adverse fortunes of the war, the Federalists of the Pickering school could not suppose that England, after she had broken the power of the French autocrat, would consent to any peace which should not involve the overthrow of Madison and his party. Intimations to this effect were frequent in the London press, and ardent Federalists, not only in New England but also in New York, Maryland, and elsewhere, seized on these intimations as prefiguring the end of the desolations wrought by democracy in Europe and America. Gouverneur Morris, in an oration delivered in New York city to celebrate the overthrow of Napoleon, employed all his powers of melodramatic eloquence to portray in Napoleon a typical representative of the same French democracy which had killed "our beloved ally," Louis XVI., and deluged Paris with the blood of the French Revolution. He rejoiced to think that "the long agony of democracy was over." Hanson of Maryland, the extreme Federalist "who had been mobbed and nearly killed in Baltimore in June, 1812, only to be elected to Congress in [the following] November," was free to express the opinion in 1813 that "a few hard blows struck [by the enemy] in the right place would be of great service to the country" by putting an end to the domination of Madison.

Yet at the very time when Massachusetts, Vermont, and Connecticut were showing in their organic capacity (because of the Federalist preponderance) such a marked dissatisfaction with the Federal Government, the martial spirit of New England, though recruited only from that half of her population which was politically crippled by the other half, continued to maintain its ancient renown "in the serious work of fighting," as Mr. Adams phrases it. In evidence of the fact that New England, with her hands politically tied behind her back, might still justly claim her full share of credit in the "glories" of the war, such as they were, the author cites the fact that it was not Virginia, Kentucky, or Tennessee regiments, but regiments from Vermont, Massachusetts, and Connecticut, "which routed the Royal Scots at Chippawa, and bayoneted the British artillerymen at Lundy's Lane, and stormed Drummond's intrenchments at Fort Erie."

Intense Federalists, while mocking at the military incapacity of the Administration, did not hesitate to lament the weakness with which the war was conducted by England, as offering less prospect than could have been wished that the British Ministry would be able to conquer a favorable peace. Hanson of Maryland wrote to Pickering towards the close of the year 1813, that "the war by its own generative powers" might come to create the means for its support if the British Government did not quicken its military pace. He specially feared that the vanity of the American people was in danger of being elated by "these brilliant naval victories." Mr. Adams caustically observes that the vanity of a people that could be flattered by such "glories" as the war gave in 1813, "must have felt the want of flattery to an unusual degree." He thinks it was not so much the "glories" as the "disgraces" of the war that roused public sympathy in support of the Government, and that the Federalist opposition was quelled, not so much by the demonstrated vigor of the Administration, as by "the slow conviction of the people that, come what would, the nation must be preserved." The political situation in the autumn of 1814, when A. J. Dallas was called to succeed Gallatin in the Treasury Department, is thus described:

"Earnest in temper and emphatic in tone even to the point of tears and tropical excitability, Dallas came to Washington as though to lead a forlorn hope—caring little for parties and less for ambition, but bent upon restoring to the Government the powers that his friend Gallatin, too easily as he thought, had allowed to slip from its grasp. The difficulties of the Treasury when Dallas took charge of it were not easily exaggerated. His own description, given some six weeks afterwards, made no disguise of them. 'The Treasury,' he said, 'was suffering under every kind of embarrassment. The demands upon it were great in amount, while the means to satisfy them were comparatively small, precarious in collection, and difficult in their application. . . . The means consisted (1) of the fragment of an authority to borrow money when nobody was disposed to lend, and to issue Treasury notes which none but necessitous creditors or contractors in distress . . . seemed willing to accept; (2) of bank credits, chiefly in the South and West, rendered largely useless by the suspension of specie payments; (3) of the current receipts of taxes, also useless because paid chiefly in Treasury notes. The Treasury was bankrupt. The formal stoppage of payments in interest on the debt was announced, November 9, by an official letter from the Secretary, notifying holders of Government securities in Boston that the Treasury could not meet its obligations, and that the Government was unable to avert or to control this course of events! After that date the Treasury made no further pretence of solvency."

Woman's Work in America. Edited by Annie Nathan Meyer, with an introduction by Julia Ward Howe. Henry Holt & Co. 1891. Pp. vi., 457.

THIS book is composed of a series of essays by different authors, undertaking to give an account of what has been done by women in the departments of education, literature, journalism, medicine, the ministry, law, the State, industry, and philanthropy. The last head is divided into charity, the care of the sick, the criminal, the Indian, anti-slavery, the W. C. T. U., and the "Red Cross." We have nine topics, but from the fact that education is treated in three separate essays, dealing respectively with the East, the West, and the South, eighteen essays. The editor states that only those branches of woman's multifarious work have been selected for headings

"which have been denied her," and therefore it is surprising to find the "care of the sick," literature, and industry among the list. It may be asked why trade is not one of the lines in which she has appeared, and we should like also to know about the women who have given their time to art, in any of its forms. The book is closely printed, and as there are more than 400 words on a page, it will be apparent that it contains a great deal of reading.

It were much to be desired that women should have all roads freely thrown open to them, if only that we might get rid of the assertive tone which is apt to mar the effect of whatever they write. When we come to the question of work for the good of the world, it is hardly worth while to stop to say whether it be done by man or woman, so only that it be done. In other words, in view of the greatness of the work, the question of sex as well as that of individuality ought to disappear. Again, it is knowledge of the appliances for work that we want, not the names of women who have been most prominent, and here we have to find grave fault with many of the essays in that they consist of nothing but names. Too often an impression that the writers are advertising themselves and each other annoys the reader anxious for the simple facts. A sample may be found at the foot of page 184, in a quarter where we should least expect it, and in the account of the W. C. T. U. it is offensively conspicuous. The classification of the book is faulty, and many of the essays necessarily run into or overlap each other; as, *e. g.*, those on the care of the sick and on medicine, those on industry and charity. It was the chief function of the editor to prevent this, and to give the book to a busy public with the unity which every volume should have.

It must also be said, though unwillingly, that the English of the book as a whole is not only diffuse and weak, but sometimes positively ungrammatical. The punctuation is so careless that it is often quite impossible to understand the meaning of a sentence without many attempts, and the proof-reading is inexcusably careless. On page 47, for instance, the retiring President of Wellesley is spoken of as "Miss Palmer." It is much to be regretted that so strong a personal tone should run through the preface and that careless writing should permit there such a sentence as this: "It is considered highly supererogatory that a woman should be taught to stand upon her own feet when the adjacent shoulder answers the purpose as well." And we are at a loss as to what may be referred to by the expression, also in the preface, "the awful statistics of unmarried women in the United States." The introduction is very short, only a page and a half, and is too full of words to be quite clear. A sentence from it, "All this belongs to the record of things which, once measurably true, have became fabulous," will perhaps show what we mean when we say that it lacks clearness. It is a pity that a book which aims at showing that women are entitled to more influence than has heretofore been accorded them, should try to establish this claim in poor English.

What was to be said of education should have been compressed into one article, and not spread out into three, containing many irrelevant facts. If the great public schools of England are to be spoken of, it is not well to give the impression that Rugby was the last established. There is too little said of normal schools and of their influence, and a trifle too much of Barnard College, which yet cannot be said to have any, though it is placed before Vassar in the record. We are not told, as we might have been, that what was the first normal school in the country has had a woman at its head now for many years, and nothing is said of the two women who in that place have done so much for the teachers of Massachusetts. Neither is any mention made of the fact that the first woman in the world to be Principal of a normal school (that of St. Louis, Mo.) was a graduate of this same school, from which also the overlooked large school of Miss Kelly in Charleston, S. C., draws its inspiration indirectly. The Mary Institute in St. Louis deserves mention as a department of Washington University.

The article on law is one of the most interesting in the collection, and makes good use of its twenty-six pages, no one of which can be spared. Its clearness and business-like tone may come from the fact that a woman cannot hold her place in that profession by any other means than that of ability. There is no nonsense about her work there, and if she cannot stand, she must leave. It is amusing to be told, in the account of a woman lawyer (p. 241), that "her argument was relieved of the superfluities that frequently characterize the verbose utterances of more experienced attorneys of the male sex." The plea for the necessity of women to defend their own sex under certain trying circumstances is well put and deserves attention. The essay on medicine, generally well written and arranged, is valuable as giving results accomplished in the way of hospitals, and not being a mere list of names. It is, however, marred for the general reader by Latin and technical terms which would be in place in a medical journal. The article on industry deserves more than a passing notice. To many, the account of the Lowell mills and their operatives will be new, and the story of the establishment of the various women's homes is highly valuable. The essay on charity by the well-known hand of Mrs. Lowell is well planned and carefully written, and emphasizes as it should the need of personal contact with those who need help. The record as to the care of the criminal makes use of its opportunity to enforce the need of police matrons in all cities, and does it wisely and well. The articles on the Indian and the W. C. T. U. are too much special pleading for special societies, and that on the State is only a lecture on the demand for the franchise. The essay on literature has already become known through the pages of the magazine in which it appeared this last autumn. It is a "chaos of bright phrases," and unfortunately has not as many verbs as it has sentences.

The fact that editing is a profession, and that it cannot be done with profit by any amateur who may desire to take it up, could not be more clearly demonstrated than by this book. To be an editor is to change chaos into a harmonious creation, and good intentions cannot make up for the lack of training. There is material enough here to make a really valuable book if it had been edited. As it is, the skilful work of some contributors is marred by the careless and incompetent sketches of others; there are many errors which ought not to be, there is much repetition, and the bulk of the volume might have been reduced one-half to advantage.

Racing Reminiscences and Experiences of the Turf. By Sir George Chetwynd, Bart. 2 vols. Longmans, Green & Co.

In the first of these volumes Sir George Chetwynd gives an interesting account of the principal English racing events of the years from 1869 to 1890. Half of the second volume is devoted to matters more or less connected with horseflesh, and the remainder gives *in extenso* the examination and cross-examination of the plaintiff in the celebrated libel suit of Sir George Chetwynd versus Lord Durham tried in 1889. The stewards of the Jockey Club, who sat as arbitrators in the case, decided that the plaintiff had not been guilty of the practices charged—namely, conspiring with jockeys and trainers to run horses in such a way as to deceive and plunder the public—but they filled his soul with sadness by giving him merely nominal damages instead of the much larger sum at which he seems to have estimated the injury to his reputation. On the evidence here given, the arbitrators could hardly have failed to acquit Sir George on the more serious charges; but the mere fact that he admitted having borrowed money from his own jockey during an "impecunious period," shows that the exigencies of the turf are not conducive to a delicate sense of propriety in money matters.

Of late years the increase in the amount of stakes and in the number of race-meetings, both in England and in France, has led to an enormous extension of the betting mania, with the usual demoralizing results. Any one who has spent a few weeks before the Derby in England cannot fail to be impressed with the universality of this form of gambling, and we have recently seen that the French Legislature has taken alarm, and is endeavoring to curb the evil on the other side of the Channel. Sir George is decidedly of opinion that there can be no racing without betting, and if this is so, it becomes a serious question whether the improvement of the breed of horses or any other of the stock arguments in favor of racing can be considered to have any weight as an offset to so manifest an evil. Sir George admits that the professional layers of odds are certain to win in the long run from the backers of horses, and yet he and other owners of horses seem to be satisfied to remain in the latter category at the risk of "periods of impecuniosity," and his readers may fairly apply to him the language he makes use of in regard to certain other "plungers": "No amount of publicity or warning apparently has any deterrent effect on some foolish and credulous people who, indeed, seem born to be swindled"! In this connection Sir George tells a story of a well-known bookmaker with the appropriate name of Swindell, who was asked by a friend what he should do in the case of a man who had paid him twice over for a bet of £100. "*Do*," said he; "why, look hard at him next time thee meets him, and perhaps he'll pay thee a third time!"

Turning to racing, Sir George's account of the important races of the last twenty years brings into prominence a point which the non-sporting public rarely appreciates, namely, the number of races won by the jockeys rather than the horses. He gives many instances in which the skill, shrewdness, and knowledge of the course possessed by Fordham or Cannon entirely changed the result and upset the nicest calculation. These two successful riders were singularly different in their style of riding, Fordham bending forward over the horse's neck, gripping the saddle with his knees, and holding the whip in his left hand, while Cannon sat perfectly straight in his saddle, holding the reins in his left hand and the whip in his right. The general result of Sir George's experience is that he would not recommend a young man to go on the turf, because the occasional victories do not make up for the jealousies, quarrels, and disappointments that seem

inseparable from the sport; but he thinks any man would deserve well of his country if he devoted himself to breeding race-horses. The difficulty is, that the man who breeds running-horses wants to see them run, and then wants to back them.

Among the stories with which Sir George has enlivened his narrative is a curious one about Lord Vivian's dream the night before the race for the City and Suburban in 1874. It appears that he dreamed the race was won by a horse called "The Teacher," and in the morning he looked over the entries, but could not find any horse of that name. Later on he was informed that one of the starters, a horse called "Aldrich," had formerly been called "The Teacher," but that his owner did not think he had any chance of winning the race. Nevertheless, Lord Vivian backed his dream by taking the long odds of a thousand to thirty, and the horse won by a neck. It would be interesting to know how much money has been lost by backing dreams since the year 1874.

By the omission of the trial scene and a little judicious editing, Sir George's Reminiscences might have been reduced to one volume with much advantage to his readers; but, in spite of prolixity and occasional solecisms, the book is decidedly readable.

Principles of English Etymology. By the Rev. Walter W. Skeat, Litt.D., LL.D., etc., Professor of Anglo-Saxon in the University of Cambridge. First Series: The Native Element. 1887. Second Series: The Foreign Element. 1891. Oxford: Clarendon Press; New York: Macmillan.

Prof. Skeat has been long recognized as the foremost among the University professors in England in his perception of the needs of students of English and his skill and promptness in supplying them. In his Etymological Dictionary he appears as a champion of the scientific study of etymology, a sort of prophet among the dictionary-makers of Great Britain, announcing the supremacy of law over the whole history of every letter of every English word, and denouncing all etymologists who neglect the laws. He has a broadside of this sort in his preface, and he keeps up a running fire from word to word through the whole dictionary. After that was finished, in 1881, Prof. Skeat undertook to prepare a manual of the etymological principles or laws which he found to be exemplified in the words discussed in the dictionary. In the dictionary the words which exhibit any phonetic law are scattered through the book as they happen to occur in alphabetical order. In the new manual they are brought together under the statement of the law. They can thus be studied together, and seen to throw light on each other and to establish and define the law.

In the First Series the earlier words of our language, "the native element," are taken up. These are mostly Anglo-Saxon, with a few other Low-German and some Scandinavian words, but there are also some Celtic and Latin and Greek words of the early time. In the Second Series Prof. Skeat takes up the words which have been added to English since the Norman Conquest, "the foreign element," as he calls it. The most important part of these are "Anglo-French," but he gives a chapter to Latin, to Italian, to Spanish, to Portuguese, to Greek, and seven chapters to sundries—Slavic, Persian, Sanskrit, Hebrew, Arabic, and other Asiatic languages, African languages, and various American languages.

The method used is to explain the pronunciation of the words when they were taken into English, or became known as English, and then set forth the principal phonetic changes that have taken place in them since. The First Series is thus occupied mainly with the phonetic laws of Anglo-Saxon, and the Second Series with those of Anglo-French. Grimm's law, Verner's law, the laws of vowel gradation and vowel mutation play a great part in the first volume. They are presented with careful elaboration of statement and a very complete collection of the English words which illustrate them. The best part of the work is the research, the original gathering of examples, and the accurate presentation of them. Perhaps the most interesting matter is the history of the growth of modern English spelling, and a discussion of its present condition, which occupies about a hundred pages, and gives the most complete view of it that is to be found. Like all other scientific students of our language, Prof. Skeat groans over our present alphabetical condition. He closes with the following paragraph:

"The shortest description of modern spelling is to say that, speaking generally, it represents Victorian pronunciation of 'popular' words by means of symbols imperfectly adapted to an Elizabethan pronunciation; the symbols themselves being mainly due to the Anglo-French scribes of the Plantagenet period, whose system was meant to be phonetic. It also aims at suggesting to the eye the original forms of 'learned' words. It is thus governed by two conflicting principles, neither of which, even in its own domain, is consistently carried out."

The material of the Second Series is fresher than that of the first. The Anglo-French is comparatively unknown even to specialists in English etymology and French etymology.

"I know of nothing," says Prof. Skeat, "more disgraceful to such a land as England, the lawyers of which have made more or less use of Anglo-French for some eight hundred years, than the fact that no one has yet taken in hand to make a reasonably useful dictionary, or even a vocabulary, of this highly important language." "As far as I can discover, the only person who has done any useful work in this direction is myself."

He refers to his word-lists published by the Philological Society of London, and to that of his eldest daughter, published by the English Dialect Society. As was to be expected, *Beiträge* have followed from Germany. But pretty much all the exposition of Anglo-French forms and of the changes they have undergone on the way to our present English is eminently Prof. Skeat's.

His lists contain nearly 3,400 A. F. words, and his discussions are lively throughout, and clear up numerous spellings which seem inexplicable to the mere student of modern French and college Latin. Many words are condemned: "*vitaille*, now absurdly spelt 'victual' instead of 'vittle.'" "I much regret to find that some Dictionaries mark the old word *chivalry* with *ch = sh*, which is detestable." "We find it [oblige] as [obliij] in Pope, Prol. to Satires, 208, but this was due to the influence of Continental French." One drawback is found here and there: Prof. Skeat uses Southern English pronunciation, sometimes without reference to any other. He says, for example, that the A. F. *or* followed by a consonant gives rise to two sounds, that in *attorney* and that in *cord*, *pork*, *forfeit*, *sport*, *order*, etc.; pronouncing cord *caud*, rhyming with *laud*, pork *pauk*, rhyming with *hawk*, sport *spaut*, rhyming with *taught*, etc., though this pronunciation has hardly found its way into literature or the dictionaries, and the standard pronunciation is left unexplained. On the whole, however, this is a very useful book. It has a great deal of interesting matter not easily accessible elsewhere, and not a little valuable material wholly its own.

The Prelude to Modern History. By J. P. Symes, University College, Nottingham. London: Rivingtons.

This little volume of 139 pages, 12mo, with 4 historical maps, professes to give a brief sketch of the world's history from the third to the ninth century, in fourteen chapters, representing as many lectures delivered by the author. To each chapter a summary is added, evidently to serve for cramming. The period covered is from 250 to 850 A. D.

There is no original research in the book, and no reference to authorities; nor has the author been careful in stating well-known facts correctly, and in calling countries and nations by their right, and not by misleading names. In an introductory chapter on Rome before the middle of the third century he says (p. 2): "The Romans tolerated all religions except those of the Jews and of the Druids." This is hardly true. The Jews, indeed, were misused and massacred in Palestine and Alexandria, where they struggled for independence, or at least for autonomy; but in the very city of Rome Jews have been allowed to worship in their own style from the days of Cæsar to those of Umberto. The classing of the Franks as Low Germans (p. 103) is not supported by their literary remains, which are the highest of High German. A part of the Franks have always remained in Germany, and have always spoken a High German dialect. To speak of the country of the Saxons in the days of Otto I. as "Saxony" (p. 139) is misleading, and to call him King of Saxony, instead of Duke of the Saxons, is incorrect. The "Austrian State" (ibid.) was far from being along with the Saxon the chief State of Germany in the ninth or tenth century. In speaking of the legislative work of Justinian, the writer seems to overlook the 'Novels,' by which smoothness and symmetry is given to the Old Roman law and most of its harsh and arbitrary rules are revoked. Take, for instance, the well-known 118th Novel, establishing the laws of descent upon the equality of the sexes, both among children and collaterals, and the abrogation of all preference of the *agnati* over the *cognati*. The people of Arabia before Islam did not claim descent from Ishmael (p. 86), but only the people of the Hijaz; the others knew little if anything of Bible genealogies.

There are some queer slips of the pen; thus, the Gothic historian Jornandes is disguised as "Jordanes" (p. 28). The first Khalif, Abu Bekr (Father of the Girl), is spoken of, for short, as Abu (p. 96), as we might abridge John Smith into John. The Langobards are before their conquest of Italy called Lombards (p. 76 and elsewhere); a name only given to the people of Lombardy when the Teuton conquerors had been fused with the provincials and colonists on the Po. Many other inaccuracies both of substance and of form might be quoted, without referring to some that may be the fault of the proof-reader. The most interesting parts of the work, showing most thought and independent treatment, are those dealing with the rise of the Christian Church, its Fathers and its warring divisions. Prof. Symes maintains a charming neutrality between the friends and enemies of Christianity, though sometimes it looks as if he justified the persecuting Roman Emperors, and at other times as if he preferred the faith and morality of the Moslem, if not to Christianity in gene-

ral, at least to that of Mohammed's time. The chapter on the Fathers (Clement, Origen, Tertullian, Augustine, Cyprian, Athanasius, Ambrose, and Jerome) and on Pope Gregory the Great, are to the general reader the most instructive and on the whole the most interesting.

Chapters on the Theory and History of Banking. By Charles F. Dunbar. G. P. Putnam's Sons. 1891.

MOST of these chapters were printed some years ago for the use of Harvard students, and they are now published with some valuable additional chapters and with copious explanatory notes, some of which refer to recent events in the financial world. About half of the book deals with the elements and ordinary methods of banking, and the remainder gives brief but interesting accounts of our national-bank system and of the leading European banks. The writer of such a treatise should possess above all things lucidity of thought and expression, and Prof. Dunbar can fairly lay claim to these qualifications. Moreover, a careful examination fails to discover any of the errors in facts and figures which so often annoy the reader of books devoted to financial affairs.

In discussing our national-bank system, Prof. Dunbar incidentally calls attention to two of its weakest points, namely, the certification of checks, which most bankers will agree with him in considering "peculiarly liable to abuse, and an efficient instrument for promoting hazardous speculation," and the concentration of country bank reserves in New York. Last October the national banks held 1,758 millions of deposits, calling for a reserve of 353 millions of cash. They actually showed a reserve of 478 millions, but of this amount only 282 millions was in cash, while the remainder was in the hands of correspondents in reserve cities—largely in New York. Now when we remember that at that period the New York banks held barely 25 per cent. of reserve, it is obvious that the country banks would have found it difficult to obtain their deposits in actual cash if any sudden emergency had compelled them to call for their money. In this respect the New York banks occupy exactly the same position towards the country banks that the Bank of England does towards the joint-stock banks and private bankers of London: they are the holders of the *ultimate* cash reserve, and as such they accept a serious responsibility in time of trouble. How serious that responsibility may become in a panic is best described by showing the condition of the Bank of England on November 12, 1857, when its deposits (belonging mainly to other banks and bankers) had been reduced to £13,000,000 and its available cash to £581,000.

In England the remedy for such a state of things is a suspension of the act of 1844, whereby the bank is enabled to issue notes uncovered by coin, and this remedy has been applied with entire success on three occasions. Our banks have adopted a somewhat similar plan by combining their reserves and issuing clearing-house certificates. This arrangement has been found to work well in the past, and will probably continue to do so in the future, unless the country banks should some day require a large amount of cash. The German plan seems to be on the whole the best that has yet been devised. Under the law of 1875, the banks can increase their issues of notes uncovered by cash beyond the legalized amount, but must pay a tax of 5 per cent. on such over-issues. The high rates they are compelled to charge their customers for such extra accommodation tend to diminish speculation, and act as a kind of automatic safety-valve.

In consequence of the rapid reduction of our bonded debt, the present national-bank circulation is being steadily reduced, and promises to become extinct before long. It is to be hoped that the early subsidence of the silver craze will leave us still on a gold basis, and prepared to adopt a new currency system founded on the only true measure of value. When that time comes, Prof. Dunbar's record of the experiences of European nations should be a valuable guide to our legislators.

Typical Elms and Other Trees of Massachusetts. Introductory Chapter by Oliver Wendell Holmes. Descriptive Text by Lorin L. Dame. Plates by Henry Brooks, reproduced by the photogelatine process. Boston: Little, Brown & Co. 1890. Folio, pp. 89, tt. 58.

THIS fine volume is the realization of a wish expressed long ago by the Autocrat of the Breakfast Table that some one would publish a set of "Photographs of New England Elms and other Trees taken upon the same scale of Magnitude"; and it is a pleasant thing to note that the Autocrat himself, now almost "the last leaf upon the tree," has with his own pen written the Introduction. Meanwhile, the great Elm of Boston Common has fallen, and the Washington Elm in Cambridge is fast dropping to pieces; the Charter Oak lives chiefly in its seedling, a fine and thrifty tree in the Hartford Park; and the Stuyvesant Pear-tree is reduced to walking-sticks and perhaps a chair in some Historical Society. Twenty-four of these plates represent a careful selection of the largest and most beautiful, or at least most noteworthy, elms of Massachusetts. The letter-press gives the traditions which have gathered about each tree, like the moss on its trunk, and to this lore is added the measurement of girth, of height, and of widest spread of the branches. The "other trees" of the Autocrat's prophecy are several oaks of various kinds, three rock-maples, three pines, two hickories, as many nettle-trees and horse chestnuts, and one each of ashes, willows, and chestnuts, the buttonwood, the sassafras, the three-thorned acacia and the black walnut—all large and well-chosen examples of their kinds. None of the oaks described attain the dimensions of the Charter Oak; and as that tree must have counted its age by centuries on centuries, they are all saplings in the comparison. Even the little-known white oak of Northford, in Connecticut, is considerably larger (and doubtless older) than any of those mentioned by Mr. Dame.

This book is more than interesting: it is an invaluable contribution to American forestry, and forms a most worthy companion to Prof. Sargent's 'Silva.'

Life of W. M. Thackeray. By Herman Merivale and Frank T. Marzials. [Great Writers Series.] London: Walter Scott; New York: A. Lovell & Co. 1891.

IN estimating a Life of Thackeray, allowance must be made for the meagreness of the materials, and perhaps such a biography as the present was needed to show just how small and uncertain our knowledge of his personal life is. The book, however, is unusually rambling and inconsequent. It is the work of two different authors, who have little in common in their notions of how a biography should be written. Mr. Merivale contributes the earlier chapters and a final one, and he had the advantage of some private family papers from which he extracted an account of the ancestors of the novelist, and also passages from his schoolboy letters and college diary; but this new matter is of a very slight kind, and the substance of Mr. Merivale's part is in the main his own thoughts about Thackeray. It is all very pleasant talk at an easy-going pace, but it is not biography. He writes of Thackeray's qualities, and illustrates them; he combats the criticism of Miss Jameson, too inane to require notice, and of Trollope, which was of little more consequence in itself. He thinks Thackeray's moods are explained by saying that his was a disappointed life, and that he was consoled in his discouragement by religion of a simple, pious kind; if he was idle, it was the way of his genius; and at all events his prose is excellent novelist's talk. This is the manner of Mr. Merivale's writing, and though a sincere admiration of Thackeray is constantly felt and a disposition to defend him against all comers is pugnaciously shown, the reader does not advance much in knowledge of the facts of his personality. Mr. Marzials takes up the thread, and, though he is more systematic in his work, he is obliged to draw upon the novels themselves for his filling in, and he does little more than gather from scattered mention of Thackeray in memoirs of other people what may serve to complete the lists of dates, lectures, and journeys. The book is successful in this bringing together of incidents and anecdotes; it is interesting to read; but, after all is said in its favor, it remains only a prolonged talk about the author, now narrative, now speculative. At the end there is an attempt to reconcile the conflicting impressions made by Thackeray on those who met him, and to ascribe much to his Bohemian life, his moodiness, and his ill-health. The one thing made out is that no Life of Thackeray exists, and consequently there is not sufficient evidence to base a personal characterization on.

Shakespeare's Coriolanus. Macmillan & Co. 40 cents.

JERRY.

The anonymous novel which appeared in *Scribner's Magazine.* 12mo, $1.25.

Detroit Free Press: "The author is one who seems to have the happy gift of endowing imaginary characters with the reserve force that is so rare in real life."

Cincinnati Christian Leader: "The work of a genius, a wonderful story."

Boston Beacon: "To be classed with the most remarkable fictions of recent years. . . . Convinces one of the advent of a new force in American literature."

Boston Budget: "Remarkable. . . . The writer exhibits virile characteristics."

New Orleans Times-Democrat: "Literature is the richer for the advent of this new writer."

Independent: "They have unearthed a prize in the author of 'Jerry.' . . . There is nothing immature in the writer's style, and if he is a young man we hope he will preserve his anonymity for many years to come, and not allow himself to be ruined by easy fame."

HENRY HOLT & CO., New York

BISHOP VINCENT writes JUDGE TOURGEE:

"You have written a great book in Murvale Eastman. I wish every minister, every workingman, every millionaire, and every political economist would read it. . . . A wise, hopeful, artistic, Christian story, with a broad basis of soundest sense. It has inspired me."

"Not to have read it will soon be a humble confession."—*Baltimore Methodist.*

"Here and there trenchant sarcasm deals more effectively with evils than could the most elaborate argument or appeal. It is a book for the times."—*Ill. Christian Weekly.*

MURVALE EASTMAN, CHRISTIAN SOCIALIST. 12mo, 545 pp., $1.50.

"'JUGGERNAUT'—That is the Hindoo car that runs over people and crushes them, isn't it? Yes. Well, now, let me call your attention to an interesting fact about that car. Did you ever observe that it never runs over the people that ride on it?"—*Extract from that powerful story of modern life by George Carey Eggleston and Dolores Marbourg.* 12mo, cloth, $1.25.

"The story of 'JUGGERNAUT' is a powerful one. . . . It will be read for its tragic pathos. The moral of it needs no emphasis; it lies on the very surface of the tragedy. . . . Ought to be widely read."—*Christian Union.*

The Nation.

NEW YORK, THURSDAY, APRIL 23, 1891.

The Week.

Mr. BLAINE'S reply to the Marquis Imperiali on the lynching of Italians by the mob of New Orleans is a very straightforward paper, presenting in clear and respectful terms the position of our Government and the limitations of our Constitution. The substance of it is, that the punishment of the murderers must be left to the local tribunals in the first instance. If the local tribunals do not act as they ought to act and as the local laws require them to act, "it will then be the duty of the United States to consider whether some other form of redress may be asked." Our treaty with Italy does not require us to give greater protection to her citizens domiciled here than is given to our own citizens in like circumstances. Mr. Blaine fails to add—indeed, he could hardly be expected to add—that the lynching of American citizens is a not uncommon incident in the latitude of New Orleans, and that the punishment of the lynchers is very uncommon. "Where the injury inflicted upon a foreign resident," he continues, "is not the act of the Government or its officers, but of an individual or a mob, it is believed that no claim for indemnity can justly be made, unless it shall be made to appear that the public authorities charged with the peace of the community have connived at the unlawful act, or, having timely notice of the threatened danger, have been guilty of such gross negligence in taking the necessary precautions as to amount to connivance." This paragraph clearly looks to the payment of a claim for indemnity, since the public authorities did have timely notice of the threatened danger and took no steps to prevent it. But the Executive branch of the Government is not supplied with a contingent fund to pay such claims. It can only recommend an appropriation by Congress for that purpose, and that is what Mr. Blaine virtually promises.

The observation of the London *Daily News* that this is "fine sport for Mr. Blaine" is very unjust. Nothing has happened since he took office so extremely mortifying to him—a mortification which is shared by every American of intelligence and self-respect. The country has got a bad name by reason of this lynching affair. It will be a long time before the recollection of it wears out at home or abroad. It was a case of high-handed murder, by the statutes of our own and of every other civilized country. The character of the victims makes no difference in the eyes of the law, and it is only by the eyes of the law that foreigners can look at it. Americans travelling in Europe will be assailed with unpleasant questions for a long time to come. The task of standing up and taking it, as Mr. Blaine must by virtue of his office, is far from agreeable. It is the very reverse of fine sport. The only advantage that Mr. Blaine gains from it is that it turns public attention away from his correspondence with Lord Salisbury on Bering Sea matters, where he was getting the worst of it.

It is very difficult to find out, either from the Marquis di Rudini's remarks in the Italian Parliament, or from his written communications to the State Department, what the exact position of the Italian Government in relation to the New Orleans massacre is. Since he abandoned the demand that the United States Government should "punish" the guilty parties, he has failed to make clear what it is he wants. The machinery of justice has been put in motion by the State authorities, and no definite cause of complaint can therefore arise under the law of nations until the State authorities refuse to prosecute, or prosecute with patent negligence and reluctance. His speeches, as well as despatches, in fact, corroborate the guess of the London *Times*, that he is using the incident to strengthen his Ministry at home—an operation in which he is sure to enjoy the secret sympathy of Mr. Blaine, who "knows how it is himself." He must enjoy dealing with the Marquis, who is evidently a man of his own size, after his uncomfortable bout with a big fellow like Salisbury. But can we wonder that foreign diplomatists look on us as barbarians from whom neither law, justice, nor courtesy is to be expected, when they read such remarks as this coming from a United States Senator—namely, Plumb of Kansas? *We* understand Plumb, but why should the Italians understand him?

> "The whole thing is not worth talking about. Suppose the Italian Minister is recalled. Who cares? His departure is of no more consequence to the American people than if the banana-vender who presides over a push-cart at Fifteenth and F Streets should close out business and decide to go home. It's just one man less to board, and that's the only subject for thought there is in the whole matter. Of course there's got to be a lot of letter-writing over the affair, but Mr. Blaine is attending to that most admirably. No one could do any better."

The Italians and all Continental nations believe in courtesy and self-restraint as essential in the forms of intercourse of civilized men, and they make, from the absence of it, all sorts of unpleasant inferences about character. Most of these as applied to Americans are absurd. Senator Plumb would, no doubt, refuse to join in a massacre of unarmed prisoners; but when foreigners hear a man in his high place talking in this way on such an occasion, they believe him and his constituents equal to any act of savagery.

The concessions made by the Spanish Government with reference to trade between the United States and Cuba are of real importance, and in this respect they differ from those made by Brazil, which are really unimportant. It is a misnomer to call either of these concessions reciprocity treaties. The United States has removed the duties on sugar. Thereupon Spain lowers the duties on American flour and cereals and repeals the duties on some other articles, the list of which is not yet published. If Spain's treaty engagements with Great Britain, France, and Germany, or either of them, contain the "most favored nation" clause, and if this clause applies to her colonies, she will be compelled to extend to them the same treatment as to ourselves. This would prevent us from gaining any advantage over other countries in the sale of articles, either raw or manufactured, unless we have a natural advantage. But in cases where we do have a natural advantage the gain will be decided. This will be especially seen in the export of flour, grain, and provisions, and here the gain will be even greater to Cuba than to ourselves. The island has been hitherto chained to the mother country by a tariff so highly protective that American wheat could be bought and carried to Spain, converted into flour there, and shipped to Cuba at a large profit to the Spanish millers. In other words, the Cuban consumer has been "exploited" for the benefit of the Spanish producer in exactly the same way that consumers are exploited for the benefit of producers in this country. This sort of thing is now to be restricted, if not stopped altogether, and the Cubans will reap a great advantage by the simple privilege of being allowed to enjoy their own earnings. The Spanish millers made a vehement protest, of course—the protected classes always do that when anybody interferes with their plunder—but the danger of a new rebellion in Cuba was the greater terror of the two in the eyes of the Madrid Government.

The blow has fallen upon the Republican Boys of Brooklyn. Secretary Tracy's order putting the Navy-yard force upon a thoroughgoing civil-service-reform basis after June 1, leaves no doubt that the Secretary intends to break up the spoils system completely. His order declares that on June 1 all positions of foreman or master mechanic shall become vacant, and that the positions shall be filled by men who pass the best examinations—that is, show the highest fitness for the work demanded in them. The Board of Examiners that the Secretary names for this work is made up of naval officers whose high character gives ample assurance that there will be no humbug about the examinations. These will begin on May 11, and will be open to all comers who are American citizens, present employees being on the same footing as all other candidates. There will be no chance for "pulls" of any kind to be exerted in anybody's behalf, but merit alone will decide in each case. A similar transformation is ordered to take place in the Norfolk Navy-yard on July 1, and Portsmouth, Washington, and Mare Island will follow in due time. This will be a great

and most salutary reform, and the Secretary cannot be commended too heartily for bringing it about. Reformers are hoping to see the President, before the close of his Administration, make the new system permanent by an executive order placing the whole matter in the charge of the Civil-Service Commission, where it belongs. Let us hope that he will do this without waiting till the end of his term, for delay in such matters is always a risk with the President. A displeasing act of any kind on the part of some wicked Democrats, in remote parts of the land, is likely at any moment to convince him that there can be no more civil-service reform till conduct of that kind has been rebuked by giving a few more offices or a little more patronage to partisan Republicans.

President Harrison fell into a serious error when he remarked in his speech at Johnson City, Tenn. (and he has since repeated it): "We have a common heritage. The Confederate soldier has a full, honorable, and ungrudged participation in all the benefits of a great and just Government." The truth is, that every Confederate soldier is absolutely debarred from holding any position in the army of the United States, section 1218 of the Revised Statutes, enacted on the 28th of July, 1866, reading as follows:

"No person who has served in any capacity in the military, naval, or civil service of the so-called Confederate States, or of either of the States in insurrection during the late Rebellion, shall be appointed to any position in the Army of the United States."

The really significant feature of this matter is, not the fact that Mr. Harrison was guilty of a serious blunder of ignorance or forgetfulness, but rather the fact that it was Mr. Harrison's vote in the Senate five years ago this very month which turned the scales and kept on the statute-book the most odious and galling of all the discriminations which could possibly be placed upon the Confederate soldier. On the 7th of April, 1886, the Senate was considering a bill to increase the efficiency of the army, when Mr. Gibson of Louisiana proposed an additional section repealing the section of the Revised Statutes just quoted, so that men who had served the Confederacy might be eligible as appointees to the new places in the army created by the bill. When the vote was taken, it resulted in 24 yeas for the amendment repealing the statute and 25 nays. Among those recorded as absent was Mr. Harrison, but he had taken the precaution to make sure that his absence should not prevent his position on the question from appearing. The *Congressional Record* contains this statement:

"Mr. Berry (when the name of Mr. Jones of Arkansas was called)—My colleague [Mr. Jones of Arkansas] is paired with the Senator from Indiana [Mr. Harrison]. If my colleague were here, he would vote 'Yea.'"

The Springfield *Union* publishes an interview with Mr. Huston, the Treasurer of the United States, on the subject of paying out silver or silver certificates in cases where the payees desire gold. The question arose on the payment of the direct-tax refund to the State of Massachusetts, in which case silver certificates were tendered and were objected to by Boston bankers. "It would not do," said Treasurer Huston, "to give New England or the East gold, when we have given the West silver. It is but another form of the fight against silver. Ohio took over a million and a quarter of silver money, and never murmured. Illinois, Indiana, and other Western States never thought of protesting against silver. The idea of the East is to concentrate the silver in the West and hoard the gold East. *Then I presume the East would move for a premium on gold.* The Government could not afford to countenance such a movement. It must treat all sections alike. The Department has these silver certificates on hand, and they are to be paid out on first demands." If these are Mr. Huston's ideas, he cannot retire too soon from the office he now holds. When the Government begins to discriminate between gold and silver, the public will be apt to follow the example. No Treasurer of the United States, since specie payments were resumed, has assumed the option of paying out a particular kind of money against the wishes of the payee. Lest some future Treasurer should assume that option, Congress passed a declaratory law on the 14th of June, 1890, saying that it was "the established policy of the United States to maintain the two metals on a parity with each other upon the present legal ratio, or such other ratio as may be established by law." Does Mr. Huston understand that the act of June 14, 1890, is valid only at the Sub-Treasury in New York? If so, he establishes a rate of exchange in favor of New York as against every other commercial centre. He creates a premium on New York funds equal to the cost of shipment of silver certificates and the return of the proceeds. "The East will move for a premium on gold," forsooth! That is a Hoosier conception indeed. The notion that a premium can be made arbitrarily by one section, or by all sections together, is like supposing that a man by taking thought can add a cubit to his stature. The only man who can make such a premium is the Treasurer himself, and he can do it only by alarming other people.

The Boston *Transcript* takes Mr. Geo. S. Boutwell to task for saying, in a speech to the Neo-Republicans of Massachusetts on Wednesday week:

"We are now practically upon a silver basis, and I would offer this suggestion to the Republican party: That all the silver produced within the limits of the United States be coined into currency, and that all the silver mined in other countries be excluded. The idea of putting Germany, England, and the United States upon a gold basis is most suicidal. The time is not far distant when all the countries of the world will be upon the double standard of gold and silver."

It was Secretary Boutwell who recommended the passage of the act demonetizing silver—the act of 1873. His ideas on the subject were perhaps no clearer then than they are now, but he was under better advice then than he is now. The *Transcript* regards his present sayings as merely an attempt to bolster up the protective system by excluding foreign silver and taxing the people to pay handsomely for the domestic product. That may account for the major part of the paragraph quoted, but it does not account for the statement that "we are now practically upon a silver basis." The only way to account for that is by assuming that Mr. Boutwell is considerably off his own basis.

Mr. David A. Wells contributes an interesting chapter to the history of the tin-plate tariff. The drawback on this article when exported in the form of cans is now 99 per cent. of the duties. It was formerly only 90 per cent., the Government reserving 10 per cent. as the equivalent of the cost of collecting the duties, identifying the re-exported article, and refunding the money. The result of the change is to give the Standard Oil Company, which is by far the largest user of tin plate for export, 9 per cent. more than it received under the old law. This is not regarded by Mr. Wells as an objectionable feature, nor ought it to be regarded as such by anybody. The export trade in refined petroleum amounts to $41,000,000 per year, and it has to be carried on in competition with Russian petroleum. The Government ought not to put any obstacles in the way of it. But the fact that the system of our tariff furnishes petroleum packages cheaper for foreigners than for American citizens should not be overlooked. A still weightier fact is mentioned by Mr. Wells, viz., that when the new duty on tin plate began to take shape in Congress, the demand for the article increased, and this caused the price to advance. Everybody wanted to lay in a large stock before the duty should take effect. The price rose to such an extent, and the quantity taken was so great, that it is estimated by good judges that the Welsh manufacturers have reaped an extra profit, since last summer, equal to the entire value of their plant. For this they are indebted to our Mr. McKinley and our Mr. Aldrich mainly. Of course the American consumers of the article pay this extraordinary bonus tossed into the laps of the British tin-plate makers.

How *our* tin-plate works are coming on is a matter of dispute. The *Iron Age*, the most sedate and the best informed of the iron-trade journals, does not consider the outlook encouraging. In its issue of April 16 it says:

"It must be confessed by the most ardent friends of the new industry that the progress thus far made in the domestic manufacture of tin plate has been disappointing. Tin plate and terne plate are being made at several works, it is true, and preparations are going on looking to the erection of other plants, but there is a conservatism, a deliberation, about the whole proceeding which is decidedly at variance with the activity promised by the advocates of a tin-plate industry. It had been supposed that a large number, if not a majority, of the sheet mills would add cold rolls and tinning stacks as soon as adequate tariff protection was assured. This has been done in very few cases, and, so far as we can learn, there are not many sheet-manufacturers to be added to the list of tin-plate makers. The business appears to be remanded by quite general consent to those who will make a specialty of it. The

sheet mills are evidently not inclined to make the tin-plate manufacture an appendage of their business."

This apathy on the part of the sheet mills, the *Iron Age* thinks, ought to incite the friends and advocates of a domestic tin-plate industry to "missionary work in their own ranks," because, "at the present rate of progress, it is beyond the power of man to calculate when this country will be able to supply its own tin-plate requirements." Perhaps the owners of the sheet mills have had their ardor dampened by late reports from the Black Hills tin mines.

The most striking feature of the recent municipal elections in Kansas was the political aspect which woman suffrage assumed. The law giving the sex the right to vote in municipal elections was passed by a Republican Legislature, and was expected by most of the Republican managers to inure to the advantage of their party, although it is recalled that Gov. Martin did not share this view, and warned the brethren that they would live to regret their action. It was generally believed, however, that the woman vote could be held solid for the Republican party by loud denunciations of the Democrats as "the whiskey party," the "enemies of the home," etc. The latest elections, however, show that the women cannot be depended upon, and that they are always liable to turn over to the Democrats a city which might otherwise go Republican. The Republican organs of Topeka, for example, made every possible effort to prejudice the women against the Democrats, notwithstanding which the Democratic candidate was elected by a total of 4,031 to 3,862 for the Republican, and it is conceded by everybody that he owes his election to the votes of women who are the wives and daughters of Republicans. It was the same way in Leavenworth, where a separate count of the votes cast by men and women was made, which showed that the men were almost evenly divided between the two parties, while the Democratic candidate was supported by 1,232 women, and the Republican by only 945. A similar count in all but two precincts of Kansas City, Kan., showed 787 votes by women for the Democratic candidate, as against but 657 for the Republican; and the success of the Republican candidate by a narrow margin is attributed to the fact that many of the women who were registered did not turn out and help to swell the majority which their sisters cast for the Democratic nominee. Fort Scott is another city where the defeat of the Republican ticket is attributed to the vote of the women.

Naturally, the Republican managers are "mad" at the women, and they make no attempt to conceal it. The chief Republican organ in the State is very bitter. Quoting from another newspaper the remark that "the Equal Suffrage Association is entitled to praise for its good judgment in voting solidly for Cofran," the *Capital* says: "If the above was true, it would simply prove woman suffrage a failure." Again it remarks: "The W. C. T. U. women who helped to defeat the Republican ticket have done more to destroy respect for municipal suffrage for women than they can patch up in ten years." And once more: "One or two more slams such as the women gave the Republican party in Topeka, and there will not be one of the old friends of municipal suffrage left to raise a voice against the repeal of the law." This reminds us that last fall the Republican managers throughout the North were complaining that the women had put the Democrats in power by telling their fathers, and husbands, and brothers that they found the McKinley Bill a bad thing for the family; so that it looks as if the women, with or without suffrage, were no longer to be counted on by the Republican party.

The adjournment of the Minnesota Legislature, with the complete failure of all the measures which were brought forward in the supposed interest of the Farmers' Alliance, is likely to have the same effect upon the Alliance movement as similar failures in Kansas and Nebraska had. The most immediate effect will be upon the Alliance members, who will be thrown over as useless because they have accomplished none of the things expected of them. The secondary effect will be to discourage and demoralize the Alliance itself, for the people who enter into movements of this kind want to have the reforms they are in search of granted immediately. They never take into account the difficulties in the way of drafting and enacting laws to meet especial requirements like theirs. Many a "friend of Labor," in one legislative body or another, has come to early grief because of his inability to put into the form of a law the reform which he had been advocating with great volubility at the time of his election. It is one thing to declare that "something ought to be done," and quite another thing to do something in a legal and effective way. Yet every leader in a people's reform movement is expected to do something in this way, and to do it at once; and if he fails, the end of his career has come.

The statistics which the Secretary of State has published, showing that throughout this State last fall 456,000 people registered who did not vote on election day, are merely fresh evidence that the Republican voters of the State were not in harmony with the policy of their party on the tariff question. It is obviously an error to attribute the falling off in the vote from the registration to the new Ballot Law. Voters who were timid on that point would not have taken the trouble to register. The simplest explanation is, that thousands of Republicans who thought in October that they might vote as usual with their party in November, became so much displeased with their party through the developments of the campaign, and through the workings of the McKinley Bill, that they concluded to stay at home when election day came around. We commend this falling off of nearly a third from the total registration to those Republican opponents of ballot-reform in Pennsylvania who maintain that registration is objectionable because voters will not take the trouble to get their names on the lists.

The bill to provide lyceum lectures at public cost has passed both houses of the Legislature, and is in the hands of the Governor. "His approval is not doubted, but friendly comments by the press may still be useful," says an anonymous circular which has just been sent to us. The circular itself contains friendly comments of the machine-made sort from several rural journals; from the New York *Press*, also, which quotes in favor of the bill "Dr. Chauncey M. Depew," who, the *Press* elegantly says, "in addition to his other relations, is simultaneously Vice-President of the University and School Extension and a Regent of the University of the State of New York"; and finally from the New York *Evening Call*, a journal thus for the first time made known, we suppose, to students of public opinion in New York. The *Evening Call*, however, out of all these authorities, does manage to express the soundest view when it characterizes the scheme as "an educational course that is as near like the Chautauqua course as anything else."

In reading of the English disaster, promptly retrieved, at Manipur, on the borders of Burmah, one must bear in mind that the character of the Indian frontier renders the English very liable to incidents of this sudden and startling kind. Their border line nowhere touches the territory of another organized and responsible government; it runs for hundreds of miles along the skirts of highland country inhabited by predatory races, the irreconcilable enemies, so long as they are free, of the orderly, law-making European. To subdue and pacify them involves an unprofitable expenditure of lives and money; and, moreover, on certain parts of the frontier this zone of tribal land serves as a barrier against more formidable enemies beyond; it is like a quickset hedge full of thorns, good to keep out trespassers. So the English are apt to be content with occasional punitive expenditures, or with reliance upon political influence, until some substantial mishap or disorder calls imperatively for severe measures—until, as at Manipur, some imprudent jump into the quickset hedge draws blood. The line between a civilized province and utter barbarism on the Indian frontier is so slight that English officers, accustomed to the tranquil docility of the Indian folk, are apt to overstep it hastily, with such consequences as have just been witnessed at Manipur. But these consequences, however painful and inglorious, are of no deep or far-reaching political importance; and one result will be that the ever-advancing margin of regular and irresistible government will be pushed forward more speedily, and be laid down more firmly in an almost unexplored borderland.

THE SERIOUS OUTLOOK IN BERING SEA.

WITHIN a few weeks fur seals will begin to go from the Pacific Ocean through the Aleutian passes to our islands and to the Russian islands in Bering Sea. Canadian vessels and American vessels will lie in wait to kill the seals as heretofore. What orders will President Harrison give to our revenue cutters to be sent to those waters? Will he command the seizure of Canadian vessels found killing seals outside of a marine league from land; and if such seizures shall be attempted, will British cruisers resist, or recapture by force? Will Canadian schooners arm for their own defence? The country has recently been thrown into not a little emotion by rumors of resentment by the Italian Government for what happened at New Orleans; but what will come to pass if President Harrison shall order a seizure in Bering Sea of a British vessel, and Great Britain resents the seizure by an angry gun, or even by an angry note? Those who can influence the future conduct of the Administration in this critical emergency will do well straightway to bestir themselves and look carefully into the situation. These are a few of the more important facts:

On the 2d of March two years ago, President Cleveland approved the law releasing the Secretary of the Treasury from direct responsibility to Congress for correctly defining "the dominion of the United States in the waters of Bering Sea," and putting the duty on the President instead. Nineteen days thereafter President Harrison issued a proclamation warning all persons against entering those waters to violate section 1956 of the Revised Statutes, and threatening to arrest and punish all persons or vessels "engaged in any violation of the laws of the United States in said waters."

He did not describe the waters by metes and bounds of latitude and longitude. He probably sent our revenue cutters into Bering Sea with vague orders to execute the laws, leaving the officers of those vessels to discover as best they could "the dominion of the United States in the waters of Bering Sea." Canadian customs officers, charged with the duty of clearing vessels for fishing in Bering Sea, may reasonably have assumed that, as our Congress had refused to interpret the laws of 1868 and 1870 as the Alaska Commercial Company sought, the President would not undertake to police all of Bering Sea east of the boundary prescribed in the Russian treaty as embracing the islands ceded to us, except as regarded American citizens. But what happened in 1889? The *Triumph* was seized on July 4, the *Black Diamond* and *Favorite* on July 11, the *Minnie* on July 15, the *Juanita* on July 31, the *Pathfinder* on August 27, and the *Ariel* and *Lily* about that time, and the *Sayward* was ordered off on July 11. All those seizures of British vessels were made outside of the marine league, and a great distance from any land. No seizures had been made in 1888, although all of those vessels, and fourteen other Canadian vessels, were in 1888 engaged in killing seals in the same waters, averaging an annual catch of about 3,000 skins each. Besides them, there were nearly as many American vessels. Up to 1886 there were no seizures; the first three seized in that year were released by President Cleveland, and Congress had refused in 1889 to condemn the release when asked by the Alaska Commercial Company.

In December of that year Secretary Windom invited proposals for a new lease of our Pribyloff Islands, but made no definition of the area of "adjacent waters." On the seventh of the next month Senator Plumb asked the Senate to request the Treasury not to make a new lease till a full report had been made by the Treasury in respect to the subject; but, nevertheless, early in March a new lease was given to a new company, of which Mr. D. O. Mills is President.

Late in August, 1889, Lord Salisbury instructed the British Legation at Washington to see Mr. Blaine at once in regard to the Harrison seizures of that year; to remind him that assurances had been given, through Mr. Phelps, that no further interference should take place with British ships in Bering Sea at a distance from shore, pending the general discussion of the issues; and to add that such seizures (which her Majesty's Government could not permit) "will hinder a settlement." Mr. Edwardes found Mr. Blaine at Bar Harbor and delivered to him the message. He replied that he had "no official communication" reporting the seizures, but that he would at Washington discuss with Sir Julian the questions presented. On September 12, 1889, Mr. Edwardes asked Mr. Blaine when a reply could be expected to England's request that the President put a stop to the seizures, and Mr. Blaine answered that "a categorical response is impracticable." On November 24, 1889, Mr. Blaine and Sir Julian met to open the discussion foreshadowed by Mr. Blaine at Bar Harbor. The former began with the remark that the seizures of 1889 "had been *effected* by the Treasury" under the belief that they were "warranted by the act of Congress and the proclamation of the President." Sir Julian replied that such seizures appeared like an assertion of "*mare clausum.*" Mr. Blaine answered that the United States "had not *officially* asserted such a claim," and, therefore, "it was unnecessary to discuss it." Sir Julian rejoined that the seizures were not justified either by the statute or by the proclamation. Finally, it was agreed in the course of the conversation that, on a subsequent day, they two, aided by the Canadian Minister of Marine, should proceed to inquire whether or not the fur-seal species is in danger of extermination by what goes on in Bering Sea, and whether there is need of a "close season."

On January 22, 1890 (dates are important), before the negotiators had come together again, and while the only issue was one of fact in respect to physical data, Mr. Blaine suddenly flung into the arena, by a note to Sir Julian, the *contra bonos mores* contention, insisting that "the law of the sea" cannot be "perverted to justify acts immoral in themselves," like killing fur seals. At the next meeting of the negotiators, Mr. Blaine submitted such evidence as he had to show that open-sea fur-seal killing is diminishing seal life and is *contra bonos mores.* Canada controverted it by counter evidence tending to show that there were seals enough for everybody, and our Pribyloff lessees were only really worried by the peril of a reduced price of the skins, and making the fur unfashionable in London and Paris. The divergence of opinions and the contradiction of testimony were so unmanageable that Mr. Blaine said to Sir Julian, on March 12, 1890, that a solution by him of the problem of fact was hopeless, and asked for an English plan. Then, on April 29, Sir Julian submitted his draft treaty. Canada did not like it, but accepted it. Mr. Blaine, instead of debating the plan with his associates, and seeking then and there to modify its terms in our interest, abruptly brought the discussion to an end.

The only pending question, it must be kept in mind, was whether or not any restrictions on pelagic sealing were then necessary for the preservation of the fur-seal species; and, if necessary, the character of such restrictions. Three weeks later Mr. Blaine, having made no definite reply to his colleagues, took the British plan to the Cabinet. The New York newspapers of the 23d of May and thereabouts described what happened. President Harrison said in his next annual message that Sir Julian's proposal was rejected because defective in "*form.*" On the 22d of that month the New York newspapers reported that, at a Cabinet council, it had been decided to order our revenue cutters not to capture Canadian vessels and take them to Sitka for forfeiture, but to seize the skins, dismantle the vessels, and turn them loose. Sir Julian went forthwith to see Mr. Blaine, and remonstrated with him for such orders pending negotiations and before any reply had been given to the British proposal of arbitration. Mr. Blaine said "the press could not be controlled." He inveighed in a violent way against the British plan. He said there "would be no seals without the seal islands." He generally lost control of his temper, and ended by telling Sir Julian that he (Blaine) "did not think we should ever agree as to the *form* of questions to be submitted to arbitration." He did not deny the dismantling orders.

On May 22, 1890, Lord Salisbury replied to Mr. Blaine's *contra bonos mores* note of January 22, 1890. Seven days thereafter Lord Salisbury cabled to Sir Julian that his report of the brusque conversation on the 22d instant, in which Mr. Blaine had not denied or explained the dismantling orders, had been laid before the Queen, and Sir Julian was directed to solemnly warn Mr. Blaine of the consequences of the contemplated interference with British vessels. On May 29 Mr. Blaine replied to the communication of protest, but said nothing of dismantling vessels and seizing skins, and then came Mr.

Blaine's long note of June 30, 1890. On that date Sir Julian replied to Mr. Blaine's of May 29 complaining that Lord Salisbury abruptly closed the negotiations in 1888 because "the Canadian Government objected," and that he "assigned no other reason whatever." Sir Julian called Mr. Blaine's attention to the following statement made to Lord Salisbury by Mr. Phelps, the United States Minister in London, on the 3d of April, 1888, and which was recorded in a despatch of the same date to her Majesty's Minister at Washington. "Under the peculiar political circumstances of America at this moment," said Mr. Phelps, "with a general election impending, it would be of little use, and indeed hardly practicable, to conduct any negotiation to its issue before the election had taken place."

That was more than six months before the November voting. Nothing has intervened since last July to relieve the tension. President Harrison and Mr. Blaine have put the country into a *cul de sac*, out of which retreat will be unpleasant and unpopular. It is fortunately in the power of the Supreme Court to rescue the nation out of the blunders of such "magnetic" and *contra bonos mores* diplomacy, and avert the mortification for self-respecting men which will attend either an order to our revenue cutters not to seize outside the marine league, or a renewal by Mr. Blaine of negotiations for a close season on the lines which the Cabinet rejected a year ago in such an irrational way.

THE FASSETT REPORT.

The Fassett Committee has made a report which is filled with both valuable suggestions and information. Most of the topics touched on merit separate and careful discussion. The central idea is the extension of home rule for cities by means both of a constitutional amendment and of a general law. The constitutional amendment is "to protect cities against the power of individuals to appeal to the Legislature, and to protect the Legislature from the necessity of entertaining such appeals, by restricting its power to legislation by general laws." The general law is to furnish a plan of government "for all cities in the State, whereby larger powers shall be granted to local authorities and the Legislature correspondingly relieved." These suggestions are to meet two of the four "chief difficulties which underlie the government of cities in this State." The other two are the absence of any machinery for supplying the Legislature and the people with statistical information touching "the general condition of the government of cities," and "the subordination of city business to the exigencies of State and national politics."

We have no doubt that, as a piece of diagnosis of municipal difficulties, the foregoing is perfectly correct, even if it be not entirely new. It was all set forth with much fulness in the report of the Tilden Municipal Commission, with which, in fact, this report expresses concurrence, except on one point. But the report has the defect which characterizes nearly every official document that deals with the problem of city government, as it is now presented to us in this State, in that it assumes that the evils described can be effectually cured by some sort of new legislation.

For instance, it proposes a "general law" regulating the government of cities in order to prevent special legislation at the instance of individuals with sinister aims. This would be an excellent suggestion if our Legislature were a permanent body of serious-minded and well-informed men bent on the maintenance of good government. As a matter of fact, it is, at every session, largely composed of new men, who look on their service at Albany as a sort of "lark," combined with a chance of making a little money for themselves or their district, and pass bills of every description without the slightest regard to their effect, near or remote, on the general welfare. What chance would there be in such a body that a general law would escape modification for two sessions in succession? Judging by experience, not the smallest. Its existence would give the individual seeking special legislation a little more trouble, but would not discourage him in the least. Having secured the necessary "pulls" and backing, he would go to Albany with the draft of a bill providing that section —— of the General Laws should be altered "so as to read as follows," and he would get it carried with no more pains than he has to take now in getting what he wants. The indignant protests of the publicists who relied on "the general law" would excite much merriment.

The fourth difficulty pointed out by the Committee really contains or covers all the others, viz., "the subordination of city business to the exigencies of State and national politics." On this the Committee ought to have expended far more time and space. This is the *fons et origo malorum*, but no man in public life likes to discuss it thoroughly, because, if he did, it would bring him at once upon the fundamental fact of all municipal trouble—the mental attitude of the majority of voters towards municipal affairs. All discussion of municipal government which assumes that this is what it ought to be, or that, if wrong, it can be righted by some new act of the Legislature, is really futile. Right-minded men can make almost any form of popular government produce public comfort and content. Wrong-minded men can make the very best form of popular government dangerous to property and order. The reason why city business is subordinated to the exigencies of State and national politics is simply that the bulk of the voters either desire it, or care nothing about it. No rearrangement of the State laws or Constitution can prevent this. The curious and absurd junta by whom we are now ruled were put in office, in the teeth of the clearest evidence of their unfitness, last fall. The reason it was done was, that the majority either cared more about the effect of Grant's reëlection on national politics than about its effect on "city business," or else did not care a rush about its effect on either.

What this means is, that the effort to improve municipal government is moral rather than political work — persuasion rather than legislation. The true causes of our municipal degradation are three in number: the large foreign, ignorant, and corrupt vote controlled by Tammany Hall; the determination of a large body of intelligent and educated voters of both parties to use municipal elections, at any cost, to affect Federal elections and legislation; the selfish indifference of a large body of the well-to-do about all local interests. Now we affirm, positively, that if the Laughlin amendment were adopted separating municipal from State and Federal elections, so as to diminish the temptation to use the former to affect the latter, and the voters voted at municipal elections with a single eye to municipal needs, using business tests to determine the fitness of candidates, we should have as good government in this city as any change in the charter could give us. We affirm with equal confidence that in default of this state of mind on the part of the voters all amendatory legislation will be useless. "Rend your hearts and not your charters" should now be the motto of every municipal reformer.

THE DEPOPULATION OF THE RURAL DISTRICTS.

A precise separation of the rural from the urban and semi-urban population can be made only in those two States, viz., New Hampshire and Massachusetts, whose population by minor civil divisions has been announced by the Census Office. The population by counties of all the States has, however, been made public. A comparison of these county figures with the approximately correct statements of the population of all cities of over 10,000 inhabitants, furnished by the Census officials to the newspapers, shows that it is not in New England alone that the rural population is less to-day than it was ten years ago. In considerable sections of every State (West Virginia excepted), north of the southern boundaries of Virginia and Tennessee and east of the Mississippi, and in the States of Iowa and Minnesota west of that river, there are more or less extensive tracts which have fewer inhabitants, outside of the corporate limits of cities having in 1890 a population of 10,000 or upwards, than they had a decade ago.

From Schoodic Lake, on the eastern borders of Maine, to Decatur, Ala., is about thirteen hundred miles as the crow flies. It would be possible, in going from one of these points to another, to travel nine miles in every ten through counties the population of each of which, outside the bounds of their cities, has decreased in the interval between the tenth and eleventh censuses. From the New Brunswick border to the western line of Livingston County, New York, the only county not showing a decrease through which it would be necessary to pass, would be Sagadahoc County, Maine. After having crossed Allegany, Cattaraugus, and Chautauqua Counties, New York, each of which has a larger population than in 1880, the route through the counties with dimi-

nishing rural population could be resumed and uninterruptedly continued, except while crossing a corner of Butler County, Ohio, and while passing through Allen County, Kentucky, and Macon County, Tennessee.

The inhospitable soil of New England is usually assigned as one of the principal reasons for the desertion of its smaller country towns. Such a cause does not exist in New York; yet, outside of the cities of over 10,000 inhabitants, the State of New York above Harlem River has 13,000 less population than it had in 1880. Of the fifty-five counties into which the mainland of New York is divided, thirty-four have fewer inhabitants outside of their cities than they had when the tenth census was taken. There has been an increase in the nine western counties, in Westchester, Rockland, and Orange Counties near New York city, and in five of the counties lying wholly or partially in the northern wilderness, so that the decrease has been most marked in the rich and fertile counties of the central portion of the State. The same causes which have led to the falling off in the population of rural New York have operated in the adjoining counties of northwestern New Jersey and northeastern Pennsylvania, in the former of which the Counties of Sussex, Warren, and Hunterdon, and in the latter those of Susquehanna, Wayne, Monroe, and Pike, show a decline in population.

The rapid growth of the many smaller manufacturing towns and villages scattered over the two States last named is probably the reason why no such general and extensive decrease of extra-urban population as is apparent from the county statistics of New York can be detected in them. In northwestern Pennsylvania, in the Counties of Erie, Crawford, Mercer, Venango, Armstrong, and Clarion, begins another tract with diminishing rural population. The tract extends with scarcely a break diagonally across Ohio and southeastern Indiana, and through central Kentucky and Tennessee, until it terminates in northern Alabama.

Of the eighty-eight counties of Ohio, thirty-six outside of the cities have lost population. Of these thirty-six, thirty-three are comprised in one tract of very irregular outline extending from the Pennsylvania line, a short distance south of Lake Erie, to the Ohio River, a few miles above Cincinnati. The greater portion of this tract is situated south of the fortieth parallel. Of the thirty-three counties which lie wholly or in greater part in this portion of the State, twenty-three have less population than they had ten years ago. Omitting Hamilton County (which contains Cincinnati), the population of this entire section of Ohio, outside the corporate limits of the cities of ten thousand inhabitants, is six thousand less than in 1880.

Not quite so large a proportion of the area of Indiana shows a diminishing population. Of the ninety-two counties, however, twenty-seven have, outside of the cities, a smaller population than in 1880. More than four-fifths, or twenty-two, of these counties lie in the southern half of the State, and principally in its southeastern corner, where only Hamilton County separates them from the Ohio group of diminishing counties. Of the eighteen Indiana counties south of the fortieth parallel and east of the eighty-sixth meridian, thirteen have lost population in the decade; and the eighteen taken together have, if their cities be excluded, fifteen thousand less inhabitants than when the tenth census was taken. For some reason, the majority of the Ohio River counties in both Ohio and Indiana show a diminished population. Out of the twenty-seven counties of Ohio and Indiana lying along the Ohio River, thirteen have decreased in rural population. A similar though less marked tendency manifests itself on the southern or Kentucky side of the river, in which, out of twenty-one counties lying opposite Ohio or Indiana, ten have less population than they had ten years ago. Twenty-seven out of the one hundred and nineteen counties of Kentucky are less populous than they were a decade since. As already stated, ten of these are along the Ohio River, and the remaining seventeen extend across the centre of the State to the Tennessee line.

In Tennessee only one-sixth of the counties, or sixteen out of ninety-seven, show a loss, after allowance has been made for the changes in county boundaries. Most of these are in middle Tennessee, and form a continuation (with a slight break just south of the Kentucky boundary) of the great belt of declining counties which extends from Lake Erie to the Tennessee. Limestone County, Alabama, forms the southern extremity of this tract.

In southern Michigan, and extending into the two northeasternmost counties of Indiana, is another but much less extensive "area of depression." Of the eighty-four counties of the State, seventeen, all in the southern peninsula, show a loss. Sixteen of these seventeen are among the twenty-eight counties lying wholly or partially south of the forty-third parallel. The remaining county, Montcalm, showing a loss, lies immediately north of this parallel and adjoins the other retrograding counties.

But eight of the sixty-eight counties of Wisconsin have experienced a loss of population. Of these, five—Ozaukee, Sheboygan, Washington, Dodge, and Fond Du Lac—lie together in the eastern portion of the State, to the north of Milwaukee. The other three form the northeastern portion of perhaps the most interesting of all these areas of decreasing population. This area extends along both banks of the Mississippi and for a considerable distance inland. On the east or left bank it begins at the mouth of the Wisconsin River, and stretches southward to the Kaskaskia, with an irregular depth usually of between fifty and a hundred miles back from the river. It includes the three southernmost counties of Wisconsin and that portion of the State of Illinois lying west of the eighty-ninth meridian and north of the thirty-eighth parallel. In this section of Illinois are included the whole or the larger part of forty-nine of its one hundred and two counties. Of these, thirty-three show a loss of rural population, and the entire forty-nine, taken together, with the three southwestern counties of Wisconsin, have about 26,000 fewer inhabitants than in 1880. The area of this tract on the east bank is over 30,000 square miles. On the west or right bank of the river it begins further north in Minnesota, at the Cannon River, and includes the seven southeastern counties of Minnesota. It extends southward to the southern boundary of Iowa. Its western boundary is usually in the neighborhood of the ninety-third meridian, although in some places it is a good deal to the east and in others as much to the west of that line. Taking, however, the section of country bounded by the Cannon River on the north, the Missouri line on the south, the Mississippi River on the east, and the ninety-third meridian on the west, we have an area of some 28,000 square miles, including seven counties in Minnesota and forty-three in Iowa, of which all the seven in the former State and twenty-six of the forty-three in the latter show a decrease, the net loss being about 24,000. On both sides of the river this tract includes portions of four States, and comprises some 58,000 square miles, or nearly as much as all New England; and the net decrease in population outside of the cities is about 50,000. The decrease in Iowa is especially noticeable, both because of the relatively large proportion of the State over which the decrease extends, including thirty-three out of its ninety-nine counties, the frequently high percentage of the decrease, reaching, as it does in some counties, 15 per cent. or more, and the comparatively recent date at which the State has been settled.

Of the South Atlantic States, only Maryland and Virginia show any noteworthy decrease, although there are a number of counties scattered through the States of North Carolina and Georgia in which there has been a loss in population. Of the twenty-three counties in Maryland, nine have fallen off. The most noticeable decrease is in the four southern counties of the Western Shore, the loss in these four counties footing up 5,500. In one of them (Charles County, on the Potomac River below Washington), the shrinkage has amounted to 18 per cent., and the county now has but 75 per cent. of the population it had a century ago. The rich agricultural regions contained in the Counties of Washington and Frederick, in western Maryland, and in those of Cecil, Kent, and Queen Anne's, on the eastern shore, exhibit a similar phenomenon. In Virginia the losses are confined entirely to the counties east of the Blue Ridge. Every one of the thirty-one counties west of that range, as well as all of the counties of West Virginia, have increased. Of the sixty-nine counties east of the mountains, almost exactly one-half (or thirty-four) show a decrease, which has, however, not been as general in the tide-water region as in the midland and the Piedmont sections of the State. Of the eleven counties lying along the eastern slope of the Blue Ridge, no less than nine have lost population.

From the data even now available, it is evident that the strictly rural population is

decreasing in many extensive portions of the most fertile land in the Union. When we can separate the population of the towns of between 2,000 and 10,000 inhabitants from that of the rural districts proper, unquestionably the decrease will appear to be still more widely extended in area and proportionately greater in amount. Assume that ten, twenty, or thirty years ago any particular region was cultivated as closely as it is to-day, a decrease of its rural population is inevitable, for not only will the improvement in agricultural machinery enable the same work to be done by fewer hands, but the improvement in the means of transportation and the lessening of its cost, the greater and greater development of the factory system and the replacement of the small factory by the large, will compel more and more of the mechanics who formerly lived among the farming population to migrate to the cities and manufacturing towns.

A greater or less decrease in the rural population of many portions of the country is therefore to be expected. Whether the census does not make that decrease appear to be greater than it is, may, perhaps, be an open question. Most of the complaints as to the omissions of the census have come from the cities of the country, and have been largely inspired by civic pride or vanity. It is not improbable that the omissions were really greater in the rural districts. In the cities, an average man, by working hard, could make, as enumerator, a moderate—although a very moderate—wage. In the country, the best of men frequently could not. At the rates paid, and with the enormous number of questions, especially on the agricutural schedule, to be asked, good enumerators in one of the most thickly settled agricultural regions in the Eastern States could frequently not make more than a dollar and a half or two dollars a day, and out of that they were required to furnish their own team and feed it and themselves. Under such circumstances the temptation to skim over their districts and to slight remote corners of them, must have been too much for the not too Spartan virtue of the small politicians who largely made up the enumerators.

TRUCK-FARMING.

For the first time the industry known as truck-farming has been made a subject of census investigation. Within the past twenty years this infant industry has grown to be one whose extent may be gauged by some of the figures presented in a census bulletin. Upwards of $100,000,000 are invested in truck-farms, aggregating over half a million acres of land, the annual products of which (after paying freight and commissions) amount to $76,517,155, and require the services of 230,893 persons, aided by 75,866 horses and mules, and $8,971,206 worth of farm implements and machinery; the income of this comparatively new traffic, after paying for labor, fertilizers, and seeds, is estimated at $52,000,000.

A distinction is made between truck-farming and what is known as market-gardening. The latter specialty belongs to small holdings within easy driving distance of cities and towns, while truck-farming is defined as the production of green vegetables on tracts remote from market, the truck-farmer being dependent on water and rail transportation for the delivery, and on commission-men for the sale, of his products. For statistical convenience, the country was divided into twelve districts—New England, New York and Philadelphia, Peninsular, Norfolk, Baltimore, South Atlantic, Mississippi Valley, Southwest, Central, Northwest, Mountain, Pacific Coast. Previous to 1860, Long Island, New Jersey, Delaware, and southern Illinois were the chief truck centres, but to-day over 75 per cent. of our vegetables come from the South Atlantic States, the Mississippi Valley, the celery districts of Ohio and Michigan, and from the Pacific Coast. A very considerable portion of the truck products consumed in our great cities is grown from 500 to 1,500 miles away; and favored localities, more particularly at the South, devote their energies to the growth of special varieties of green food, for which there is a steady demand throughout the year. "Late in the fall and early in the spring, Florida and the Lower Mississippi Valley supply the Eastern and central cities, and California those of the far West and mountain section, until the advancing season, *at the rate of thirteen miles a day*, starts the growth and consequent supply up along the Atlantic Coast and the great Mississippi Valley, when the full season of midsummer in the North continues the supply, until winter frosts once more compel a return to the South, where a fresh crop awaits the demand of the market."

New potatoes, cabbages, cauliflowers, and tomatoes are as yet the only vegetables shipped from California so far east as St. Louis, Kansas City, and Chicago, and then only in small quantities to meet a partial failure of crops in the Mississippi Valley and Florida. But the law of natural monopoly has shown itself in the past, and cannot fail in the future. With rapid development of railroads come fast trains and lower freight and express charges, and these artificial advantages will enable California, with a fertility of soil that produces every green thing to perfection, and a climate largely free from the winter frost that occasionally proves so disastrous at the South, to compete sharply for much of the truck trade beyond the Mississippi. It has been only a few years since the truck-farmers of the Norfolk and Baltimore districts have successfully divided patronage with the older and more Northern districts, yet already Norfolk growers grumble over signs of a shifting trade, because growers in Florida are severely pushing their Maryland and Virginia rivals. An estimate made in 1879 placed the value of the vegetable and berry crops shipped from Norfolk at $1,757,645, while for the census year ending June, 1890, the value of the vegetable crop shipments alone rose to $5,773,467; in addition there were handled at the same port nearly 900,000 melons.

"The average melon fields of the South Atlantic States yield about 400 salable melons per acre; 1,200 will load a car, which will sell at the North anywhere from $150 to $275, leaving net returns from nothing up to $150 per car. One gentleman in Dawson County, Georgia, reports making a net profit of $1,700 from thirty-two acres in 1889." Over 114,000 acres are devoted to melon-raising in the United States. A crop that has gained in value of late years in the Southern districts is sweet potatoes; these now return a handsome profit, in some cases as high as $100 an acre on farms which formerly barely met expenses. One owner of 300 acres near Cape Charles, Va., cleared $20,000 last year from his truck, or over 25 per cent. on the investment; such a return was only rendered possible by recent favorable railroad facilities. The small section, Mobile County, Alabama, shipped during the past three years $1,629,964 worth of truck; other Southern distributing points, such as Savannah, Charleston, Jacksonville, etc., supply equally significant returns.

In the South Atlantic and Mississippi Valley districts many freedmen are engaged in this industry; they own their own farms and teams, and successfully rival their white neighbors. Some of the special reports filled out by these negro truckers prove thorough grasp of their business on both the practical and commercial sides. One, selected for print, shows an average net income per acre varying from $75 for cabbages and $50 for asparagus down to $25 for watermelons, a crop which is more prolific, but less remunerative, at the South than in other districts. The remarks appended to one report are a good answer to much cheap talk about the negro of the South: "Total number of acres, 47; value per acre, from $100 to $150; number of men employed during trucking season, 5; average wages per day, 65 cents; number of horses and other animals employed, 4; value of implements used, $75; total amount paid for labor annually, $425; total amount paid for fertilizers, $1,425; total gross income, $4,627; total net income, $2,423."

The leading classes of vegetables raised by truckers—in contradistinction to market-gardeners—are as follows, ranking in acreage in the order named: Watermelons, cabbages, peas, asparagus, melons (other than watermelons), sweet potatoes, tomatoes, spinach, Irish potatoes, celery, and string beans. The net returns from the same crop, in the different localities, vary materially. For instance, the highest net profit per acre reported for tomatoes is $300 in the New England, the lowest ($20) in the Northwest district. The New England district also returns $2,000 per acre as profit on cucumbers (this enormous profit results from their culture under glass at great expense), as against $25 in the Norfolk district. On the whole, it seems that while the Northern districts report a larger return per acre for certain of the truck staples—such as beets, celery, spinach, and tomatoes—the South shows a high average profit on all varieties, with a larger aggregate of land and labor employed in trucking. In a word, the centres of truck-farming are moving southward and westward.

A SOUTHERN ARCADIA.

BELLE HAVEN, Va., April 6, 1891.

A FEW hours by train or boat from New York or Philadelphia or Baltimore bring the traveller to the oft-mentioned and seldom-visited Eastern Shore of the Chesapeake Bay, haunted of oystermen, beloved of crack shots, but as yet innocent alike of summer boarders and of tourists. It is a region not now discovered for the first time. Cabot may have sighted it in his voyage of 1497. Cape Charles, its southernmost point, was in 1607 named for Prince Charles, later Charles I.; and the picturesque names of some of the towns, as Princess Anne, perpetuate English history. In this district, attractive from its history to the student, from its climate and light soil to the pedestrian, I have been spending the week in spring which seems intended for the exploration of out-of-the-way corners of the eastern sea-board.

Small as is the region—the area is but six thousand square miles—it has been a field of contention among three States. From the Eastern Shore Delaware was carved out of Maryland, and the southermost point was most unjustly added to Virginia. The two Virginian counties of Northampton and Accomac occupy Cape Charles, a peninsula about seventy-five miles long and perhaps ten miles wide upon an average, but so penetrated by creeks both from the bay and the ocean side that only a narrow isthmus of solid ground is left between. Through this backbone of the cape runs the railroad from Wilmington to the Norfolk ferry; but let not the passenger suppose that he has seen the Eastern Shore as he is whirled rapidly through swamps and thick woods, with fleeting views of distant farm-houses. The railroad at present occupies the least populous part of the peninsula, and touches no old town in Virginia. He who would see the country must follow the roads. The side paths are firm for walking, and would probably answer for the cyclist; and driving is everywhere practicable. Nowhere does one find long stretches of unbroken forests; the country is fertile, and the blossoming peach trees fill the eye with beauty.

One does not go to the Eastern Shore to see fruit trees so much as to see the people and their ways. As you start out from the little harbor of Cape Charles and follow the clean shell-road north past the high fragrant pines, or under overarching trees, there is at first little to suggest that you are not in New England. Presently you find yourself in the midst of those sociable little woolly black pigs for whose benefit the miles of whitewashed fences and the more numerous miles of Virginia worm fences of pine rails seem to have been provided; and, as you advance, a new quarter of the world opens up.

The houses are novel. One is, of course, struck by the outside chimneys of the older places and by the numerous small outhouses which the Southern farmer seems to think essential. Old houses are rare, and I have nowhere found such a colonial mansion as may be seen in almost any seaport town in New England. The broad Southern verandas, too, are almost wanting; but one soon comes to recognize as characteristic of the region certain well-built houses with brick ends and graceful gambrel roofs, embellished with rows of dormer windows. Many of the older houses have been built over, and the great chimneys have been demolished to make foundations and the inner chimneys for close stoves, which are unfortunately taking the place of the generous old wood fires. Occasionally, though very rarely, there are handsome brick houses; and everywhere one sees a peculiar brick arch, supporting a solid platform, which is roofed by a portico supported by four white pillars. In but one place have I discovered a church which seemed to be more than thirty years old. This was at the village of Pungoteague. It is built of large red brick laid in Flemish bond. The projecting ends are adorned with a coarse gray glaze, so that the front of the building presents a pleasing tesselation of gray and red. I had no opportunity to learn its history. The villages are composed chiefly of new buildings, but are not remarkable for neatness. It has not been my fortune to see the inside of many of the houses. One of them which I entered was a comfortless place except for the great corner brick fire-place. Even there I was most interested in the negro family which occupied it and had furnished it with a curious medley, including a handsome old mahogany bureau.

More than all else the negroes remind one that he is in a different region. In Northampton County they are 6,000 to 5,000 white; in Accomac they are but 11,000 to 17,000; but the negroes whom one meets upon the road are far more numerous than this proportion would suggest. They are of all sorts, from the trim preacher in his well-found top-buggy to the boy driving a discouraged little two-year-old steer to one of the big carts which the negroes much affect. From young and old, from the fat old mammy, with her basket of provisions and her head wrapped in a bandanna, to the little school-children, one meets with perfect civility and politeness. Nowhere have I seen more genuine and unaffected good-will, kindliness, and courtesy than among these colored people. Only once did I meet with a case of that stupidity which the reader of Olmsted's books would expect to find. It was in a stalwart oysterman in his big boots, of whom I asked the distance to Eastville. "'Bout seven miles," said he; "'bout seven miles. Yes, I could walk there in an hour, sure. Yes, I could get there by four o'clock, sure." It was then half-past one, and the distance, with which he was familiar, was perhaps three miles. I have always been inclined to distrust the stories of the gayety of the negro race, but, in passing along the roads, again and again was my ear charmed by the song of men and women in the fields. Occasionally a courtship was going on, shouted half across a potato-field; and once I saw a circle of little children gathered together with their heads covered, singing in weird fashion—perhaps playing camp-meeting.

Throughout the sixty miles' walk everywhere new negro houses abounded; not cabins, but substantial weather-boarded houses, often two stories in height, and each surrounded by a little patch of land. It was the universal testimony that most of the negroes bought land and built upon it. One white man said they were able to do so because so many of them received pensions from the Government. It is certain from the testimony of the whites that on the Eastern Shore the race problem has been almost completely adjusted. In a region in which slavery flourished for nearly two centuries and a half, the races now live together on terms of amity and friendship, of mutual respect and good-will. The social separation is very sharp, and almost all the trading is done by whites; the only industry, even in the villages, in which, so far as I could see, colored men engaged, was the establishment of low bar-rooms. Race difficulties simply do not exist; the negroes almost invariably vote the "Union ticket"—that is, the Republican—and Northampton County usually elects Republican officers. Few negroes are sufficiently educated to take office, and one lady bitterly complained of the presumption of a young negro who had succeeded in obtaining admission to the bar and was likely to put himself forward for "Commonwealth"—that is, for county prosecuting attorney. The general testimony was that the negroes sent their children to school [illegible]ter than the whites, and that the steady ones were excellent citizens. There was some complaint that negro laborers could not be depended upon to work more than a few days a week, enough to keep body and soul together. Farm laborers are in great demand, and receive ten to twelve dollars a month and board.

Perhaps these happy conditions are due to the great prosperity of the whole region. Tobacco seems almost an unknown product; the dependence of the country is upon "early trucks"—that is, vegetables for the city markets—sweet potatoes, and especially "round" potatoes. Large quantities of these products go to Boston, with which there is a certain relation of travel: I met several whites and blacks who had lived in New England. The white men are hardly distinguishable from the similar class in New England or Middle-State towns. Many of them are established as traders, and the stores throughout the peninsula are very numerous. Except by a difference of accent, the loafer, the dapper clerk, and the all-pervading drummer are not distinguishable from the same classes in New England. The farmers—for there are no "planters" on the Eastern Shore; the word farmer seems to be universal—show less energy. But the simple fact that in my journeyings I have yet to see a single ruined house, and can remember but two dwellings which seemed to be unoccupied, shows how profitable must be their calling. Land is worth half as much as similar land would bring in northern Ohio. It is said that a million dollars was received from the "round" potato crop in Accomac County last year. The result is a remarkable growth, not only of the new railroad villages, but of the old towns like Onancock. Another evidence of prosperity is the excellent living which the country affords. Such oysters, such poultry, such potatoes, such Maryland biscuit as the hotel at Belle Haven affords are not to be had in any city market. On the other hand, the guest at the Grand Central Hotel at Onancock sees something of the old slavery times in the two slatternly, ragged, and unpleasing negro girls who serve the table with somewhat indigestible food.

In no part of the Union have I seen greater evidences of prosperity and content than on the peninsula of Cape Charles. The races live side by side without friction and with pleasant relations; wealth increases from year to year, and is widely distributed; no foreigners have come in to create or to participate in these advantages. Such as it is, the Eastern Shore of Virginia is a bit of American soil peopled only by Americans.

ALBERT BUSHNELL HART.

IRELAND ON THE CENSUS DAY.

DUBLIN, April 6, 1891.

WITH time, we realize more fully the extraordinary character of the split that crushed Irish hopes and shattered the Irish party in the early days of last December. There is nothing similar recorded in history. When great differences have arisen, there have always been some previous indications, some tendencies of mind, some seeds of thought already sown, some sectional interests already apparent,

hoping to enlighten as to the reason of the course taken by each man. In this instance, persons who had worked together harmoniously in a common cause for a lifetime, became instantaneously bitterly opposed to each other. Result as it may, this divergence adds an unexpected sombreness to life, seeming to undermine all firm standing as to bases of belief and judgment and political thought. After the divorce revelations, Mr. Parnell's infamous abuse of his colleagues, his attack on Mr. Gladstone, his language at Kilkenny and Sligo, I could hardly be more surprised at the adherence of many excellent individuals to Mr. Parnell than I should be if they had attempted to justify petty larceny—some, indeed, have gone so far as to defend and excuse the late brutal assault on Mr. Healy. But such is the fact, another of the numerous, unexpected, inscrutable developments marking Irish history, in which nothing appears certain except disappointment and unrest. The present contest is now fully joined, and there can be no appreciable change in party relations until after the general election. Not even the release of O'Brien and Dillon in August will make any material difference. Their undecided action at Boulogne has considerably lessened their importance. While they retain the respect and love of their fellow-countrymen, and while their adherence to either side would still doubtless be a source of strength, and their retirement from the scene would gratify the adherents of the Government, the preponderating influence they might have exercised early in the struggle is no longer theirs.

The National party started under serious disadvantages. The organization of Ireland was in the hands of the Parnellites. The daily paper that for a generation had led and mirrored National sentiment was unreservedly with Parnell. Perhaps no journal in either England or the United States occupied the same commanding position in proportion to its circulation as the *Freeman's Journal* in Ireland. Catholic and a clerical organ, it has now committed itself to a life-and-death struggle with the Church. While the Parnellite members adopted a course that excluded them from all the privileges attendant on London political life in alliance with a great English party, and most of the anti-Parnellites seemed to deprive themselves of all means of living, the *Freeman's Journal* adopted a course that has called into the field a powerful rival and reduced its shares from £7 to £4 10. Irishmen on this occasion cannot be accused of acting from sordid motives. It may be one of our defects that we are too little swayed by prudential considerations. Within three months a new daily paper, the *National Press*, has been started in opposition to the *Freeman's Journal*. It has secured the finest premises of any newspaper in Dublin. The machinery, second-hand, picked up on the moment, is still defective, and the staff, hastily got together, is not yet fully trained, so that the position the new daily is likely to take in the newspaper world remains uncertain. As Mr. Parnell would have had all his own way but for some such paper, the initiatory shortcomings may well be pardoned. A few days after the appearance of the *National Press*, the Irish National Federation was inaugurated at an enthusiastic and representative gathering in Dublin. It is intended to take the place of the Irish National League, now in the hands of the Parnellites. The Federation can hardly espouse the cause of coerced and evicted tenants, as did the League in its palmy days. And if, without espousing that cause, the Federation attain to anything like the former influence of the League, it will succeed in doing what no purely political organization has effected since the famine of 1846. If, as seems probable, the agrarian combinations cannot be maintained, and if the people conclude that little more directly affecting their pockets is to be gained from politics, the much-disputed question will be finally settled as to the extent to which, apart from the land, Irishmen really care for home rule.

The present is a trying ordeal. It is, however, in the interests of Truth. In spite of shouting, swaggering, and threatening, not free from violence on both sides, the way is being cleared for her to assert her supremacy. What else should we desire? Where the large funds necessary for the next general election are to come from, is a problem. The Land League ten years ago was established mainly on money drawn from the States and Australia. Beyond the maintenance on small allowances of some of the Irish Parliamentary party (a maintenance drawn chiefly, it is understood, from finances banked in Paris), election expenses in Ireland were but trifling. Mr. Parnell's nominees were invariably returned. The certainty with which they held their seats gave a peculiar force to the party. This easy state of affairs is ended. The country, never rich, lavishly supporting its own religious institutions, and having with a diminishing population almost every year raised some £30,000 or £40,000 for one political purpose or another—for Mr. Parnell, evicted tenants, legal expenses, or the establishment of a newspaper—must now be considerably impoverished. To fight the battle out fully will cost not less than £50,000 on each side. As yet, within a month, the subscription lists in the *Freeman* and the *National Press* show collections of only £1,500 and £3,500. An ominous proportion of the latter sum is from clerical contributors.

The attitude of the ascendency papers and the action of the Conservative electors at Sligo show that the Government party in Ireland is determined to throw its weight into the scale with Parnell and the Hillside men. There is no concealment regarding the alliance. The secretary of a Liberal Unionist association in Ulster lately told his near relative, a friend of mine, that if he had fifty votes, he would cast them for the Uncrowned King. This is doubtless good party tactics, but it is a course which those who profess to desire good order in Ireland would not dare to follow if they felt themselves responsible for the conduct of their own government. It is a suggestive commentary on the system under which we here live, illustrating the extent to which so many Irishmen regard politics as a mere joke, a recreation, or a means of advancing their own interests apart from all considerations of public welfare. The present juncture cannot but seriously endanger our prospects at the English polls. The violence at recent Irish elections—all unnoticed as such conduct would pass in Englishmen—the mutual implications and vilifications of the controversy, must tend to lower Irishmen in the estimation of Great Britain. Philosophically considered, in the minds of men like Gladstone, Morley, Earl Spencer, Mr. Bryce, and the writers in the *Speaker*, the necessity for home rule is more than ever apparent. But how will the subject be regarded by the average English electors, reared in anti-Irish and anti-Catholic prejudices, influenced by the Primrose League and by able and insistent witnesses from Ireland such as Mr. T. W. Russell? For the present the full combination of English and Irish home-rule advocates on English and Irish platforms appears at an end. The offices of the Irish Press Agency in Westminster are closed for want of funds, and its staff is scattered. The revulsion against political thought prevalent here, leading men to curtail their newspaper reading, and banishing Nationalist portraits from photographers' windows in our principal streets, must act with additional force on the other side of the Channel.

It is twenty-one years this spring since the home-rule agitation was started by Mr. Butt. Never during that period were there so few Protestants of standing prominently connected with the movement as there now are. The Government is improving its opportunity with consummate tact. Its adherents were never in better spirits. It claims to its account the increased contentment and prosperity resulting from the land legislation conceded by the Liberals or exacted by the Irish party. No Englishman for half a century was so popular with the classes in Ireland as is Mr. Balfour. His portrait is for sale in the leading Dublin bookseller's window, where I do not recollect ever to have seen a portrait before exposed. The success, on the whole, of his relief policy in the west is assured. He has lately given singular proof of the strength of his position, and done what a Liberal or Home-Rule Government could hardly have ventured in the face of English and northern Protestant opinion, in trying before a coercion court and imprisoning two Protestant clergymen for "obstructing the thoroughfare" by street preaching in Arklow. Yet, to the majority of Irishmen, the hatefulness of his arbitrary sway was never more apparent than at the late Cork trials of men who had been savagely batoned by the police for asserting their right to enter their own court-house at Tipperary.

During my life-time millions of square miles of desolate places have been portioned into States and colonies, and accorded by great Powers freedom and self-government; while Ireland, a fertile country, inhabited by an ancient people who have acquired influence in every other corner of the globe, is held in a condition of intolerable subjection. To-day the census of her population is taken. It will show a decrease within the last decade. It will not amount to more than half what it indicated when I was first numbered among her inhabitants. That the present diminished population is less impoverished than the former greater one, is no sufficient compensation. There is not another nation on the face of the globe that has not, within the same period, increased both in population and in comfort and riches. Let who will be content with such a state of things. Census-day brings pride and joy, or at least satisfaction, to most peoples, but to us humiliation. Well may we, as Irishmen, abhor the present system of misrule, in going over Charlemont House and seeing the perfect preparations made for the enumeration, when we reflect on the hopes that centred there one hundred years ago, on our subsequent history, and the record of decline to which it seems doomed. However, it is well to remember that if in Irish affairs hope is often cheated, the worst forebodings are generally belied.

D. B.

THE MAFFIA ONCE MORE.

ROME, April 2, 1891.

THE tragedy of New Orleans makes the nature of the great Sicilian order of outlawry of more than ordinary interest, and I have taken pains to find what is the best Italian authority on the matter, so as to give a picture of it

which cannot be put down as the outcome of foreign ignorance or prejudice. Nobody can have travelled in the island of late years in leisure without having, here and there, discovered the proofs of the insecure state of society; but in justice to the Sicilians and their perception of the advantages to be derived from making an exception to the foreign visitors in their operations, I must say that foreigners are not the victims of their illegalities, and a European traveller may go, as I have gone, through districts where the population was continually overawed by the outlaws, without the least inconvenience. The old-fashioned brigandage, which owed its terrors to the sequestration of the person and the certainty of death if the required ransom was not forthcoming, has disappeared, I believe. The single case of it in late years resulted in the capture of so many of the criminals that a repetition of it is not likely, and that form of the activity of the Maffia may be studied as historically interesting, but not as showing the laxity of Italian policing.

The Maffia is not a single, formal, and organized association like the Camorra of Naples, but a state of society, existing in every part of Sicily, which is in revolt against the law, combines in any convenient manner to defeat it, and lives on the contributions it can levy on the industrious part of the community. In certain districts it forms bands, bound together for certain forms of crime and limited to the section, and these are regulated by their statutes and pay absolute obedience to their chiefs; but the general condition of the Maffia is that of a large number of people connected by no formality, but recognizing each other by certain characteristics, forms of speech, and to a limited extent by a slang, but mainly by the general deportment, and who invariably assist each other in any undertaking, legal or illegal, and as invariably combine for the mutual defence and misleading of justice. The religion and morality of the Maffia, if it is permissible to apply the terms to the inversion of our usual acceptation of those notions, is contained in the rule of conduct known as *omertà*, a word translated by some of the writers on the subject as humility, by others as manhood, and which is thus described by Prof. Tommasi-Crudeli:

"So it has come that little by little have obtained in the habits of the entire population the principles of a special code which is called *omertà*, which establishes as the first duty of a man that of doing justice with his own hands for all injuries received, and stamps with infamy and holds up to public execration and vengeance whoever has recourse to the tribunal or aids it in its investigation. On this account even the honest populace considers it a good work to hide an assassin from justice, or refuse to give evidence against him."

With these principles pervading the population (and they have a large currency in the entire population of southern Italy), the Maffia has a soil propitious for its operations. Bonfadini, in the 'Report of the Committee of Inquiry into the Condition of Sicily,' describes the Maffia as "not exactly a secret society, but the cultivation and perfection of domination directed to all evil ends; the unity—instinctive, brutal, selfish—which binds for the detriment of the State, the laws, and the regular organizations, all those individuals or social ranks who prefer to gain their livelihood and their pleasures, not by work, but by violence, cheating, and intimidation." And Franchetti, in his study of the island, 'The Economical and Administrative Condition of Sicily,' says that it is "a union of persons of every class, of every profession, of every description, who, without having any apparent regular and continuous tie, are always agreed in promoting their mutual interests, without any consideration of law, justice, or public order. It is the mediæval sentiment of one who considers himself able to provide for the protection and safety of himself and his interests by his own powers and personal influence without regard to the authorities or the laws."

The Maffia draws its profits from every transaction in which the Sicilian is interested. If an auction sale is to take place, the intending purchaser is informed by an insignificant-looking individual that either some "man" has a desire to purchase the object in question, or that if he wants it at a reasonable price he would do well to remember the poor; or by some similar injunction is notified that he must buy off the Maffia by a proportional contribution, in default of which he is outbid, but paying which he has no competitor and gets it at his own price. If the occasion is an election, the candidate of the Maffia has a swarm of clients who advise people not to oppose him, lest disagreeable things may happen, and the advice is understood. If it is a matter of a contract for some public work, the payment of a commission to the Maffia is necessary to secure the contractor from all interference or competition. The majority of the population, distrusting the power of the law to protect them against the secret action of the Mafiosi, obeys the secret injunction and preserves silence, no matter how oppressive the tyranny. In case one of the Maffia has committed a murder, or any offence of minor degree, it is the duty of the affiliated to prove an alibi, to bribe the jury or overawe it, and prevent a conviction, or, failing in this, to punish the refractory and honest juryman or witness, by killing his cattle, if he has any, burning his forest or farm-house, boycotting his business if a citizen, or finally assassinating him—for the refusal to obey the Maffia must be prevented at any cost.

The Italian governments, one after another, have proved unequal to the entire repression of this organized illegality, this State within the State, defiant of all law and measures of police. The reason is that the governments have never dared attack the "high Maffia" (for this distinction exists everywhere).

"The distinction is made between the high and the low Maffia, Maffia in bonnet and in yellow gloves; but it is relative, being the distinction between protector and protected, patron and client, him who orders and him who executes, as is shown by the following extract from a letter from the late Prince of Galati, than whom no one knew better the historic and political conditions of the island: 'Leone, Nobile, and their companions, victims of the high Maffia, are dead. To-morrow there will be new instruments and new victims. Looking over the history of Sicily, do we find a single brigand who did not die on the gallows or by a bullet? All, beginning with Giangiorgio Lancia, hanged in 1582, and ending with Leone, killed in 1877, have had violent deaths; not one has died unpunished. The high Maffia has been spared by all the governments, beginning with that of Don Arrigo Guzman, Count of Alvarez, and ending with that of Nicotera. . . . It is true that Nicotera admonished a few barons; trivial punishment, illusory penalties. The high Maffia is intact. It has thrown to the police its agents in the country, but keeps those of the city.'" (G. Alongi, 'La Maffia': Turin, 1887.)

The wealthy are Mafiosi for the protection of their estates and herds, the poor from envy and want.

"For many of the rich, to be of or acquiesce in the Maffia is, if one may believe them, a necessity. But are there not many who take it up from taste or interest? Many, and I do not know if most belong to the former or the latter. The same necessity weighs on the peasant. In fact, while he is honest and laborious he is oppressed, insulted, prevented from attaining an independence, badly or half fed, worse lodged. If, on the other hand, he commits a couple of crimes, generally with impunity (the witnesses for the accusation being few, and those for the defence many), the obscure creature of yesterday has become noted, become a man of honor. The *gabelloto* [farmer of an estate] who has always a staff, a guard of honor of proved Mafiosi, and who has always treated him as a nobody, takes him into his esteem, partly from fear, partly from an eye to his services; protects him, and often, of the mere laborer, makes a formidable champion with a salary. And so the new criminal finds himself suddenly elevated morally and financially; the crime that was for him a reprisal or a necessity, has become a virtue and a convenient habit; inducements increase, and contact with the other Mafiosi does the rest." (Alongi, *ibid.*)

The great mass of the Mafiosi are the manutengoli, those who take the passive office of hiding, feeding (if need be), and protecting from the investigations of justice, the active agents of crime. Without the manutengolo the Maffia could not exist, but with him the criminal passes the tribunal unterrified.

"His work begins in the investigations, throwing, as the saying is, 'sticks between the legs' of the judges to divert them from the clues. False witnesses, anonymous communications, articles in journals—everything is brought into action to weaken the charge or break it down; and if the magistrate be persistent and send the man to the assizes, there is a new series of evolutions and intrigues which end only with the verdict—not always conformed to justice. These begin with the examination of the jury-list, seeing who must be rejected and who accepted. With these latter all the friendly relations are employed to soften their hearts, and when these are not sufficient they are informed that the accused has many and powerful friends who would defend him *at any cost*, and if necessary *avenge* him, etc. If the accused was of importance in the Maffia, the friends added to the appeals for sympathy *for a victim of partisan hostility*, the information that he had a host of friends *ready for any measures* to save him; and those who did not feel convinced by the first plea were moved by the second, knowing that under the expression *ready for any measures* were conveyed threats of reprisal and vendettas not far away. And on this point the Maffia has given examples so terrible that no one attempts to resist. It is known that witnesses and jurymen, after an affirmative verdict, have been assassinated in broad day, even in the city." (Alongi, *ibid.*)

The trial is followed with the same care—friends in court and witnesses ready to swear to anything so that the witnesses for the accusation may be invalidated, the fabrication of false testimony being an art cultivated to the highest perfection; alibis well supported, etc.

"In this state of things, which still obtains, is it a wonder, is it a great error, if the masses attending the trials are convinced that to lie in court is not dangerous, while by offending the Maffia one risks his life? However much one may love truth and justice, however courageous one may be, the certainty of a vendetta, or even the probability of it, makes the best hesitating and reserved, the more so that with ambiguous phrases one may evade the law, keeping up appearances of legality, while, in fact, it is the Maffia which is obeyed and triumphs." (Alongi, *ibid.*)

When the Maffia is in the country, the malandrino is the chief and director of its operations. He is apparently a quiet proprietor or tradesman who never takes any part in the enterprises of brigand, highway robber, or bands of cattle-thieves, but spies the opportunity and gives information, and directs the movements of the active members of the organization. He receives the booty and sells it, and aids in every way the operations, protected by his wealth or position, and sometimes betrays his

confederates to justice, remaining sole possessor of their hoards. He is the worst and most dangerous criminal in the Maffia.

In some parts of Sicily only do the Maffiosi form bands, with statutes, oaths, and forms of initiation. These somet mes are at war with each other, but always combine to defeat the law. These brotherhoods levy blackmail, rob, and revenge offences on their friends or company. The assessments are made, and warnings given, at first with due form and moderation; but, if not attended to, are followed by more rigorous measures.

"Before having recourse to assassination for little matters, the means of intimidation are exhausted—cutting down trees, sending crosses, etc., etc.; but when it is a question of some one suspected of watching the association or bringing it into the hands of the law, or one who has done an injury to a brother or to a rival group of the Maffia, the only and infallible means of action is murder. This even becomes sometimes a means of gain, and is let out. Anybody who has an enemy whom he wants to have put out of the way, has only to apply to the brotherhood, which, for a price varying from 50 to 500 francs, charges itself with the matter. The common method of procedure is the following: 'When the chief has tried the victim [he being absent, of course], or has recognized that his offence merits the punishment, lots are drawn for the executioner, or the job is given to a novice to prove his courage and obedience. But the work is not intrusted to him alone; he at most only takes the weapon [the gun always] from the hands of a colleague, and fires at the victim, who is sometimes unknown to him. The shot fired, the gun is passed from one to another of the associates posted at short distances, and disappears as if by enchantment, while the murderer, making a rapid turn through the by-roads, may run to the scene of the murder as if he were only a curious spectator."

One writer on the Sicilian brotherhoods (Colacino, 'La Fratellanza') says:

"In it [La Fratellanza] the purpose of robbery as an end of common gain was eliminated. La Fratellanza was not an association of robbers—attacks on property might be a mode of vendetta, since this may be accomplished even by the destruction of his property; the thirst for blood was stronger than the desire of gain. La Fratellanza neither wished to rob for greed, nor rise against property, nor attack the form of government. To bathe in the blood of the enemy or insulter, with avidity, savagely, undisturbed—this was its ideal. Its maxim was: 'Sweet is wine, but sweeter still the blood of Christians.'"

This is the testimony of Italians who have studied the condition of Sicily, and the list is long. Official reports, studies of crime, investigations of scientists, both for public information and for pure science, all accord substantially in their relations of which I have but indicated a small part—that which most imports to the people of the States where the Maffia is likely to be planted. The following from Alongi is worth remembering: "Once the first nucleus of the brotherhood is constituted, it spreads rapidly, recruiting adherents among the criminals and evil-livers of every kind. This force of expansion, given the anthropological and historical circumstances of Sicily, is frightful." W. J. S.

Correspondence.

INDEMNITY TO FOREIGNERS.

To the Editor of The Nation:

Sir: "The Italian Trouble," in the *Nation* of the 9th inst., doubtless voices the sentiment of the country as to the cash value of Italy's loss at New Orleans; also in the statement that Blaine's answer to Baron Fava "is very neat and complete, and puts the whole case in a nutshell."

However, further on in the same article the *Nation* says:

"We do not know what Mr. Blaine means when he says that 'the United States has distinctly recognized the principle of indemnity to those Italian subj cts who may have been wronged by a violation of the rights secured by the treaty with the United States of February 26, 1871.' There was no such recognition in the case of the attack on Spaniards in New Orleans in 1850 or of the attack on Chinese at Rock Springs in 1885. In the latter case an indemnity was voted, but it was expressly stated at the time that it was a matter of grace, and not of right. In other words, any acknowledgment of 'the principle' has been expressly guarded against by Mr. Webster and by Mr. Evarts and by Mr. Bayard."

I assume that "the case of the attack on Spaniards in New Orleans in 1850" refers to the excitement in the United States in 1851 over the execution of a number of American citizens by the Spanish authorities for aiding an attempted insurrection in Cuba, which, at New Orleans and Key West, culminated in mob violence against Spanish subjects.

If I understand the history of that affair correctly, while there might not have been a distinct technical recognition of "the principle," yet our own Government did "recognize" the right sufficiently "distinctly" to pay every dollar of indemnity demanded by the Spanish Minister, amounting to $83,813.70, for Spanish subjects on account of damages caused by the riots at New Orleans and Key West. It also appears that Secretary Webster sent to the President the note of the Spanish Minister demanding the indemnity, with the suggestion "that Congress be recommended to make provision for the reparation desired." (Foreign Relations of the United States, 1886, pp. 152-3-4, title China.)

This matter was brought out fully by the Chinese Minister at Washington in his correspondence with Secretary Bayard over the Rock Springs massacre. When Cheng Tsao Ju had officially presented the facts of the Rock Springs horror to Secretary Bayard, he doubtless anticipated, from prior experience of his legation, some cheap and perfunctory expressions of condolence, with a denial of liability for indemnity; for he continued, p. 103:

"With this statement I might consider my duty discharged but for the fact that this legation, having had occasion to call the attention of two of your worthy predecessors to a similar but much less bloody and disastrous event, the honorable Secretary Evarts expressed some doubts as to the legal liabi ity of his Government to make pecuniary indemnity to the Chinese sufferers by the mob at Denver, in the State of Colorado, in 1880, and that the honorable Secretary Blaine concurred in the views of Mr. Secretary Evarts. I have, therefore, to beg the kind indulgence of your Excellency while I attempt to show why the present request for indemnification, in the opinion of my Government, ought in justice and equity to be granted, notwithstanding the views set forth in the notes of Secretary Evarts of December 30, 1880, and of Secretary Blaine of March 25, 1881. In doing this it is not my intention to either appeal to you from or to question the correctness of the interpretation of the laws of the United States as given by the distinguished jurist Mr. Evarts and confirmed by the experienced statesman Mr. Blaine. It would seem to me, however, to be just that, if the view taken by Mr. Evarts as to the obligation of the United States to make indemnity for injuries to private individuals from mob violence should be insisted upon and adhered to by your Excellency's Government, China should, in due reciprocity and international comity, accept and practise the same principle."

Then he proceeds to show, among other things, wholly from the records of our own Government, that China in one year paid as indemnity to American citizens $735,258.97.

I am aware that Secretaries Evarts and Blaine talked the Chinese Legation out of the indemnity claim for damages sustained by the Denver mob of 1880, and Secretary Bayard undertook to shelter himself under the same cover in his correspondence with the legation over the Rock Springs case. However, Cheng Tsao Ju was not so easily turned down as Chen Lan Pin. Yet, even in the Denver case, Mr. Blaine was so hardly pressed that he set up the fact, as a flimsy makeweight in his argument, that the Chinese were, at the time the mob commenced, also violating American law by being about a saloon on Sunday. Cheng Tsao Ju conducted his correspondence with a masterly ability and dignity. He not only refuted the doctrine of Evarts, Blaine, and Bayard, but demonstrated that China was right in this claim for indemnity, under our own precedents, and compelled our Government to do the only thing it in honor and consistency could do, which was to pay the indemnity in full, which it did.

While it is true, as the *Nation* says, that our Government, in so doing, said "it was a matter of grace and not of right," I submit that it was a matter of "reciprocity" and justice if not of strict technical right.

The judicial proceedings that followed the Rock Springs butchery—coroner's inquest, report of the Grand Jury, etc.—were such a grotesque travesty that no wonder Cheng Tsao Ju, in referring to the matter, said, with a sarcasm as keen as a Damascus blade, "The judicial proceedings which followed the sad event are described as 'a burlesque.' The conduct of the coroner who investigated the causes of death seems to me strange, *but with my imperfect knowledge of American procedure I prefer not to criticise it.*" (F. R., 1886, p. 102.)

It may also be interesting to note here, for the benefit of demagogues who bank upon the wickedness and depravity of the heathen Chinese, an incident that occurred in the distribution of this indemnity fund among the Rock Springs sufferers. When the money was paid over to the Chinese Minister at Washington, it was sent to their Consul in San Francisco for distribution. The list of claimants numbered 764, and their several demands ran from as low as $11 to over $3,000. It had gone through the red-tape office at Washington, and had been approved by the Commission, yet, on actual distribution, the Consul at San Francisco discovered that six names had been repeated in the list, making an aggregate over-payment of $480.75, which he promptly returned to the legation at Washington; and on the 24th of October, 1887, Chang Yen Hoon, the Chinese Minister at Washington, returned it to Secretary Bayard. (Papers relating to the F. R. of the U. S., 1888, pp. 243-4.)

J. T. Mayfett.

THE SICILIANS AT HOME.

To the Editor of The Nation:

Sir: The following information may be found interesting and appropriate at this time. Some few years ago, being in Sicily, we heard much praise of a certain Gen. P., commanding there, who was carrying on, more successfully than his predecessors, a campaign against the brigands. His system was this: When the troops made any prisoners, they were bound and guarded so carelessly that they, as a matter of course, tried to escape, when they were immediately shot. This system was recognized as the only means of securing deserved punish-

ment for their incredible crimes, as no jury ever agreed in convicting them, the Maffia holding every one in complete subjection.

It is difficult to discover any fundamental difference between this system adopted by a general in the Italian Army and that practised at New Orleans. If there be any people who doubt the ultimate righteousness of the two processes, I think a few portraits of these Sicilians would convert them to a warm desire to have as many disposed of, and as rapidly, as could conveniently be done. They are not human in the ordinary meaning of the phrase, but very dangerous wild beasts.

Sicily has lain under a black pall of oppression through all the centuries, and has been almost untouched by the movements of civilization. Even now the efforts of the Government are of little or no effect, being so nearly neutralized by the feudal rights of the great landowners, who are almost totally without compassion for the people. A Sicilian of to-day is virtually a survival from the middle ages, absolutely incapable of understanding civilization and its laws, duties, and advantages. Force and fraud are the sole paths he knows of to his ends, and revenge is his cherished bosom companion.

This no doubt seems exaggeration and prejudice to some who have not lived where these people can be studied, but I fear the United States will have many a chance now to learn the correctness of the statement, since we are doomed by fate and the absence of common sense from our emigration laws to have many thousand of such fellow-citizens. Perhaps in this view it may not be amiss for those who do not already know the positive barbarism of these people, to have one or two facts set before them showing the precautions Sicilians find necessary against their country-people's ways and means.

Having letters to one of the greatest ladies of the land, we were one day taken by her to see one of her score of country places about two miles from the city. The house was fine, in the midst of gardens and park of extreme beauty, and everything in perfect order, but the owner herself could not live in it for danger of being carried off to the mountains. She could only drive there every day to enjoy its beauty, taking care to leave before twilight. Her town house, in a closely built street, had a veranda behind, about fifteen feet above the large garden. It was furnished with luxury, had pictures and statues, and was shut in for the whole length by heavy iron gratings—like a prison—for defence against the brigands.

The landlord of our hotel showed a ring which he put on when he drove out to his farm near the city, from which he drew his supplies. This ring contained poison for himself if he should be carried off to the mountains. He objected to having his ears and nose and fingers sent down to his family by instalments in default of ransom, and did not wish them to be ruined by paying it.

In one of the larger towns a friend of ours strolled into a doorway, before which stood a guard of soldiers. He found one or two judges on their bench, a few lawyers, and a crowd of prisoners—men, women, young girls, children, priests. It was the whole population of a village which had been a scourge for years for all the country round. Every imaginable crime and cruelty was proved, for the Government brought its full power to bear, and happily they were convicted—sent to the galleys, from which they escape or are discharged and go to us. We may be sure, though the letter of their law of murder and theft may vary in different countries, the spirit will remain the same, and our habits of letting things drift into order if they can, will presently seem to us, as it does now to the rest of the world, criminal neglect of precaution against a very great evil and burden.

M. G. L.

Florence, April 5, 1891.

A FRATERNITY OF STUDENTS IN PARIS.

To the Editor of The Nation:

Sir: As a part of the great and hopeful movement which bids fair to give the world a more cosmopolitan intellectual life than it has ever had in the past, the recent banquet given under the auspices of the General Association of the students of Paris deserves attention. Not many months ago the University, recognizing the importance of the foreign element among the students, established a Committee of Reception whose business it should be to smooth the way for those coming from abroad. Of this committee the best-known members are perhaps MM. Taine, Pasteur, Lavisse, and Picot. Its secretary is M. Paul Melon. A further advance towards rendering the ties closer between the various universities of Europe and America was taken last week. Through the efforts of M. Bérenger, President of the General Association of the Students, and Mr. A. J. Herbertson, the most active member of the venerable Scotch College of Paris, a banquet was arranged at which the foreign students and the Committee of Reception might make each other's acquaintance. Mr. Leo S. Rowe of Philadelphia spoke for the Americans present.

The most important provisions of the project of organization to be submitted to the various universities are as follows: (1.) Each university shall organize a committee of reception for foreign students, such as already exists at Paris and Montpellier and in Sweden and Scotland, and in which the general body of the students shall be represented by a delegate. (2.) In each association of students (such as that at Paris) the foreigners shall group themselves according to "nations," in order to establish regulations between the foreign students themselves and between them and the General Association, as well as to diminish for those newly arriving the moral and material difficulties incident to establishing one's self in a strange land. (3.) These "nations" shall each choose a representative to serve as intermediary between themselves on the one hand and the Committee of the Students' Association and the Committee of Reception on the other.

Although the comparatively rare appearance of a foreign student at our universities would seem to render an organization of this character premature, there is reason to look forward to a time when our educational institutions will exercise an attraction upon the students of Europe in some degree equivalent to that which brings hundreds of our graduates across the ocean every year. It is at least clear that the steps taken at Paris, if followed by other important universities, cannot fail to make the intercourse among the students of different nations easier, and so do away in the rising generation with the narrow prejudices which have so long been falsely regarded as an element of patriotism.

James Harvey Robinson.

Paris, March 27, 1891.

JOHN WHITE'S DRAWINGS.

To the Editor of The Nation:

Sir: In 1880 it was my good fortune to come across, in the Grenville Collection, British Museum, the original drawings from which De Bry's engravings of Virginia (or rather of North Carolina) Indians as seen by Raleigh's colonists were made. Part of these I had photographed and reproduced in the *Century Magazine* for November, 1882, and May, 1883. John White's very remarkable map of the coast was first brought to the attention of scholars by its publication in the number of the magazine for November, 1882. It is in the same volume with the other drawings—a volume sold to the Museum by Henry Stevens after it had been offered to our own Government.

I was not aware, when I made my publication of these drawings, that Mr. Edward Everett Hale had discussed many years before another volume in the British Museum purporting to contain John White's originals from which De Bry's engravings were made (*Arch. Americana*, iv., 21). This volume is in the British Museum, in the collection known as Sloane and Additional Manuscripts. I concluded, on reading Mr. Hale's paper, that the two volumes contained the two parts of a complete collection of White's drawings. I believe they were so treated by Mr. Winsor, who cites Henry Stevens's description of the one and Mr. Hale's of the other. Yesterday, by the kind assistance of Mr. Richard Garnett and other officers of the Museum, I was enabled to compare for an hour or so the two collections, with a very unexpected result.

I find that the Sloane volume has, as Mr. Hale states, an inscription describing its contents as "the originalls" from which De Bry made his pictures, and as made by John White, "who accompanied" Sir Walter Raleigh on his voyage, etc. This inscription is written in a handwriting unmistakably of the seventeenth century. But as Raleigh did not make the voyage in person, the inscription must have been made by some one ignorant of the facts, and it is therefore without authority. I am inclined to think that the writer of the memorandum meant to say that these were copies of the originals of De Bry's drawings. There is another memorandum in the book, unimportant except that it is dated 1673, which shows that the pictures were made not more than eighty-eight years later than White's originals.

I did not compare closely the botanical and zoölogical drawings, but many of them coincide in subject in the two volumes, and *all* the figures of American Indians in the Sloane book are in the Grenville with many more, for the Sloane has but eight American-Indian pieces, including the two Esquimaux and the view of Pomeioc. The Grenville drawings are immensely superior in technical quality to those in the Sloane, and I thought at first that the Sloane lot might be the original sketches, and the Grenville the completed pictures. But this hypothesis proved untenable. The Grenville figures are Indians. No one acquainted with Indian characteristics will doubt for a moment that the artist had known the real savage. The figures in the Sloane collection have lost all race character, and could not possibly have been made by any man who had ever seen Indians.

Two things are evident:

(1.) That the pictures in the Grenville are the originals used by De Bry. The correspondence of the inscriptions, both in handwriting and phrasing, proves this.

(2.) They are by the same hand as the map of the coast, in the same volume, and that hand is presumably White's. The correspondence between the handwriting and the execu-

tion of the map and the figures shows that they are by the same clever artist.

Both collections have drawings of costume other than Indian, but these non-Indian drawings are not identical in subject throughout. Among those found in both are the Ancient Britons, reproduced by De Bry. Lastly there is nothing in De Bry that he could have found in the Sloane book and not in the Grenville, while there are many of De Bry's subjects in the latter which are not in the former. I am forced to conclude that the drawings in the Grenville are John White's originals, which were used with some changes by De Bry, and that the Sloane pictures are not originals, but early and rather clumsy copies. Only a more critical examination than I had time to make will show whether they were copied from White, from which they vary considerably, or from De Bry's printed pictures.

EDWARD EGGLESTON.

LONDON, April 9, 1891.

CARDINAL NEWMAN.

TO THE EDITOR OF THE NATION:

SIR: I think the thoughtful public owes a debt of gratitude to "F. H." for his plain-spoken words about Cardinal Newman—and this in spite of the vein of capticusness running through the whole communication. The letter did scant justice to Newman's better and nobler traits, yet I think it is the truest thing that has yet been written about him. It showed pretty clearly the real character of Newman's mind and thought, and in showing it revealed its narrowness and worthlessness. His moral character was very far from worthless—that goes without saying: grave, pure, lofty, and austere, it was a power for good wherever its influence was felt. But his intellectual influence was pernicious just so far as it was felt.

It is true, Mr. Hutton, in his recent essay upon Newman, speaks of his great powers of mind and of his great mind. Now, great powers of mind he certainly had, for he possessed wide scholarship, first-rate dialectical skill, considerable intellectual penetration and subtlety, and extraordinary command of language. But I claim that such powers as these do not make a great mind. It is the use of them that determines that, and the use that Newman made of them was an exceedingly poor one. Following the ascetic and mystical bent of his nature, he found his light and inspiration in the grim theology of the early Christian Fathers, and set his back upon all the broadest thought of the age. He was familiar with history, but he used it to support the narrowest dogmas. He was acquainted with the trend of modern thought, but he believed it corrupted men's minds. Luther, one of the greatest figures in history, was to him a creator of heresy and schism. The 'Apologia' is a great piece of dialectical writing, but the intellectual pettiness it reveals is to many minds simply pitiful. I am convinced that Kingsley could have written a crushing answer to it if he had chosen.

Probably Newman's style will secure for his works, at least for some of them, a permanent place in English literature; but I think it is safe to say that his influence as a thinker will be small. He will help to confirm some in those narrow ways of thought in which his own mind moved. He will give spiritual refreshment to many who turn to the finer and more beautiful things that are scattered through his writings. His ideals of Christian virtue will always be found helpful and ennobling. His thought will contribute not one jot or one tittle to the world's intellectual progress.

And may I trespass on your space to say just one thing more? Does not Mr. Hutton's pseudo-liberalism attest the pernicious character of Newman's influence? A tree is known by its fruits, and the Christianity that sees no moral obliquity in a union of Church and State, and in the Tory methods of governing Ireland, does not impress me as a thoroughly admirable thing. I am a most uncompromising believer in what is loosely termed Evangelical Christianity, but I prefer the non-religious morality of the *Nation* to the non-moral religion of the *Spectator*, which cannot tell bigotry and brutality when it sees them at its very door.

EDMUND H. SEARS.

BOSTON, April 12, 1891.

LANDOR'S BAD ENGLISH.

TO THE EDITOR OF THE NATION:

SIR: In corroboration of the statement made by your indefatigable correspondent, "F. H.," that the use of our language, "even by eminent Britons," is fairly open to criticism, I submit the following:

"The family of Sir Thomas [Lucy] became extinct nearly half a century ago, and the estates descended to the Rev. Mr. John Hammond, a respectable Welsh curate, between whom and him there existed at his birth eighteen prior claimants."

This remarkable specimen of English is by no less eminent a Briton than Walter Savage Landor (Works, ii., 457).

I am, sir, etc.,

WM. HAND BROWNE.

THE RANGE OF RATIO OF THE PRECIOUS METALS.

TO THE EDITOR OF THE NATION:

SIR: There has been printed for private circulation by Mr. John Henry Norman of London a paper which he read before the Royal Statistical Society, which ought to be in the hands of some of our frantic statesmen, *i. e.*, those who propose to remove all evil by making fiat-money, either of paper or of the inferior of the two most precious metals of monetary use. Mr. Norman shows that, from the Conquest to this day, whether under a double or a single standard, the price of wheat has varied from other influences than those of the coinage. He shows also that the per-capita theory is the vainest of delusions, "as every wise man's son doth know"; that the proportion of gold to silver has varied from 1 to 12.54 in the time of Edward III. to 1 to 5 in the time of Edward VI., and back to 1 to 14 28 in the time of George III. This shows a much greater range than Prof. Laughlin gives, as I remember his tables and charts, in his 'History of Bimetallism.' The variation in the gold price and silver price for wheat is great, notwithstanding there was free (*i. e.*, unlimited) coinage of silver. The number of grains of gold, and the number of grains of silver, relatively to a quarter of wheat, varies 3 or 4 per cent. in the number of grains required of gold to silver.

The lesson for the fiat people to be found in Mr. Norman's table is in the shrinkage in the weight of the pound sterling from 5,328 grains of fine (pure) gold in 1066 to 113 in our day, and of the shilling from 266 grains of silver to 80 grains in George the Third's time. It is, as Locke said, not the sound or name of the coin, but the fine metal it contains, which gives its purchasing power. The pound of to-day and of the Conqueror's time vary exactly as their grains of gold (laying aside archaic reasons).

The little book of a dozen pages is full of meat for the student, and it is to be hoped that Mr. Norman will issue it for sale.

POSEY S. WILSON.

DENVER, COL., April 12, 1891.

Notes.

DODD, MEAD & Co. are preparing to issue in the autumn the fifth and concluding volume of Mr. James Schouler's 'History of the United States.' It covers the period from 1847 to 1861, or from the Mexican to the Civil War.

J. B. Lippincott Co. are about to publish 'The Old Navy and the New,' by Admiral Ammen; and 'Man Immortal,' an allegorical poem by William Stitt Taylor.

Mrs. Caroline E. Upham, with the aid of Mr. Wm. P. Upham, has made a popular abridgment of C. W. Upham's 'History of Salem Witchcraft,' now a costly book, compressing the narrative into a hundred pages. The Salem Press Publishing and Printing Co. will bring it out in two editions, one, limited, on large paper.

Welch, Fracker Co. announce 'Ohio in Art,' by Francis C. Sessions, a subscription work, freely illustrated. The list of artists embraces Thomas Cole, Hiram Powers, J. Q. A. Ward, Kenyon Cox, the Beards, Robert Blum, J. H. Twachtman, etc.

The Historical Printing Club, No. 97 Clark Street, Brooklyn, N. Y., offers in a limited edition 'The Press of North Carolina in the Eighteenth Century,' with a bibliography, by Stephen B. Weeks.

Mr. Thomas A. Janvier's 'Stories of New Spain' is to be published immediately by D. Appleton & Co. One of the collection, "A Mexican Night," has not appeared before.

'Balaam and his Master, and Other Stories, by Joel Chandler Harris, and 'Fourteen to One,' short stories by Miss Phelps, are on the summer list of Houghton, Mifflin & Co.

D. C. Heath & Co., Boston, have in press 'American Literature,' for high schools and colleges, by Julian Hawthorne and Leonard Lemmon; and 'French by Reading,' a new inductive method, by Louise S. and Mary Houghton.

John Wiley & Sons are preparing 'The Mechanical Engineer's Pocket-Book,' by William Kent, C.E.

The Memorial Volume of 'Essays and Monographs,' by the late Prof. William Francis Allen of the University of Wisconsin, has been issued in a worthy shape by the committee in charge of the editing, with a fairly good likeness of this pure-minded and genial scholar. A sufficient biographical sketch is prefixed, and a very full bibliography appended, from which Prof. Allen's enormous block of contributions to the *Nation* is obvious at a glance. Of the Monographs, two are upon Roman topics; the rest constitute a valuable group of studies of primitive and mediæval communities among the Germans, French, and Anglo-Saxons; with a trace of the survival of land community in New England. Of the Essays, again, two relate to Rome; others are historical, educational, and religious. The volume, finally, of nearly 400 pages, has a good index. It may be had of Mr. David B. Frankenburger, Madison, Wis.

'Pepero, the Boy-Artist' (Houghton, Mifflin & Co.), more fully described on the title-page as "A Brief Memoir of James Jackson Jarves, jr., by his Father," gives an account of the short life of one who was believed by his family and friends to be destined to become the fu

ture great artist of America. It is illustrated with some thirty of his drawings—copies and original compositions. What he would have accomplished had he lived—he died in his fifteenth year—it is, of course, impossible to say; but these examples are certainly very remarkable work for a child, and the text gives a glimpse of a character as remarkable as the work and very beautiful. Born in Florence and dying in Rome, it is not unnatural that he should have been profoundly influenced by Michael Angelo, but he seems to have been almost as much affected by William Blake. The result is strangely pompous and academic for the work of a child, and shows little freshness or naïveté of vision. It may be doubted whether the influence of such powerful temperaments is the best to which a beginner in the arts could be submitted, but doubtless that study from nature which his ill health rendered impossible would in time have corrected what was unhealthy in the exclusiveness of his admiration.

'Student's Atlas of Artistic Anatomy,' by Prof. C. Roth, comes to us from B. Westermann & Co. It is likely to be as useful to students of art as such books ever are. The plates are excellently done, and the addition of the larger drawings of parts of the body greatly increases the value of the atlas. It is a singular oversight that there are no illustrations of the actions of pronation and supination of the arm. The notes are written in an extraordinary and, to us, quite unintelligible style.

'Paris of To-day' (Cassell Publishing Co.) is a bright and readable bit of journalistic work, and has been translated out of the original Danish of Richard Kauffmann into excellent English by Miss Olga Flinch. It manages to convey a great deal of the peculiar charm of Paris, together with considerable miscellaneous and not very important information. It is profusely illustrated with clever sketches by French artists, of which those in "tone," however, suffer by indifferent reproduction.

The collection of "Les Grands Écrivains Français" grows slowly but steadily, and the latest volume to appear is M. Arvède Barine's biography of Bernardin de Saint-Pierre (Paris: Hachette; New York: F. W. Christern). It is a careful sketch—a little cold-blooded, but appreciative in the best sense, since it is founded on a thorough study and an exact understanding of Saint-Pierre's contradictory character. Perhaps the most interesting passage is that in which the author of 'Paul and Virginia' is shown to have been one of the very earliest of Frenchmen to appreciate the beauties of landscape, of sea and of sky, of nature out-doors and under the changing conditions of the seasons. Another passage likely to surprise some is that in which the critic quotes Sainte-Beuve and Gautier to show that 'Paul and Virginia' is no colorless pastoral, but an amorous idyl worthy of comparison with 'Daphnis and Chloe.'

The second volume of the second series of the oddly named 'Journal des Goncourt'—since this second series is the journal of one Goncourt only—covers the years 1872-1877, and is preceded by a preface in which the surviving M. de Goncourt tries to break the force of M. Renan's indignant disclaimer of words put in his mouth in the first volume of this series. M. Renan declared that M. de Goncourt was incapable of apprehending a general idea. The latter's preface and these pages from his diary are unwittingly strong evidence in support of M. Renan's opinion. But this is the most interesting volume of the journal, for it abounds with quotations from the talk of Flaubert, Turgeneff, and Zola. From these pages we get strange side-lights on the little knot of men who met at Flaubert's on Sunday afternoons. These curious revelations repay the reader for the wearing conceit of the diarist—a conceit colossal almost beyond parallel in literature, and as sickly as it is swollen.

We have already noticed Señora Bazán's latest novel, of which the first part is now done into English under the title of 'A Christian Woman' (Cassell Publishing Co.). The translation, by Mary Springer, is painstaking and sufficiently accurate, though it often fails to convey the sprightly vivacity of the original. A portrait of the author, of rather dubious artistic value, forms the frontispiece of the volume, which is attractively and, on the whole, accurately printed.

The latest Bulletin of the Boston Public Library contains a list of recent works on American domestic architecture; a list of Spanish and Portuguese books given circulation by the Library; and a noticeable finding-list of works by and relating to J. J. Rousseau.

One generally distrusts a publication which offers a premium to subscribers, as if it did not of itself return an equivalent for the subscription price. Such distrust may be dismissed in the case of that excellent periodical, the *American Bookmaker* (New York: Howard Lockwood & Co.), which freely endows its subscribers with an important work, 'The American Dictionary of Printing and Bookmaking,' calculated to extend to 600 quarto pages, profusely illustrated, and to take three years in the finishing, during which time the parts will not be for sale. Part I. (A—Blanks) has appeared this month, and gives promise of filling worthily a vacant niche in our technical books of reference. Noticeable is the inclusion in one alphabet of French, German, and Italian terms of the art along with English. The international biography of printers, engravers, type-founders, publishers, binders, etc., is naturally fullest in the American portion. The portraits and the illustrations in general can be praised without reserve, and the proof-reading has been carefully looked after.

Dr. Daniel Sanders's *Zeitschrift für deutsche Sprache* will be hereafter published at Paderborn by Ferdinand Schöningh. It is now entering on its fifth volume.

We have received three more parts of the new Flügel's 'English-German and German-English Dictionary' (New York: Westermann), viz., two in continuation of the former section, which is carried as far as the word Horse; and the first of the German-English section (A—Capital). It is needless to discuss the rank of this great dictionary, but we must postpone a critical examination of it till it is somewhat nearer completion.

From the publishing-house of Delagrave in Paris we have received the first four parts (A—Brouette, pp. 1-304) of the epoch-making 'Dictionnaire de la Langue Française' to which the late lamented Arsène Darmesteter put his hand with so much learning and industry for nearly half his short life of forty-two years. His colleague, Prof. Adolphe Hatzfeld, has associated with himself a pupil of Darmesteter's, M. Antoine Thomas, and the three names are associated upon the title-page. There will be thirty parts. To this work, too, we must return later.

In a brief notice of the new edition of Mr. Herbert Spencer's "Essays" the *Academy* of Apr. 4 says: "The truth is that Mr. Spencer, like De Quincey, has been more honored during his lifetime in the United States than in his own country. It was otherwise with Darwin, not one of whose works, we believe, have [*sic*] ever been reprinted in America down to this date." This is the most amazing piece of literary news that we remember since Funk & Wagnalls's famous statement of last autumn that they had sent Prof. W. C. Wilkinson to Europe "to consult, in the interest of our Dictionary, the celebrated French lexicographer, M. Littré, the author of what is unquestionably the most admirable dictionary of any language," and mentioned the fact as "another indication of the thoroughness with which the work upon this Dictionary is being pushed."

The American Society for the Extension of University Teaching, whose headquarters are at No. 1602 Chestnut Street, Philadelphia, purposes publishing a journal, called *University Extension*, to serve as a medium of communication with the local centres or branches.

The Committee on English Research of the New England Historic Genealogical Society appeals for funds to continue Mr. Henry F. Waters in the work which he has so brilliantly illustrated in the case of Washington, Harvard, and Roger Williams, while following out in no narrow spirit American clues such as no other person possesses. The Society also desires to accelerate the rate of publication of his "Gleanings" in the *Register*, and to that end needs a contribution of $2,000 annually for at least five years. A quarter of this sum has been already subscribed. The Society's address is No. 18 Somerset Street, Boston.

Mrs. Augustus Craven died at Paris, on April 2, at the age of eighty-two years. She was a daughter of M. de La Ferronays, sometime Minister of Foreign Affairs and Ambassador to St. Petersburg under the Restoration. Many Americans will recall the intimate acquaintance that they gained with Mrs. Craven's family some twenty years ago through her book, 'A Sister's Story,' which, in spite of its sentimental Roman Catholic pietism, may still be called a good book. Besides this 'Récit d'une Sœur,' Mrs. Craven wrote 'Souvenirs de Famille,' 'Fleurange,' 'Le Mot d'Énigme,' and other volumes. Her papers and unpublished writings are bequeathed to her nephew, Count Albert de Mun, the well-known Catholic-Socialist Deputy.

Ten years have elapsed since the American School of Classical Studies was organized at Athens, and it is gratifying to learn from the ninth annual report of the Managing Committee that, while the desired endowment has not been wholly raised, the contributory colleges are mostly ready to renew their stated support. The School can point to its pupils as now occupying important positions, principally as teachers, in eighteen States of the Union, from Maine to Texas and South Dakota. Together with this report, the Archæological Institute of America sends out an Index to its publications during the decade, by William Stetson Merrill of the Newberry Library, Chicago. It is a very thorough piece of work, filling, with a Greek index, eighty-nine pages.

Mr. F. Gutekunst of Philadelphia sends us a large photograph of the late Lawrence Barrett, one of the best of the many fine portraits of contemporaries which have left his photographic gallery of recent years. The portrait shows the strong face of the actor, with its fiery eyes, its determined mouth, and the grizzled hair over the forehead. A study of this photograph will go far towards explaining the reason why the lean and hungry *Cassius* of "Julius Cæsar" was always Lawrence Barrett's highest achievement on the stage. Physical gifts and personal limitations count for

more in the theatre than in any other walk in life. Mr. Gutekunst has not been less fortunate in his "imperial panel" of the late P. T. Barnum, a vigorous presentation of a remarkably youthful personage.

—"S. A. B." inquires:

"Can any one explain the law or custom regulating the seals formerly in use in the United States Custom-house? In Boston Thomas Melville was Naval Officer from 1811 to 1829. In 1819 he appointed Samuel Parker to be his deputy, and the commission bears the following seal: The inscription around the margin reads, 'Custom House of the District of Boston and Charlestown.' The centre bears the American eagle, grasping the arrows or thunderbolts, and he holds in his beak a shield whereon are displayed the arms of the Commonwealth of Massachusetts. I desire to know for what period this seal was used, what preceded and succeeded it, and also whether a similar device was used in other customs districts, presuming that the State arms varied in each."

—"C. C." writes to us as follows:

"Can you put me on the track of the author, or the origin, of the phrase, *esprit d'escalier*? Is it a French phrase, or, is it, like *nom de plume*, an English manufacture, and not French at all? It has long been familiar to me, and without examination I had believed it classical, or at least accepted. It is not, however, in Littré, under either word, and the other day, when it was used by an acquaintance of mine, he was asked what it meant; and as it turned out, he and I were the only ones present who had ever heard it. Moreover, an accomplished Frenchman to whom I have put the question, asks me what it means, and says he has never heard it used nor seen it in print."

In Meyer's 'Konversations-Lexicon' (4th ed.), under *Esprit*, we read: "*Esprit d'escalier* (Treppenwitz) is in Germany jocosely applied to the man who on the stairs, *i. e.*, on taking leave, thinks of something he ought to have said in the room."

—One of the most interesting and important public documents issued recently by any State is the first report of the Free Public Library Commission of Massachusetts, a volume of nearly 300 pages. It embraces the text of all the State's legislation concerning libraries from 1798 to 1890, when the act was passed by which this Commission was called into being; a classified list of the towns and cities provided with free public libraries in a special sense (viz., such as are wholly supported and controlled by the authorities), the towns where the support and control are partly a town concern, those in which it is not a town concern, and those which have no public libraries at all; and an extensive history of the rise and present state of such libraries as exist, in alphabetic order, together with numerous views of the library buildings. No more cheering reading can be found. Exactly one-half of the 351 towns and cities enumerated have libraries entirely under municipal control, and two-thirds are provided with public libraries. The 103 towns destitute of any comprise a population of but 134,719, or an average of about 1,300 souls; and sixty-seven of these have declined in population in the past five years. In many of these it may be doubted whether the public library would have any greater staying power than the churches which are deserted by the inhabitants. Nevertheless, the State will make the effort to put down the stake if the townsfolk will assist. Some of the public libraries have grown out of social libraries originating in the last century, like that at Boylston, which had maintained an unbroken and active existence for eighty-eight years. At Franklin, some ninety volumes are yet preserved out of a gift establishing a library by the town's namesake, then Minister to France, in 1785. In one case, Ludlow, the free library is wholly supported by the local manufacturing company, the building having been erected as a widow's memorial to her husband, and presented to the town, and the books having been at first intended for the company's employees. The founders or promoters have frequently been women, as well as clergymen and professional men. Natives who have gone out from the little towns to seek their fortune have remembered their birthplaces with these best of monuments. Sometimes the dead soldiers of the civil war have furnished a motive. In two or three instances special efforts are made by the libraries to secure an exhaustive collection of publications relating to the locality. The photographic views of library buildings are numerous and most interesting. Among the newer structures are some of the finest examples of architecture in the State. Subsequent reports are not likely to be so full as this, since the historical sketches have been written once for all; but perhaps more views will be provided. We could wish, also, for a map of the State showing all the towns, and coloring or otherwise distinguishing them as having or not having libraries. Another map might be shaded to show the number of volumes accessible in every part of the State. Such graphic illustrations would do much to promote emulation.

—We regret to record the death of Dr. James K. Thacher, Professor of Physiology in the Yale Medical School, who died suddenly of pneumonia on Monday last, at the age of forty-three years. He was a man of remarkable power, but his professional duties so far interfered with continuous scientific work that the results of his labors are to be found in short monographs, chiefly known to specialists. He won an international reputation by his studies on "Median and Paired Fins" in the Transactions of the Connecticut Academy for 1877, in which he opposed Gegenbaur's views, and developed the theory, since elaborated by Mivart, of the evolution of the limbs of the higher vertebrates from the fins of archaic fishes. Of late he has principally devoted himself to the study of heart-action and pulse-waves. His most important paper on the latter subject appeared in 1888 in the Transactions of the Association of American Physicians, of which he was one of the original members.

—To Mr. Stewart Culin, who has made himself familiar with the inner life of the Chinese among us, we are indebted for a clear and interesting account of 'The Gambling Games of the Chinese in America.' The pamphlet, neatly bound in boards, is issued as the fourth number in the first volume of a series in philology, literature, and archæology, published by the University of Pennsylvania, in Philadelphia. The two most popular games of risk are Fan T'an, "the game of repeatedly spreading out," and Pak Kop Piu, or "the game of white-pigeon ticket." The first is a very simple procedure, in which a handful or two of Chinese coins are covered with a brass cup, whence they are repeatedly spread out on the table with a tapering rod by "the ruler of the spreading out." The players deposit their wagers on or beside the numbers they select on the plate, which is a sheet of tin in the centre of the table, with its edges marked off from right to left, with the numbers from one to four. The master of the game sits at one end of the table, and the clerk or cashier at the other. In extemporized games, a mat will suffice, the plate with numbers being simply a square marked in ink. With slight variations, the game consists in the players guessing what remainder will be left when the pile is divided by four, the bets being upon the result. The fan t'an companies, of which there are eight in Philadelphia and over thirty in New York, have in each case a capital of fifty or a hundred dollars. Each of the smaller companies makes a profit of about five dollars a day; the tables in the gambling cellars being often used by several companies alternately during the twenty-four hours. Various changes in furniture and method are made from time to time, to turn a run of bad luck, or to make conviction difficult when the place is raided by the police. Somewhat more respectable is the other game of lottery, which is played in upper rooms and appears to be a simple game of chance. The cards used are made in China, and stamped or printed with the first eighty characters of the Thousand-Character Classic, which are so well known by all Chinese from boyhood as to serve for numerals. In China, where lotteries are illegal, they are frequently carried on among the hills near the cities, and it is said that pigeons are used to convey the tickets and winning numbers between the offices and their patrons—whence the name applied first to the tickets, and from them to the lottery itself. The upper room, instead of the cellar, is a survival of the loft used in China, but neither this nor other precautions here used seem to be necessary, for the United States mails serve as carrier pigeons, and the runners daily traverse the cities from laundry to laundry, soliciting custom. The pamphlet of seventeen pages is packed with suggestive information about the guilds, habits, and superstitions of the wonderfully well-organized people among us who have come from the freest country and greatest democracy in Asia. How their gambling habits and their religion are well mixed together, and how the proprietors of the gambling-dens are among the most orthodox, and often of the straightest sect of the Celestial pharisees, in keeping alive the traditions and religious ceremonial of their native country, is clearly shown by Mr. Culin. In a word, here among us are seen survivals of methods by which some of our oldest colleges and philanthropic institutions were endowed, but which are now in vogue chiefly in Louisiana.

—It is well known that the German historian Leopold von Ranke intended to write his autobiography, but was diverted from this purpose by what he deemed the more pressing claims of his 'Weltgeschichte' and a new edition of his "Sämmtliche Werke." After his death the latter task was completed by Dr. Alfred Dove of the University of Bonn, who published, as the twelfth and concluding volume of the work, a mass of interesting contributions to the venerable historian's life, entitled 'Zur eigenen Lebensgeschichte' (Leipzig, 1890). This volume, as the title indicates, is made up of autobiographical material, consisting of diaries, fragmentary memorabilia, relations of important events (such as Ranke's interview with M. Thiers at Vienna in 1870), but chiefly of letters to members of his family and his most intimate friends. Ranke's younger brother Heinrich, a distinguished theologian and pulpit orator, settled at Rückersdorf, near Nuremberg, in Bavaria, was afterwards appointed professor in the theological faculty at Erlangen, and finally made consistorial councillor at Munich, where he died in 1876, and where his two sons, the physician Heinrich and the anthropologist Johannes, are now professors in the University.

It was to this branch of the family that the greater number of the three hundred and twenty-nine letters, nearly all of which are here printed for the first time, were addressed. Of the remainder, the most noteworthy are those written to his wife, to his youngest brother Ernst, professor of theology at Marburg, to the philosopher Heinrich Ritter of Göttingen, and to his pupils Giesebrecht, Sybel, Waitz, and Maximilian II. of Bavaria, who as Crown Prince studied in Berlin in 1830, and whose warm friendship Ranke enjoyed from that time until the sudden and untimely death of the King in 1864. Ranke states that King Maximilian had often spoken of the policy which Bavaria ought to pursue in case of an armed conflict between Austria and Prussia, and is firmly convinced that, if this monarch had been living in 1866, he would have taken no part in the war, and certainly not as Austria's ally. His aversion to Beust was intense, and he was too broad-minded and level-headed to be carried away by local patriotism.

MADISON'S SECOND ADMINISTRATION.—II.

History of the United States of America during the Second Administration of James Madison. By Henry Adams. 3 vols. Charles Scribner's Sons. 1891.

THERE was, it must be admitted, a plentiful lack of executive energy in the political, military, and financial administration of Madison during this period of storm and stress. Yet there was no lack of constancy. The "pertinacity" of Madison now stood him in good stead. After a whole chapter devoted to a description of the "exhaustion" which overtook the Government in the latter part of the year 1814, Mr. Adams devotes another chapter to the exposure of the ineptitude betrayed by Congress in dealing with the currency, the restoration of which to something like a solid basis was seen to be the first condition of financial reform. The plan of finance adopted by Gallatin at the outset of the war had assumed that all deficits were to be covered by loans, but the Government had now reached a stage, at the beginning of the fiscal year in July, 1814, when further loans were found impracticable. Dallas did not conceal from his political friends the sharp points of the trilemma on which the public credit was impaled. Yet, to the honor of Madison, of the Treasury Department, and of Congress, be it said that even at a time when "the Treasury was suffering under every kind of embarrassment," the Republicans of that day set their faces like a flint against the cheap and easy expedient of legal-tender paper money. Jefferson, it is true, had argued that inasmuch as the State banks had virtually declared their *déchéance* by suspending specie payments, it was now competent for Congress to issue promissory notes "founded on specific taxes" to give them currency. Mr. Adams thinks that though Jefferson "did not touch on legal tender," his assumption of power implied in the issue of paper "seemed to require that the Government should exercise its right of obliging its creditors to accept it." We do not know on what authority this statement is made, as the implication was expressly negatived by the language of Jefferson in his correspondence at this epoch. He confined himself entirely to a method of finance which, "based on specific redeeming taxes," would, as he said, enable the nation to anticipate, in its yearly paper emissions, the resources of the next year and of the future peace. He openly denounced a resort to "juggling tricks" or "banking dreams," and held up for warning the example of the nations that had tried "every path of force or folly" in the "fruitless quest to make money out of nothing."

Dallas, in a letter to Eppes, the Chairman of the Committee on Ways and Means, written under date of October 19, 1814, rejected even the temporary expedient of Treasury notes emitted on the basis of future taxes, and excluded the alternative of a possible resort to "juggling tricks" by significantly adding that "the extremity of that day cannot be anticipated when any honest and enlightened statesman will again [that is, after the experience of our Revolutionary war] venture upon the desperate expedient of a tender law."

Mr. Adams dismisses this episode in our financial history without a word of comment beyond the remark that, "without a tender law, the Virginia scheme would have hardly answered the purposes required." But seeing that a tender law was avowedly excluded from the thought of Jefferson, and was indignantly scouted by Dallas, we could rather have wished that the opportunity might have been utilized for pointing a moral in favor at least of the perspicacity and probity with which the financiers of that time, though weltering in fiscal mire and bog, refused to clutch at the makeshift of legal tender. Ten years later, when a Georgia politician of the strict-construction school would fain portray the last enormity of the Federal usurpations that might one day be risked in the name of the "implied powers of the Constitution," he predicted that, under the pressure of war, the Government might possibly assume the power to pass even a legal-tender act. The prediction was fulfilled in 1862, under the stress of our civil war. The moral sophistication wrought by that untoward act in defence of a good cause soon spread to the intellect of the country, and so darkened counsel that in 1883 the supreme judicial sensorium of the nation was brought to believe that Congress has the constitutional power to make Treasury notes a legal tender in payment of private debts, in time of peace as well as in time of war. There was certainly much of irresolution in the civil and military conduct of our second war with England, but there must have been some saving grace in the men who preferred to stand by the moral order of the world, in spite of the strong temptation to break it. When, in November, 1814, Bolling Hall of Georgia introduced into the House of Representatives a resolution authorizing the issue of Treasury notes with the quality of legal tender attached, the House refused even to consider the proposition, by a vote of more than two to one.

Doubtless it is easy for Mr. Adams to show that the Government, in the estimation of many Federalists, was standing at the brink of dissolution in the closing months of the war. He reminds us that Timothy Pickering confidently expected a division of the Union; that less extreme Federalists looked to a dissolution of the Government from pure inanition; and that only a year after the war, Joseph Hopkinson, "a distinguished Federalist of Philadelphia," publicly expressed the opinion that, when the war ended, the Federal Government "was at the last gasp of existence," and that if the war had lasted six months longer, the Union would have been dissolved into its original elements. Mr. Adams quotes, it is true, the contrary opinion of Mr. Calhoun, but he thinks that Calhoun failed to understand the real temper of the New England States.

It seems to us that Mr. Adams, while not exaggerating at all the difficulties of the crisis, has not sufficiently allowed for the pressure in the year 1814 of the same considerations which in the year 1813 defeated, as he says, all the expectations and prognostications of the Federalists. In 1813, he argues, there was a popular movement of concentration "which acted in direct resistance to the movement of events." "Under circumstances following each other in necessity so stringent, no Federalist," he adds, "could doubt that society would pursue the predicted course—but it did not. Illogical and perverse, society persisted in extending itself on lines which ran into chaos"—only the chaos did not come. When the news of peace reached the United States in February, 1815, "no one stopped to ask," says Mr. Adams, "why a Government which was discredited and falling to pieces at one moment should appear as a successful and even a glorious national representative a moment afterwards." Perhaps no one stopped to ask this question, because the "collapse" of the Government failed at the time to assume the questionable shape in which it now appears under the scorching analysis of Mr. Adams. There is a certain easy-going optimism in the American people which often keeps them in heart and hope under the gravest trials, and which too often makes them over-tolerant of deplorable evils in their political methods and of deplorable breakdowns in their civil administrations. Perhaps it is indigenous in a democracy. Certainly the Athenians had it in a high degree, if we may judge from the self-complacent panegyrics which Thucydides puts in the mouth of Pericles. Whether we call it optimism, or whether we call it insensibility to peril, certain it is that the Administration of Madison never ceased to balance its hopes against its fears at every stage of the struggle, whatever might seem the fate of war, even when Ross and Cockburn thought it proper, as Mr. Adams expresses it, to burn the national Capitol "as they would have burned a negro kraal or a den of pirates." The one single merit conceded by the historian to Madison as an administrative officer is that he would cling to a favorite measure, like the embargo, for instance, with "a degree of obstinacy that resembled desperation." And Mr. Adams might have found the same optimistic persistency in the views of Jefferson, even at the darkest hour of the "crisis." In the closing months of the war, when the philosopher of Monticello was looking forward with dread to "another year of sufferance for men and money," and when he felt that the best hope of the nation was peace, he steadfastly refused to despair of the Republic. He admitted that the apprehended defection of Massachusetts was "a disagreeable circumstance," but argued that if it took place, she would probably remain neutral, and so leave the United States more "sufficient for one enemy without her"; while if she should join the enemy, and if the Federalists should call in the English army, it would only be a transfer of the scene of war, and would make it easy to get ten men to march against her for one who was willing to march against Canada.

In the closing chapter of his ninth volume Mr. Adams indulges in some philosophical reflections on American character which bear directly on the question in hand. After showing that antipathy to war ranked first among the traits of American character at the beginning of the present century, he adds:

"No European nation could have conducted a war as the people of America conducted the war of 1813. The possibility of doing so explained the national trait and assured its con-

tinuance. . . . A people whose chief trait was antipathy to war, and to any system organized with military energy, could scarcely develop great results in national administration; yet the Americans prided themselves chiefly on their political capacity. Even the war did not undeceive them, although the incapacity brought into evidence by the war was undisputed, and was most remarkable among the communities which believed themselves to be most gifted with political sagacity. Virginia and Massachusetts by turns admitted failure in dealing with issues so simple that the newest societies, like Tennessee and Ohio, understood them by instinct. That incapacity in national politics should appear as a leading trait in American character was unexpected by Americans, but might naturally result from their conditions. The better test of American character was not political but social, and was found not in the Government but in the people."

Mr. Adams gives a very circumstantial and accurate account of the negotiations at Ghent which resulted in the treaty of peace with England. The superiority of the American negotiators, John Quincy Adams, Henry Clay, James A. Bayard, Albert Gallatin, and Jonathan Russell, over the British plenipotentiaries, Lord Gambier, Henry Goulburn, and Dr. Charles Adams, is easily shown. The honors of the negotiation are frankly conceded to Gallatin. Only those who are familiar with the bitter controversy which subsequently arose between John Quincy Adams and Jonathan Russell concerning a disputed point in the negotiation can measure the forbearance practised by the historian in portraying the part which Jonathan Russell took in it. The only hint we have of this controversy, which for years contributed a new word to our political dialect, is the incidental statement that John Quincy Adams never forgot that Russell had once voted with Henry Clay against him in the matter of the fisheries and their retention under the treaty.

We have left ourselves no room for comment on the interesting generalizations with which Mr. Adams concludes his history, when summing up the results of the social and political evolution accomplished in the United States during the sixteen years covered by the Administrations of Jefferson and Madison. He thinks that in 1815, after the war had tested their political and social character, the people of the United States ceased for the first time to doubt the path they were to follow. The American was then ascertained to be, in his political character, "a new variety of man." And the results of the war gave a new direction to the whole social movement—"widening the breach between European and American tastes." The South and West gave to society a character more aggressively American than had been known before. In a word, "American character was formed if not fixed."

In so writing it seems to us that Mr. Adams has given the best of all answers to a moral more frequently pointed in these nine volumes than any other—the moral aimed at puncturing, as an historical delusion, the idea that the Republican accession of 1801 involved any real break with the Federalist practices of 1798. There *was* such a break. The American "variety of man" dates, in his political character, from 1801 rather than from 1798. The Federalists of 1798 worked on political ideals which had European, and especially Anglican, history behind them. The Republicans of 1801 pitched their ideals, for good and for evil, to the newly evolving forces of the popular democracy which had a history before it. And hence it was that Federalism melted into Republicanism during "the era of good feeling" under Monroe.

It would be ungracious if we should here take our leave of Mr. Adams and his important work without confessing the obligations due to him for unflagging industry, for critical research, for philosophical breadth of view, and for a high degree of literary art in fusing his copious materials into a consistent story. In the case of a writer who has such pronounced opinions, and who never disguises them, abundant room is left for challenging his point of view, but small room is left for challenging his accuracy in statements of fact. He was called to deal with the elements of a new formative epoch in our political annals, and the history of such epochs must needs be rewritten again and again, according to their divergent aspects, and according to the changed perspective of men in the drift of human events. But it will rather be in the interpretation of the facts than in the discovery of new facts pertaining to the sixteen years of Jefferson's and Madison's rule, that future historians of the same period are likely to win their best applause.

With Stanley's Rear Column. By J. Rose Troup, late Transport Officer of the Emin Pasha Relief Expedition. With illustrations. 2d edition. London: Chapman & Hall; New York: Scribner & Welford. 1890. 8vo, pp. xii., 361.

THE first chapters of Mr. Troup's book, giving an account of his duties in connection with the Stanley Expedition up to the time of his arrival at the entrenched camp at Yambuya, are the most interesting of all. He went directly to the Congo from England to provide carriers for the thousand and more loads of the expedition from the head of navigation to Stanley Pool. Having been three years an officer of the Free State, he was able to accomplish this task promptly and efficiently, so as to merit his leader's warm approval. From his simple narrative a good idea is obtained of the transport service of this part of the river, as well as of the character of the goods carried and the manner in which they are made into loads. He gives an animated description of a market in which the "perpetual and almost deafening roar of voices" seems to have been the most striking feature. In this district there were four markets held regularly in different places on successive days, and the "Congo week" consists of these four days. Another entertaining passage is the account of the departure of the expedition from Stanley Pool, Mr. Troup having joined it the evening before. Naturally he was disappointed on finishing his special work to find himself attached to the rear column, but he apparently took it in manly fashion, and finally reached Yambuya about two months after Mr. Stanley left that station for Lake Albert.

The record of his life in camp is for the most part dreary reading. It is composed principally of extracts from his diary containing little information of general interest. This is caused, however, by his voluntary omission of "reference to affairs of a purely personal nature as well as others that I thought it best to omit," moved, it is evident, by a proper consideration for the memory of his dead comrades. As Major Barttelot apparently did not treat him with ordinary courtesy at times, especially when he was ill, this reticence is very commendable. In an account of his first conversation with this officer, he says: "It did not take me long to discover that he had an intense hatred of anything in the shape of a black man, for he made no disguise of this, but frequently mentioned the fact." Whether this hatred was shown in action as well as in words, he does not disclose. The monotony of camp-life was broken by a visit to Stanley Falls, where Mr. Troup seems to have become convinced that Tippu Tib was acting honestly by the expedition, and that it was actually out of his power to furnish men sooner than he did. This was followed by a trip across country to the Congo, in returning from which he had a bad fall that brought on a serious illness, and he was sent home in the midst of the final preparations for the eastward march.

The closing chapter contains the author's correspondence with Mr. Stanley in respect to the charges made by him against the officers of the unfortunate rear-column. In connection with the "introductory remarks," we think that Mr. Troup clearly shows that Mr. Stanley was both unjust and ungenerous in much that he wrote concerning that column. It is plain to us that there was no disobedience to their instructions, but that, so far as moving the rear-column was concerned, the officers were perfectly justified in remaining in camp until they received the carriers Tippu Tib had contracted to furnish. He is equally successful in demonstrating the absurdity of some of the specific charges made against him personally, and we are unable to find any excuse for Mr. Stanley's persistence in making them. But we cannot agree with Mr. Troup in his contention that he was not to be held in any way responsible for the condition of the rear-column, because he was a subordinate officer. If he was convinced, as he apparently was from the beginning, that Maj. Barttelot was unfit for his position, he should have done what he could to remove him from it, by force if necessary, in the interests of the expedition. And in referring to such a measure as mutiny, deserving of death, he is writing pure nonsense. To a certain extent—how great we are not called upon to state—he must be held jointly responsible with the others, including Mr. Stanley himself, for the wreck of the rear-column.

The diplomatic correspondence respecting the formation of the expedition is given in an appendix. The book is attractive in its appearance, with several interesting illustrations and portraits and a map of the Congo.

Warren Hastings. By Capt. L. G. Trotter. Oxford: Clarendon Press; New York: Macmillan. 1890.

THERE is nothing new in Capt. Trotter's Life of Warren Hastings, which was written for the "Rulers of India" series; but it gives a fairly readable account of the life and doings of a most interesting man, and it describes a very important period of Anglo-Indian history. Hastings was the first Governor-General of all British India, for before his time the three Presidencies of Bengal, Bombay, and Madras had been independently governed; he held that office longer than any of his successors, and during eleven years he was incessantly contending with bitter adversaries who were also his official colleagues, with formidable enemies abroad, and with the factious animosity of a formidable political party in England. He did his country great and manifold services for which he obtained no reward; while his zeal for the public interest led him into some errors for which he was impeached by the House of Commons, and acquitted after the longest state trial on record.

The story has been often told, and Macaulay's glittering essay is well known; but on the whole the ill-luck of Hastings has survived even his death, for he has not been very for-

tunate in his biographers. Capt. Trotter does his best to explain the somewhat complicated events and transactions which have made this Governor-Generalship historically famous, and over which a sharp controversy had been kept up for more than a century—the Rohilla war, the hanging of the Brahmin Nand Kumar, the revolt at Benares, the duel with Philip Francis, and the treatment by Hastings of the Oudh begums. These things have furnished texts for some of the grandest orations in the English language and for some of the fiercest debates in the English Parliament; nor is Capt. Trotter to be blamed if the disputes are in these days mainly worn out and the discussions have taken a musty flavor. He is considerably entangled among outlandish names and places; he has to guide his readers through an unfamiliar Anglo-Indian phraseology; and perhaps he has scarcely succeeded in drawing a full-length portrait of Hastings, or in sketching the broad outlines of his policy.

Hastings was a bold, skilful, and masterly administrator, a true ruler of India, who set his country's advantage far above all personal wishes, and served it at the sacrifice even of his reputation. He carried his Government safely through one of the most perilous periods of Anglo-Indian history (1774–1784), when the English position in India was seriously threatened by two very formidable fighting Powers, Mysore and the Marattas, and when England herself was at war not only with all the maritime nations of Europe, but also with the American colonists. It is a remark of Sir James Mackintosh that Englishmen in a single generation lost one empire and gained another; he meant that they won India soon after they had lost their American possessions; and to Warren Hastings, more than to any other individual, it is due that England fared so much better in the Eastern than in the Western Continent.

While Capt. Trotter's work is somewhat defective in that breadth of treatment and artistic grouping of salient points which are needed to strike upon the popular mind clear impressions of confused incidents and remote scenes, he writes, nevertheless, with accuracy and good judgment, upon careful study of original records; so that this volume will be useful to those who desire to follow the course and understand the vicissitudes of a very remarkable career.

A System of Sight-singing from the Established Musical Notation. By Sedley Taylor. Macmillan & Co. Pp. 132.

One of the musical fads of unmusical England is the Tonic Sol-Fa system of notation—a partial return to antiquated mediæval methods, which has not found favor in the musical countries of Europe for the reason that it applies only to vocal and not to instrumental music, thus necessitating the learning of both systems, the Sol-Fa and the staff notation, while even in vocal music its advantages disappear in modern compositions, with their numerous chromatic intervals and constant changes of key. Mr. Sedley Taylor's book is an attempt to combine the advantages of the two systems. As he remarks on p. 115, "In the graphic up-and-down-ness of its pitch notation the staff has a very palpable advantage over the dead-level lettering of the Tonic Sol-Fa. It has been my object in the preceding pages to show how we may keep unbroken hold of the *tonic principle*, which is the soul of the T. S.-F., without sacrificing the *pictorial representation of pitch*, which is the special and conspicuous merit of the staff notation." He justly complains that most vocalists can sing nothing but what they have carefully learned beforehand, like school-boys who can only read from their own books; and he holds that "the complicated repulsiveness of the pitch notation in the old system must be held mainly responsible for the humiliating fact that, of the large number of musically well-endowed persons of the opulent classes who have undergone an elaborate vocal training, comparatively few are able to sing even the simplest music at sight."

Unquestionably our present notation is capable of simplification and improvement, but we doubt if anything is gained by an alliance with Tonic Sol-Fa. The pupils in the solfeggio classes of our national conservatory read music readily, and if such books as Riemann's or Ritter's on Dictation were more generally used, sight-reading would be a less rare accomplishment. It is all very well for the Sol-Faists to speak about "throwing at the singer's head a mass of gratuitous complications for which the assumed convenience of players on instruments with only twelve notes in the octave forms the sole excuse," but it must be remembered that it was Bach who was chiefly instrumental in securing this device, which is to be regarded as one of his greatest achievements in behalf of practical music. Mr. Taylor's attempt to help out his plan with darkened and colored lines and spaces is more ingenious, we fear, than practical. Nevertheless, there are many valuable suggestions in this book, which may be cordially commended to all teachers and students who take a more than merely mechanical interest in their art. The style is clear, and the publisher's work gives the book an elegant and distinguished appearance.

Appendiculæ Historicæ; or, Shreds of History Hung on a Horn. By Frederic W. Lucas. London: Henry Stevens & Son. 1891.

Mr. Lucas is the possessor of a curious relic of early American wars in the shape of a powder-horn on which is engraved a rude map of the Hudson, the Mohawk, Lake Ontario, Lake Champlain, the St. Lawrence, and parts adjacent, with the towns and forts pertaining to them. In explaining this curiosity, Mr. Lucas quotes a passage from Parkman's 'Montcalm and Wolfe,' in which, speaking of the New England militia at Lake George in 1755, that writer says: "At their sides were slung powder-horns on which, in the leisure of the camp, they carved quaint devices with the points of their jack-knives"; and Mr. Lucas adds that his horn also, on close examination, proves to have been carved with the point of a knife and not with a graver's tool. Such powder-horns are not uncommon. They are often, in spite of the difficulties of the case, engraved with maps or attempts at maps, though Mr. Lucas's horn is a remarkably elaborate specimen of this untutored cartography. His book is devoted to illustrating and interpreting this curious performance, which may have been the work of one of Rogers's rangers in 1757 or 1758, or of some New England soldier encamped with Amherst on Lake Champlain in 1759. In any case it does credit to the artist's ingenuity and patience.

Mr. Lucas's exposition is extremely comprehensive and far-reaching. He begins with a chapter on the discovery and exploration of America, from pre-Columbian times to the year 1600, followed by another on the early settlements, a third on the contact of Indians and Europeans, a fourth on the wars down to the year 1755, and then several others telling the story of the last French war, during which the horn came into being. All these chapters are well-executed compendiums.

Then comes the section of the book entitled *Tabula Cornea*, in which the author follows with skill and research the indications furnished by the horn, and gives an excellent résumé of the topography of the regions in question, together with facsimiles of maps, some of which are so rare as to be almost inaccessible in the original. This feature of the book gives it substantial value to students on this side of the Atlantic, as do also Mr. Lucas's notes and his list of authorities, which indicate diligent research. Besides the very valuable maps, the book is illustrated with a portrait of the horn, and a projection *in plano* of the curious tracings upon it.

Spectacles Contemporains. By Vte. E. Melchoir de Vogüé. Paris: Armand Colin & Cie.

In this volume of newspaper and magazine articles, M. de Vogüé has, as he says, "endeavored to note down some moments of contemporary history." The earliest, on "Affairs of Rome," dates from 1887; the latest, that on the opening up of Africa, which is compiled from different books, was published in October, 1890. Although these end articles are well done, in the author's familiar light style, the chief interest centres in those on "The Death of William I. of Germany," "Letters from Asia [the Inauguration of the Samarcand Railway]," and "Gen. Loris Melikoff." It is curious to see a French ex-diplomat striving to be impartial, in print, to the conqueror of his country. He succeeds very well, but adds nothing new to our knowledge, whatever effect his writing may have produced at the moment, which is now somewhat antiquated, according to our rapid notions. The letters from Asia are lightly written in an easy, picturesque way, with occasional well-turned epithets; but one gets, on the whole, a poor view of the famous opening ceremonies because of the very facilities which the writer enjoyed, on account of his relationship by marriage to Gen. Annenkoff, the builder of the railway. Delicacy prevents decided reference to the personal details and (through apprehension of over-friendly estimation of the family talent) to the engineering difficulties. Hence, there is an element of weakness where strength would have been looked for by people acquainted with the state of affairs. The article upon Loris Melikoff, on the other hand, is a perfect cameo portrait of a remarkable and highly interesting man. Melikoff's career, which is instructive in many ways, and was run at a peculiarly exciting epoch of Russian modern history, is handled with precisely that amount of sympathy and criticism which sets both the biographer and his old acquaintance in the most favorable, yet also the most just, light. It constitutes an important page in the perplexing Russian situation preceding the death of Alexander II., and its value lies in its coming from the pen of a foreigner whose endeavor is to be always honorable and impartial about a country with which he has the advantage of personal knowledge.

A Memoir of George Cruikshank. By Frederic G. Stephens. [The Great Artists.] Scribner & Welford.

The illustrator of the 'Sketch-Book' and the 'Comic Almanack' has not been fortunate in his biographers. Mr. Blanchard Jerrold was very ill-qualified for the task. Mr. Stephens is more critical and better informed, but his

mind is disorderly, and his style careless, discursive, and involved. His personal prejudices and literary and political predilections cannot be repressed. He jealously calls Prof. Wilson "this lumbering impostor of an admirer," and says that his "clumsy, half-tipsy, or quite tipsy exercises . . . in what he was pleased to call 'Noctes Ambrosianæ' (the popularity of which is one of the wonders of literary history), gave him occasion to praise George Cruikshank." Again and again he seeks to make his memoir an anti-home-rule tract; and with a fine deficiency of the sense of humor *ex officio* ascribable to him, he avers that "no account of Cruikshank approaches completeness which does not take note of the terrible indictment embodied in his illustrations to Maxwell's book [the 'Irish Rebellion']." This is 'The Verdict' with a vengeance.

The life of a caricaturist is preëminently in his work; and the biographer who has not unlimited facsimiles at his command, is under the necessity of describing design after design with the certainty of wearying both himself and his readers. We sympathize with Mr. Stephens in this particular, and can but applaud his courage in appending to his own narrative Thackeray's *tour de force* called an 'Essay on the Genius of George Cruikshank' (1840), in which the writer's own genius is taxed to vivify these descriptions of plates not visible to the reader's eye. Even he admits, as he nears the end, that "it is very difficult to find new terms of praise, as find them one must, when reviewing Mr. Cruikshank's publications, and more difficult still (as the reader of this notice will no doubt have perceived for himself long since) to translate his designs into words, and go to the printer's box for a description of all that fun and humor which the artist can produce by a few skilful turns of his needle." This Essay occupies half of the thin volume, and in point of readability is much the better half. Both parts are freely sprinkled with facsimiles, both rare and familiar, and at the close there is a chronological list of the principal books illustrated by Cruikshank.

Fathers of Biology. By Charles McRae. London: Percival & Co. 1890. 8vo, pp. 108.

THAT biology has a history reaching back more than twenty centuries will come to many as something of a revelation. Fully occupied with the present, the past has had none of their attention, and a vague idea has established itself that this branch of science, like geology and others of recent prominence, has no history worthy of notice previous to the current century, or at furthest before the time of Linné. Mr. McRae's neat little volume efficiently dispels this impression by tracing the advancement of our knowledge through the lives of Hippocrates, Aristotle, Galen, Vesalius, and Harvey—as he aptly styles them, fathers of biology. A better choice of men could not have been made. Each marks an epoch that is a decided advance upon that of his predecessors. Excellent judgment is also shown in the selection of the facts presented. The book is the result of a careful study of the best sources of information. The sketches are complete in themselves, yet the connections and the amount of dependence are sufficiently evident. It is apparent from their records that the great claim of these early biologists to our remembrance and gratitude rests on their accurate observations. These have been built into the foundations of science, but their theories have been thrown aside or forgotten. Comparisons of conditions indicate that future histories based upon the present will not differ greatly in these respects from those of the past.

Attractive and short, the essays before us are such as one enjoys in his half-hours of leisure. The volume is a good one to put in the hands of any naturalist, young or old, whose conception of his science has become narrow and distorted through exclusive attention to modern progress.

The Hittites: Their Inscriptions and their History. By John Campbell, M.A., LL.D., Professor in the Presbyterian College, Montreal. Toronto: Williamson & Co.; New York: A. D. F. Randolph & Co. 1890. 2 vols., 8vo, vii. 399, iv. 349.

No ancient inscriptions have more stubbornly resisted attempts at decipherment than the Hittite; they have excited keen interest, but they remain, along with the Etruscan, among the unsolved problems of our day. Lenormant and Halévy have hazarded conjectures as to Hittite ethnography, Sayce has offered tentative translations of inscriptions, and Conder has undertaken to read them all; but the learned world has remained unconvinced, and has declined to venture an opinion on the question whether the Hittite language is Semitic or non-Semitic. It is all the more interesting, therefore, to find a man who offers, as Prof. Campbell does, what he believes to be a perfect key to the enigma.

The quantity of material collected in these two volumes is enormous, ranging over the whole world. Drawings of the inscriptions have been furnished the author by Mr. W. H. Rylands of the Society of Biblical Archæology. The work is divided into two parts; the first treating of the decipherment of the inscriptions, the second tracing the history of the Hittites from a point three generations before Abraham. "The materials for this history," says Mr. Campbell, "are furnished by the Egyptian and Assyrian monuments, by the Greek historians, and by almost universal tradition, arising from the fact that the Hittites were in many respects the greatest of ancient peoples, and constituted the substratum of all early civilizations." Accordingly we have chapters on the Hittites in Palestine, Edom, Egypt, Mesopotamia, Western Asia, Eastern Asia, and America. Historical episodes, hitherto unknown, are narrated at length, and the history of the world assumes an undreamt-of unity. Hindus and Japanese, Italians and Aztecs appear as brethren; it is possible from this point of view that we ourselves are in part Hittites. These conclusions are reached by an unrestrained use of all existing historical and linguistic material. Hittite words are explained from the Japanese, Corean, and American vocabularies. The value of the characters is obtained from the Cypriote syllabary, the Corean alphabet, and the Aztec hieroglyphics. The Hittite first personal pronoun and substantive verb are found to be identical with those of the Lesghian, the Basque, the Corean, the Aztec, and other languages. "Turanian" is the name which our author adopts for this widespread family of languages. The new historical combinations made in the work are beyond computation. Tyndarus, King of Lacedæmon, father of Helen, is stated to be another form of the Syrian Hadadezer. The Semitic deity Baal is explained to be nobody but Bela son of Beor, the first Edomite king. The Iroquois League, we are told, goes back to the time when Chaldean Kings of Hittite birth called themselves lords of the four races.

Sober evidence for this enormous construction of history Prof. Campbell does not offer. The study of the material he has so laboriously collected has not unnaturally aroused in him an enthusiasm which has blinded his eyes to the principles of critical investigation. He permits himself to combine things which have no connection with one another. The Hittite monuments are worthy of study, but they will yield solid results only to patient, scientific examination. The volumes under consideration do not further the solution of the question. Even the collection of historical data is dangerous; facts and fancies are so commingled as easily to mislead the unwary reader.

Hannibal: A History of the Art of War among the Carthaginians and Romans down to the Battle of Pydna, 168 B. C., with a detailed account of the Second Punic War. With 227 charts, maps, plans of battle, and tactical manœuvres, cuts of armor, weapons, and uniforms. By Theodore Ayrault Dodge, Brevet Lieutenant-Colonel, U. S. A., retired. Boston: Houghton, Mifflin & Co. Pp. xxiii., 682.

THIS is the second in the "Great Captains" series prepared by Col. Dodge. The first traced with fulness the career of Alexander of Macedon; the present covers the development of the Roman military system, and shows how it was perfected under the severe teachings of Hannibal. Like Napoleon, the great Carthaginian taught his enemies by numberless defeats, till they mastered his art and learned how to defeat him with his own weapons. The organization and instruction of both armies is analyzed with minute care, and every point is lavishly illustrated.

The debated questions regarding Hannibal's Italian campaigns are treated in much more than common detail, especially the question of the route he followed in crossing the Alps when first invading the Latin territory. Although Col. Dodge follows in the main the conclusions of Mommsen, he marshals the evidence from which the conclusions are drawn, and fills the story out with whatever authentic material has survived, and thus gives local color and increased interest to the whole. He has gone over the ground with his Polybius in his hand, and judged for himself the questions of strategy, in regard to which the conformation of the ground is often decisive.

Compared with the Alexander, there would seem to be a purpose to make the style more colloquial, with an occasional approach too near to slang as the result. Clear-cut simplicity is of all things to be most desired in a military narrative, and this is consistent with a high level of dignity, as well as with terse and idiomatic English. The Hannibal reaches this level generally, but there are some marks of carelessness which suggest a caution. The volume is in many ways a model for treatises of the kind, and the authentic copies of arms and equipments from ancient monuments are a constant aid as well as pleasure as one turns the pages.

Life of Richard Brinsley Sheridan. By Lloyd C. Sanders. [Great Writers Series.] London: Walter Scott.

BY a stroke of good fortune, the author of the "School for Scandal" has at last found a friendly biographer. Until now almost the only biography of Sheridan which was not evidently hostile or offensively "superior," was that prefixed to an American edition of

his two chief comedies issued in Boston five or six years ago. Watkins was a political opponent; Moore was a trifler who betrayed his hero; Prof. Smyth was another traitor, whose book drew from Sheridan's granddaughter, the Hon. Mrs. Norton, a castigation as severe as it was deserved; and Mrs. Oliphant combined the acme of incompetence with the utmost carelessness. It is scarcely disputable that Mrs. Oliphant's sketch of Sheridan is by far the most slovenly volume in the series of "English Men of Letters," which Mr. John Morley has generally maintained at a high level. It is pleasant to be able to record that Mr. Sanders's sketch of Sheridan is one of the very best volumes in the series of "Great Writers"—perhaps it may even be called the best after Mr. Austin Dobson's admirable biography of Goldsmith.

Mr. Sanders is not blind to Sheridan's very obvious faults, and he makes no attempt to gloss over his many failings. He has gone to the sources for his facts, although he is able to add but little to the discoveries of earlier investigators, except possibly in his fuller use of more recent political biographies to illustrate Sheridan's public life. He has been unusually successful in the proportion of his biography: the literary career of Sheridan and the political are well balanced against each other; and there is no effect of broken continuity when we pass from the chapters treating of the production of the "School for Scandal" and the "Critic" to that treating of the trial of Warren Hastings at Westminster and the Begum speech.

There is a sufficient index; and to this as to the other volumes of the series Mr. John Anderson of the British Museum has appended a bibliography consisting chiefly of a transcript of the entries in the British Museum catalogue, with a few stray additions from Poole's Index and elsewhere.

Imperial Germany. By Sidney Whitman. [Vol. 2691 of the Tauchnitz Edition of British Authors.]

THE first edition of this reprint was published in London in 1888. It is not remarkable for anything unless it be extravagant praises of the beauties of paternal government, and slipshod, not to say ungrammatical, English. It may be warmly recommended to college examiners in English who are in search of rank specimens of "English as she should not be wrote." The following examples may serve out of the many with which the book is studded:

"The pen that indites therein an anti-German article, has nobody at its back, but he who holds it in his hand, the single individual, who produces this lucubration in his study, and the protector that a Russian paper usually possesses, some high official who has got entangled in party politics, and who perhaps happens to grant this paper his protection, both weigh but as a feather against the authority of his Majesty the Emperor of Russia." (P. 276.)

"Some people aver that even now there are very few items the Germans produce that they do not owe their latest improvements to English or American ideas." (P. 249.)

"Thus at the Academy of Vienna, in the year 1880, there were 400 pupils in piano playing, and of these 350 were girls, most of whom were presumably let loose on the community as piano masters and mistresses." (P. 59.)

"This school holds that parliamentary party government is unsuited to direct the destinies of a great nation; that the opinions of a majority offer no guarantee of its soundness." (P. 93.)

"The cost of forcing the concessions through Parliament have in course of time cost the companies millions." (P. 113.)

The author devotes a whole chapter to Bismarck, and his admiration for that statesman warms him into a series of metaphors that might have excited the emulation of Sir Boyle Roche. Some of them deserve preservation; the three that follow are average samples:

"After being identified for years with open antagonism to the Papal See, it must have cost his pride no trifling pang to step out lustily on the road to Canossa—he, a stanch Protestant—smoking the pipe of peace with the placidity of an honest purpose." (P. 130.)

"Also the thunderbolts that the late M. Gambetta hurled from his jaws only served to reëcho the cry of a defeated country." (P. 140.)

"Bismarck's is not a nature we can imagine turning out well-oiled periods or emitting polished Ciceronic shafts. But if his periods are nervously jagged and lack rotundity, they fly as straight as a dart, and, where they strike, they pierce the enemy through and through, and thence pursue their winged course right across the country, to be remembered as sledge-hammer blows of conviction and hard-striking reason." (P. 141.)

Royal Edinburgh; Her Saints, Kings, Prophets, and Poets. By Mrs. Oliphant. With illustrations by George Reid, R.S.A. Macmillan & Co. 1890.

IN the present work Mrs. Oliphant appears as the real Scotswoman devoted to her illustrious country and its glorious capital. Not that she ever disguised her Scottish nature, or wrote a word untrue to it. But here she drops the English households and Florentine painters that have so often and so well occupied her pen, and comes forth as the historian of her own "land of cakes." The book is not a topographical guide or an architectural handbook. A large number of the striking buildings and spots in Edinburgh are reviewed, but solely as the scenes of touching and picturesque incidents in the lives of illustrious men and women, high dames and mighty earls, princes, prophets, and poets. The Castle and Holyrood, St. Giles's and the Kirk of Field, the Cowgate and the Canongate, the Nor' Loch and the Lawnmarket, are there; but as soon as the fortunes of the drama point to other spots, the Maiden City is left, and other scenes, Falkland and St. Andrew's, Stirling and Perth, await the reader, while the story of the hero or heroine is discussed. It is a book of persons, not of places, and one who did not know Edinburgh well already would gather but a fragmentary notion of it, and acknowledge that he could find a better guide-book in the 'Heart of Midlothian.'

Mrs. Oliphant begins with one long and interesting chapter on the person through whom the wild Celtic kings of Scotland were first brought into relations with the empire and the other great kingdoms of Europe, Margaret the Atheling, great-grandmother of Henry II., and Queen of Malcolm Ceanmohr. She traces with a loving hand the memorials we possess of this remarkable woman, who, almost single-handed, founded a home in Scotland for all the arts of refinement and culture which that age possessed, and brought camp and cottage under the softening influences of the Court and the Church. Passing lightly over the remarkable monarchs of Margaret's blood who did so much for Scotland in two centuries, and likewise saying but little of the strife for the throne and the reigns of the Bruces, Mrs. Oliphant devotes half-a-dozen chapters to the "Stewards of Scotland," as she somewhat fantastically calls the Stewart family—Robert II., Robert III., and the five Jameses.

To the strange fascination which hangs round every member of this ill-starred house, except, perhaps, Robert II., the author surrenders herself entirely. The strange succession of brilliant and sombre adventures—the coronations in childhood, repeated again and again, the captivities, the assassinations, the civil wars—the gorgeous pageantry and the ghastly crime which seem to blaze and lower over every step of the Stewart line, take possession of her whole being. She has studied the ancient historians diligently, and when they do not afford material enough for her, she does not hesitate to draw avowedly on her imagination to paint in full the gorgeous or crimsoned scenes which she thinks the books have sketched too lightly. She will not let one of the Stewart kings depart without a blessing. It is hard work with all except James I. Even through the halo of the fifteenth century, they all have too much of the qualities that overthrew them in the seventeenth—self-will against the wisest counsellors, weak devotion to the most unworthy favorites, recklessness in rewarding services, implacability in the pursuit of injuries, rashness where caution was most needed, timidity where firmness might have saved them. The early Stewarts were constantly trying to govern well, and as constantly finding out that no king that ever lived can govern a country all by himself, especially if he contrives to alienate most of its great men. We suspect that if James IV. could rise from his nameless grave at Flodden he would never know his own portrait as Mrs. Oliphant draws it.

It is rather disappointing, when one looks for Edinburgh under the most celebrated of the Stewarts, to find three chapters following the adventures not of Queen Mary, but of John Knox and George Buchanan. Not that it is a mistake; for readers nowadays are likely to know much more of the Enchantress Queen than of her two greatest subjects, and Mrs. Oliphant's account of them is lively and valuable. It is very amusing to see how she deals with the question of the Queen's guilt. Professing to leave it aside, she finds it forcing itself upon her notice, and, like Scott in 'The Abbot' (she is Sir Walter's own child in literature), she does not quite know what to do about it. She wants very much indeed Queen Mary to be innocent; she sees the irrelevance of many of Knox's charges; yet she equally sees the absurdities involved in the position of the Queen's defenders, and, on the whole, she is very glad that saying what she has got to say has taken up so much room that she has to leave out the main issue.

The book closes with interesting and appreciative chapters on the three poets whose connection with Edinburgh, whether long or short, was so important in its influence on their literary career—Allan Ramsay, Burns, and Scott.

The Goodwins of Hartford, Connecticut, Descendants of William and Ozias Goodwin. Compiled for James Junius Goodwin. Hartford: Brown & Gross. 1891. 8vo, pp. 798.

IT appears from the preface that the American portion of this genealogy was prepared by Mr. F. F. Starr, while the English notes were furnished by the Rev. Augustus Jessopp of Scarning, England, and by Mr. Henry F. Waters, whose knowledge extends over Old and New England. The American portion shows a commendable industry in collecting the history of a widely spread race, few of whose members have arrived at great distinction; but this labor is rendered almost useless by the adoption of a peculiar system of arrangement which renders it almost impossible to trace any individual or to form any idea of the extent of the branches. It is cumbrous,

and, in its system of cross references, very unnecessarily expensive. As we have often said in these columns, it is passing strange that genealogists will deliberately ignore the simple and well arranged plan used in the *New England Historical and Genealogical Register*, and throw all their valuable material into a shapeless mass.

As to the English portion, the ancestors of the two emigrant brothers, William and Ozias Goodwin, are still to be found. It seems certain that one Robert Woodward of Braintree County, Essex, in 1640, gave ten shillings to his daughter Mary, wife of Ozias Goodwin, now in New England. But even with this most valuable clue the emigrants have not been found among the Goodwins of Essex or of Suffolk. It seems that the search has not been abandoned, and if any living man can be expected to succeed, certainly Mr. Waters is the one. We sincerely trust that this success is not far off, and then we may hope to see the publication of the volume herein referred to, which shall give the full results of the search among the remaining evidences of the Goodwins of Blaxhall and other families of the name.

Sir Francis Drake. By Julian Corbett. [English Men of Action.] Macmillan & Co. 1890 209 pp. 8vo.

A SATISFACTORY life of Drake is still to be written. Those which have appeared hitherto have been defective, imperfect in method, inaccurate in detail, though they could not be uninteresting. The little volumes of the "Men of Action" series are not to be judged as elaborate biographies, yet we may reasonably expect to find the main facts and dates somewhere stated in a sober manner, or, as reasonably, be annoyed if we do not. In the present case we do not. The narrative is turgid and pretentious; its affectation of insight into the workings of all men's minds, at the time of Drake's adventures, is irritating in its absurdity: one knows not whether that which is stated here is an attested fact, a surmise of the author, or an excursion of unbridled fancy. The book is destitute of nearly everything which should characterize a good biographical sketch. Yet so extraordinary was Drake's career, so heroic his adventures, so romantic his daring and his success, that, like others before him, Mr. Corbett has not been able to make his tale unreadable, nor entirely deprive his work, however feeble, of the brilliancy reflected from his subject.

Even if it had been pure fiction, the book, for its proper understanding, should have had a map. Considered as biography or history, the absence of such a key to its better comprehension is difficult to explain.

BOOKS OF THE WEEK.

Arène, P. The Golden Coat. Harper & Bros. 50 cents.
Allen, William Francis. Essays and Monographs. (Memorial Volume.) Boston: Geo. H. Ellis. $2.
Austin, A. The Human Tragedy. Macmillan & Co. $1.75.
Aveling, E. An Introduction to the Study of Botany. Macmillan & Co. $1.10.

Fine Arts.

PORTRAITS AT THE ACADEMY.

WHATEVER may be the general average of merit at the spring exhibitions at the Academy, in one branch at least of the painter's art, and a most important one, the display is always good. There is usually a considerable number of excellent portraits, and sometimes one or two of surpassing merit. If the hanging is badly done, if quiet pictures are placed in jarring contrast with noisy and obtrusive ones, if good pictures are often placed over doors and very bad ones on the line—if, in short, the general aspect of the annual exhibitions is not what it might be if the Committee were allowed to work with no other recommendation for putting pictures in good places on the walls but their merit—the portraits somehow make themselves felt, and this year is no exception. There is bad hanging and confusion of tone, but half-a-dozen notable works in portraiture have been very well placed, and they constitute the most interesting feature of the exhibition. Mr. Sargent's beautiful portrait of a young lady in a pink gown with gray ribbons, holding a couple of orchids in her hands, "Portrait," No. 230, must be classed among the best of his works, and it is one of the most charming of all of the portraits of women he has painted. Another portrait from his hand, that of a gentleman, "Portrait," No. 388, is life-like and most cleverly done. It seems as though the painter had "forced the note" a little in this head as in other recent work, such as the portrait of Joseph Jefferson, now at The Players, which was exhibited in the last autumn exhibition at the Academy. The reds and blues are violent, and it looks as if the artist made them so purposely, counting on the effects of time to give tone and not detract in strength from the painting. As they are now, freshly painted, these pictures are rather harsh and just a little common in color. No such criticism, however, applies to the portrait first mentioned. The young lady is suavely and delicately painted; and while the color scheme is not on the whole a striking one, such as it is it is pleasing and harmonious, and the canvas is one of the most attractive which this very able painter has yet shown.

Very good work in drawing, in modelling, and in the observation of values is contained in the excellent picture, by André Castaigne, "Portrait," No. 454, a young man, in a black velvet jacket, sitting astride a chair; and there is excellent painting, much dignity and repose, and the most competent sort of general treatment in the portrait of a lady by Mr. Vinton (No. 162). It is solid and luminous, and if it only had just a trifle more individuality in it, it would overstep the line that divides thoroughly good work from masterpieces. It is good enough as it is, though, to be ranked with the best portraits of the year, and it undoubtedly shows Mr. Vinton at his best as a painter of portraits of women. Mr. Beckwith, too, is notably successful in characterization in his picture of a lady in street costume, "Portrait of Mrs. A. R. F.," No. 103, quite as skilfully handled as any of his better work and particularly clever in the treatment of the dress; and there is a head of a lady by Alfred Q. Collins, "Portrait of Mrs. L.," No. 468, which, in spite of a distressingly aggressive blue gown, is a nice canvas to look at because the head is pleasing and the painting good enough to study. There is something good in the way of sobriety and force, and not a little quaint charm, in the large picture of three little girls, "Portraits of the Misses H.," No. 279, by Eleanor Norcross, but it is placed over one of the doors and cannot be more than half seen.

Mr. Chase has painted the portrait of a well-known artist, "Portrait," No. 118, in just about the way one painter ought to paint another—without the slightest affectation, seriously, and with more thought of things artistic than of those other annoying things that friends of the philistinic sitter are always imposing on the portrait-painter in the way of costume. Mr. Whittredge has seated himself in Mr. Chase's studio, palette in hand and a canvas before him, and Mr. Chase has apparently occupied himself with the problem of making the picture on his canvas look as much like what he had before him as possible. There isn't any composition—it is a study on a large scale, but it is a very good study, it is a very life-like picture, and it is painted with all Mr. Chase's knowledge. His knowledge, it may be said, is seen in this canvas quite as much in what he has made little of as in what he has most insisted upon.

Mr. Blashfield's "Portrait of a Lady," No. 134, is an excellent work and one of the very good things of its class in the exhibition. It is hung higher on the wall than it deserved. A full-length portrait of a lady (No. 54), by Joseph F. Mathews, has been very badly placed in a dark corner of the corridor. It is quite impossible to see it except by gas-light when the exhibition is open in the evening, and that is not much better than not seeing it at all. It seems to be very good, and enough of the lower half of the canvas receives light upon it to show that the dress is well painted and interesting in color. William Bailey Faxon in "A Lady's Profile," No. 5; Harper Pennington, in a striking portrait of a boy (No. 49), C. Coventry Haynes, in "Portrait," No. 69; J. Wells Champney, in a pastel head of a lady (No. 76); Will H. Low, in "A Girl in Black," No. 101; W. Howard Hart, in "Study," No. 106; Samuel Isham, in "Portrait," No. 220; Robert Gordon Hardie, in "Portrait of Prof. E. Charlier," No. 322; Howard R. Butler, in "Portrait," No. 380; S. Mary Norton, in "Portrait—Mother and Child," No. 393; A. Menocal, in "Portrait of Mr. G.," No. 465, and Charles Noël Flagg, in "Portrait of Mark Twain," No. 378, are among the artists who have contributed other notable works in the class we are speaking of, and whose pictures for one reason or another deserve to be mentioned among the better things on the walls.

"A really fresh, vigorous, and highly interesting story."—N. Y. Tribune.

JERRY.

By S. B. Elliott. 12mo, $1.25.

Our Dictionaries and Other English Language Topics.

By R. O. Williams. 12mo, $1.25.

Contents: I. The Growth of Our Dictionaries (with four facsimiles of Title-pages and Frontispieces). II. The Word "Metropolis," as used in England and America. III. Some Peculiarities, Real and Supposed, in American English. IV. Good English for Americans. V. Cases of Disputed Propriety and of Unsettled Usage. VI. Indexes.

Johnston's Shorter History of the United States.

By Alexander Johnston, Professor in Princeton University. 340 pp. Teachers' price, 95 cents; by mail, $1.06.

From S. W. Mason, Supervisor in charge of history in the Boston (Mass.) Public Schools: "Since the publication of Johnston's larger work, I have considered it the best book extant for the advanced pupils in our schools. I always recommend it to teachers who desire to do the best thing in the best way with the best instrument. I have carefully read the shorter history with increasing satisfaction. I did not see how so good a book could be written. I do not now see how a better book can be written."

Clark's Briefer Practical Rhetoric.

By J. Scott Clark, Professor in Syracuse University. 307 pp. Teachers' price, 90 cents; by mail, 98 cents.

HENRY HOLT & CO. New York

BURR'S LIBRARY INDEX.

FOR INDEXING SUBJECTS, TO AID THE STUDENT, SCHOLAR, CLERGYMAN, LAWYER, PHYSICIAN EDITOR, AUTHOR, TEACHER, AND ALL LOVERS OF BOOKS.

All Words and Names are indexed by the first TWO Letters, with nearly 400 divisions of the Alphabet, printed in Thumbholes cut in the edges of the leaves.

Opened instantly at any combination by the use of one hand!

An Index to information for immediate or future use.

Write for descriptive circular and price.

LITERARY LANDMARKS

A Guide to good Reading for Young People, and Teachers' Assistant. With Charts and Original Designs, and a list of the best books which cover the necessities of School Libraries, Teachers' Books, and Children's Reading.

By MARY E. BURT,

Formerly Teacher of Literature, Cook Co. Normal School, Englewood, Ill., and now Member of the Board of Education, Chicago, Ill.

"The signal distinction of this little volume is that it maintains the capability of children to be interested in the best imaginative works of the race, beginning with the Greek and Latin classics and continuing through Dante and Shakespeare. The method is to present the stories of the poet, and trace the development of the leading myths of the ancient world, the romance of the mediæval age, and the reworking of these materials by moderns. . . . Her book deserves the attention of teachers and of those who are interested in home education in books."—*N. Y. Evening Post.*

HOUGHTON, MIFFLIN & CO.,

The Nation.

NEW YORK, THURSDAY, APRIL 30, 1891.

The Week.

SOME whimpering is observable in the tone of the leading Republican newspapers on the subject of the national finances. Secretary Foster, it is stated, will soon issue a circular to the banks and "to large employers of labor," offering to exchange the fractional silver in the Treasury, amounting to something over $20,000,000, for paper. In other words, he finds a necessity confronting him of using an unavailable non-legal-tender fund to meet the current expenses of Government. It is not likely that either the banks or the large employers of labor will consent to any such exchange. The fractional coin is just as unavailable to the banks as it is to the Government. There is plenty of fractional coin in circulation now. When a cup is full, it will hold no more. If this twenty millions could be poured in, it would overflow and come back to the Treasury for redemption, and it would have to be redeemed too. The large employers of labor, if they are wise, will be chary about passing off upon their employees a kind of money that is not legal tender for more than ten dollars in one payment, and is bulky and inconvenient also. Such a course would be strongly provocative of strikes and would besides be politically unwise, since it would acquaint the working classes with the fact that the Government, which was left by the Cleveland Administration with an enormous surplus, is already in financial straits.

Near the close of the first session of the Fifty-first Congress, Senator Edmunds said in public debate that he apprehended that there would be a Treasury deficit before the 1st of July, 1891. That condition is evidently nearer than the public had supposed. What with pension profligacy, public-building profligacy, the direct-tax refund, and other squandering, coupled with the repeal of the raw-sugar duties and the increase of the tariff on other things, with the avowed purpose of preventing importations, the Secretary is in danger of seeing his last dollar unless he sells bonds to replenish his cash. This he has authority to do if he has the courage also. In the natural course of things he will be obliged to trench upon the $100,000,000 gold fund held for the redemption of the greenbacks. We say he will be obliged to do this, because he is obliged to pay his debts as they mature. The law has provided for a contingency of this kind by authorizing him to sell bonds to maintain specie payments. Accordingly, whenever he is for any reason short of money to redeem greenbacks with, he is not only authorized but required to sell bonds for this purpose. It may be a trial to his nerves, but it would be a greater trial if he should go to protest. There is a matter of $54,000,000 of 4½ per cent. bonds maturing on the first of September, and already we hear of plans to extend these bonds instead of paying them. This implies that the Sinking-Fund Law is not to be executed until Congress meets. This law requires the Secretary to redeem about $49,000,000 of the public debt during the fiscal year, which begins July 1, 1891. If the law were executed, it would very nearly extinguish the 4½ per cent. debt. But evidently it will not be executed in a hurry. The Secretary can wait till Congress meets. Then he can make recommendations as to the repeal of the Sinking-Fund Law *and* the imposition of new taxes. Altogether the financial situation of the Government is as bad as its worst enemy could desire. Fortunately this badness has not extended to private business, and it is not necessary that it should. The Treasury may be on its knees to the banks and the "large employers of labor" without the latter being any the worse for it.

President Harrison's remark at Galveston about subsidies to shipping, that, whether we approve of the principle or not, we must go into the business, inasmuch as "all other nations do," is a good illustration of the uncritical use of facts. It is very easy, for instance, to point to the example of France, and show how her generous bounty laws, for both the building and sailing of ships, have apparently had a strikingly good effect. In 1873 the French flag flew over only 292 steamers of above 100 tons, while the number had increased by last June to 471. Nothing could be more conclusive: no ships without subsidies. But how about the growth of the German merchant marine during the same time, without subsidies? In 1873 the steamers of German ownership above 100 tons numbered 200; last June they numbered 689. In 1888, Germany without subsidies succeeded to the second place among the nations using steam navigation, and France, under her bounty system, yielded it. Nor has the latter been outstripped solely in the number of craft and gross tonnage; she has nothing afloat to place beside the *Spree* and *Havel* of the Lloyds, or the *Columbia* and *Augusta Victoria* of the Hamburg-American Line. This splendid transatlantic service has been built up absolutely without subsidies. Why have the French lagged so far behind? It would interest President Harrison to read the explanation given by an old French captain in a late number of the *Monde Économique*. The trouble is all in the French subsidies, says this practical sailor; with a bounty assured for fifteen years, the steamship lines settle back in luxurious ease, let well enough alone, and leave it to unsubsidized Germans to utilize the latest refinements of shipbuilding. In fact, before advancing to the experience of "all other nations," it would do the advocate of subsidies a world of good to make a close study of the experience of France and Germany. It would at least show him how misleading and dangerous is an inference from an isolated set of facts.

A correspondent calls our attention, apropos of the New Orleans massacre, to the recently decided case of De Brissot and others against Venezuela, in which the defence interposed by the Venezuelan Government (*i. e.*, that the officers of the States of Apure and Zamora, by whom the injuries complained of were alleged to have been committed, were outside the scope of Federal authority and control) was overruled by the United States and Venezuelan Commission that closed its labors in Washington last September. All the passengers on board the steamer *Apure*, which was attacked at Apurito by forces from the adjoining State of Zamora, were Venezuelans. The steamer was the property of the Orinoco Steam Navigation Co. of New York, and the officers of the steamer, De Hammer and De Brissot, who were killed, and Stackpole, who was wounded, were citizens of the United States. There was no discrimination: several casualties occurred among the Venezuelans on board the steamer. Two of the three Commissioners held the Venezuelan Government liable for its failure to put the leaders of the attacking party on trial, although it was claimed for the Venezuelan Government that, by the Constitution of Venezuela, they were not subject to the Federal jurisdiction. The Venezuelan Government was held liable for damages by a majority of the Commissioners. There is no doubt that the Federal bond is looser in Venezuela than in the United States, and the Federal Government, therefore, less responsible for the doings or misdoings of the several States. Our latest treaty with Venezuela, that of 1867, provides for a commission such as has been sitting in the case above mentioned for the adjustment of American claims, whether of individuals or of corporations, against the Government of Venezuela, and we can only account for the late decision on the theory that the Commission holds it to be a simple matter for the Federal Government to coerce a State, owing to the long familiarity of the Republic with intestine wars and commotions.

The Republican National League, in session at Cincinnati, adopted on Thursday a platform which consisted of "glittering generalities," and elected as President ex-Assistant Postmaster-General Clarkson, after a letter had been read in which he constructed his own platform and indicated his idea of the issues which the Republican party should make prominent next year. This Clarkson platform is a most remarkable outburst of "gush." There is no end of rhetoric, but hardly a single defi-

nite idea in it. Take, for example, this passage:

"There are questions lying nearer the hearts of the American people to-day than the price of a tin cup or whether the color of the money of the realm shall be yellow or white. The greater questions are those of human liberty, the protection of the weak in their rights, the insurance, under the Constitution, of a republican form of government to the several States now without it, and as absolute security and peace to the poorest citizen and family on the Yazoo as to the richest citizen on the Hudson."

The insurance of absolute security and peace to the citizen, whether he be a poor man on the Yazoo or a millionaire on the Hudson, is a mouth-filling phrase; but the Supreme Court, in annulling the Civil-Rights Act for unconstitutionality, declared that the Federal Government had nothing to do with the insurance of security and peace to the citizen anywhere, and that any attempt by Congress to usurp such power would be promptly pronounced null and void, as in conflict with the Constitution.

The Michigan Legislature, which has a Democratic majority in the House, and a Democratic majority in the Senate also when the four Patrons of Husbandry vote with them, is just passing a law which makes a radical change in the manner of choosing Presidential electors in that State. The bill has already passed the House, and there is no doubt that the Senate will concur this week. Its effect upon the Electoral College of 1892 will be so marked that the whole country is interested in the measure. The Constitution provides that "each State shall appoint, in such manner as the Legislature thereof may direct, a number of electors equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress." For many years after the establishment of the Government, the common practice was for the Legislature to choose directly the whole number to which the State was entitled. In a few of the States, however, other systems were followed which tended in the direction of a decision by popular vote. Thus, in Massachusetts the people of each Congressional district nominated three electors, of whom the Legislature chose one, the two electors-at-large being also chosen by the Legislature. Maryland, Virginia, and North Carolina for some time chose all the district electors by popular vote in the districts, without any interposition of the Legislature.

There has always been more or less complaint against the existing system by which all the electoral votes of a State go to one candidate, even if he receives only a few more than half of the popular vote. In the early days of the Republic the party in power did not hesitate to make sudden changes in the way of choosing electors when it saw a chance of seizing an advantage. Thus, in 1812 Vermont, New Jersey, and North Carolina all had laws by which Presidential electors were to be chosen by popular vote. But just before the day fixed for the election the Legislature of each State repealed the existing law, and assumed the right to choose the electors themselves. In Vermont and North Carolina it was a Democratic majority in the Legislature which did this; in New Jersey, a Federalist. The opposition carried Michigan over the Republicans last fall, but they doubt their ability to repeat the performance in 1892. They feel reasonably sure, however, of carrying about half of the twelve Congressional districts, and one of the two large districts into which they will divide the commonwealth for the choice of the two electors-at-large. The chance of securing all fourteen electoral votes in a popular election is so small that they have concluded to make sure of several of the number by introducing the district system of choice. The enactment of this Michigan law throws Michigan into the category of doubtful States for 1892. The only sure thing about it is that the Republicans will not have all the fourteen electoral votes. The Democrats will have some, because they always carry more than one of the Congressional districts, but how many nobody can tell. If the result elsewhere throughout the country should be very close, we may have to wait for a careful count of the votes in some of the Michigan districts before we shall know who has been elected President.

Ohio is the latest State—the twenty-fourth—to adopt a ballot-reform law. The measure, so far as we can judge from the outlines of it published in the Ohio papers, is similar in its provisions to the Indiana and Maine laws. It provides for the Australian system of nominations and compartment voting, with exclusively official ballots, the names of all candidates to be grouped by parties in parallel columns upon a blanket ballot. The law has been secured in spite of the opposition of the leading Republican journals of the State, which have steadily ridiculed the Australian system as the "kangaroo reform." The popular demand for it was so great, however, that the Democratic majority in the Legislature had the aid of many members of the Republican minority in the final victory. With Indiana, Maine, and Ohio holding their elections under the reform system, it can be said at last that the chief citadels of corrupt voting in this country have been carried by the reformers.

Since the new Treasury ruling in respect to carpet wools went into effect, the duty on them has been advanced to nearly 100 per cent. ad valorem. And still the Ohio wool-growers are not satisfied. They have induced the Secretary of the Treasury to appoint a committee to recommend changes of the samples by which wools are classified for duty. Probably in the end they will get Bagdad, East India, and other coarse wools put into the first and second classes, dutiable at 11 and 12 cents per pound unwashed. Then by applying the washing clause and the sorting clause, they will get the duty up to 33 and 36 cents per pound respectively, which would be prohibitory. At all events, that is what they are aiming at, as Judge Lawrence is candid enough to say. Meanwhile, Ohio wool continues to decline. The remarkably low figure of 32 cents per pound was recently quoted in Boston, and unreported sales were made which were thought to be close to 31 cents. This is a decline of 7 cents per pound since the McKinley Tariff Bill became a law. But some other American wools have advanced in price. The class known as "Territory" has been steadily improving towards the character of clothing wool, thus putting further off the day that Judge Lawrence predicts, and Uncle Jerry Rusk sighs for, when we shall "produce all of our own carpet-wool." The far Western wool-grower, with a perversity unexampled in the world's history, works and breeds towards high-priced instead of low-priced wool. This carries him further and further away from the rôle assigned to him by Lawrence and Rusk. It has had another effect, which none of the parties in interest anticipated at first. It has evolved a wool that works admirably as a mixture with Australian. Hence the large importations from Australia (double those of any former year), and the advance in the price of Territory wool. Hence also the comparative neglect of Ohio fleeces. What Judge Lawrence really needs is not a duty of 100, or 200, or 300 per cent. on carpet wools, but a law to prevent manufacturers from mixing different kinds of wools together. It is this infernal Australian-Territory compound that is doing the mischief.

Until the details of the so-called reciprocity agreement with Spain are made public, it is of course impossible to say just how far they go. The telegrams from Madrid have been sufficiently confusing. But, in any case, it is altogether ridiculous for the *Tribune* to say that "American diplomacy" had given Spain the alternative of reciprocity or a revolution in Cuba. Cuban complaints of the commercial policy of Spain do not date from yesterday or the day before, nor have they any very great connection with the reciprocity clause of the McKinley Bill. There is one feature of that measure which mightily afflicts the Cubans, and that is the increased taxes on tobacco. But that article does not figure in the reciprocity clause, and it is significantly reported from Madrid that negotiations over tobacco have been deferred to a later date. If Mr. Blaine could offer Cuba free tobacco in return for free flour, then indeed it might be a question of a revolution were Spain to refuse. But that offer can now only be made by means of a reciprocity treaty properly so called, and Spain will believe in it when it passes the Senate. Meanwhile, it is not to be supposed for a minute that Cánovas was frightened by any threat of imposing duties on Cuban sugar. He remarked some months ago to a Cuban delegation that the November elec-

tions in this country showed the popular disapproval of the McKinley Bill, and that there was no occasion to live in fear and trembling on account of it. The truth is, Spain has been for ten years steadily liberalizing her commercial policy in regard to her colonies, and these latest concessions to the interests of colonial trade are but one step more in a path long travelled. A sliding scale of duties which Cuban products were to pay in the Peninsula was made law in 1882, under the terms of which all duties whatsoever were to disappear by July 1, 1892. And the same law provided for the abolition of the Cuban tariff, as against Spanish products, on July 1, 1891.

The latest case of "journalism" is that which the *Herald* supplies by censuring Mr. Cleveland for denying the accuracy of an interview with himself on the part of Mr. Stephens, the State Treasurer of Missouri, which the *Herald* published in its evening newspaper and then transferred to its morning newspaper, the *Herald* proper. The interview was on the subject of silver and silver legislation, and it went far to contradict and neutralize the letter which Mr. Cleveland wrote to Mr. E. Ellery Anderson some weeks ago. Mr. Stephens denies that he has had any interview with any reporter, and he surmises that somebody has had an interview with somebody who has had an interview with him (Stephens), but that the interviewer in the second degree has got things badly mixed in the published report. Mr. Cleveland contented himself with a general denial of the accuracy of the pretended interview. Now what says Jefferson Brick in the columns of the *Herald*? Why, that "Mr. Cleveland believes himself to have been misrepresented by Mr. Stephens." Neither Jefferson nor any body else connected with the *Herald* has seen Stephens at all, or had a word with him. But the sin of believing himself to have been misrepresented by Mr. Stephens must be expiated. So Jefferson asks whether Mr. Cleveland "has a silver policy for the East and another for the West and South." Then, waxing righteously indignant at the skulking, double-tongued Cleveland, he begs to inquire whether he remembers "the fate of the accommodating weather-vane that presented itself to all the winds of heaven, and swung serenely upon its pivot until an unaccommodating cyclone came an unexpected way and carried it off into the uttermost part of nothing." That is the right way to put it. Jefferson never said anything better than that. He makes it hot by anticipation for all other persons who have not been interviewed by the *Herald*, and who think that they are liable to be misrepresented by interviews imputed to them.

The increase of the population of Rhode Island during the decade between 1880 and 1890 was absolutely greater than in any preceding decade, and relatively greater than in any except those between 1840 and 1850 and 1870 and 1880. The census bulletin giving the population of the State by minor civil divisions shows, however, that this increase was not evenly distributed. Of the thirty-six cities and towns which existed in 1880, thirteen, even after allowance is made for the effect of change in boundaries, have actually lost inhabitants. Examination shows that, as in New Hampshire and Massachusetts, this loss has fallen most heavily on the smallest towns. Again, in Vermont, of the 244 cities and towns whose population was separately returned both in 1880 and in 1890, more than three-fourths (or 186) had fewer inhabitants in the latter year than in the former. Essex is the only county in which the majority of the towns have not lost population in the decade. In the six southernmost counties of the State more than six-sevenths (or 111 out of 129 towns) show a loss, while in the two southeastern counties of Windsor and Windham, out of 47 towns only 5 (or less than one-ninth) have more inhabitants now than they had a decade since. As in the other New England States, the rule has been that to them that have shall be given, and the gains have been in the larger towns.

The English Ministry have apparently got themselves into another nasty little mess in the Evelyn vs. Hurlbert case. Mr. W. H. Hurlbert was sued by an actress named Evelyn for breach of promise of marriage. She had no adequate proof of the promise, but she had a batch of 150 rather disgusting letters to her in what she and other witnesses swore was the plaintiff's handwriting. He said that they were not written by him, but by a man named "Wilfrid Murray," who was at one time his secretary, and had learned to imitate his handwriting so successfully that he himself could not detect the difference. But he could produce no one who knew or had ever seen this Murray, and the Judge in his charge commented strongly on the improbability of the story. The jury thereupon found a special verdict—not "for the defendant" generally, but that "there was no promise of marriage," leaving the authorship of the letters an open question. The public then said, naturally enough, that, although it was plain there had been monstrous perjury on one side or the other, the verdict left it unsettled which it was, and that there must be further inquiry in the shape of a criminal prosecution. This criminal prosecution can only be instituted, however, at the instance or with the permission of the Attorney-General, and the Attorney-General, in answer to a question in the House of Commons on Thursday night, said the Government were considering the matter. Here is where the politics comes in. The Attorney-General, Sir Richard Webster, was, apparently very indiscreetly, as in the Pigott case, Hurlbert's counsel, so that he is now considering whether he will prosecute his own client or the plaintiff for perjury in a case in which he was himself engaged professionally. From this it would appear that Sir Richard had not learned wisdom from his annoying experience before the Parnell Commission.

The explanation of his taking Hurlbert's brief, however, seems easy. Hurlbert, who has been for some years resident in England, took it into his head, or had it put into his head by the Liberal-Unionists and Tories, to write a book on Ireland, and, although he knew nothing about Ireland, he promptly produced the book, which showed, from personal observation, that the Home-Rulers were a bad and dishonest lot, and the landlords kind, good men, and the government of Ireland an admirable one. It had a good sale, and furnished the Tories, as coming from a disinterested foreign observer, a most useful defence against the wicked Radicals and Separatists. Indeed, the *Spectator* put it on higher than merely political ground, for it said the book was the work of an "American Catholic," who was far more troubled by the moral condition of the Irish than by their economical condition. Consequently it is now of some importance to the Conservative party to keep Hurlbert up on this lofty moral plane, where the Radicals and the Separatists cannot get at his character. Hence the Attorney-General's willingness to appear in the case.

The Manipur troubles in India are apparently approaching their close, but they well illustrate the risks and difficulties attendant upon all dealings between civilized and barbarous men. The rebellious captain of the half-armed, undisciplined soldiery of one of the most insignificant States has been able to inflict a sharp blow and serious humiliation upon the powerful government of a great Asiatic empire. Just fifty years ago the British Resident in Afghanistan, Sir William Macnaghten, was seized and assassinated at an interview with the leaders of an Afghan insurrection; and twelve years ago, Sir Louis Cavagnari with all his escort. But Afghanistan is to Manipur what a tame cat is to a tiger: if one goes among bloodthirsty fanatics, the slightest imprudence is fatal. There were, indeed, symptoms that the Manipur usurper would fight rather than surrender; yet English officers are so accustomed to carry matters with a high hand and to trust in the enormous power behind them for overawing resistance, that the dispositions for arresting him were evidently made carelessly. The result has been a lamentable loss of life, the discomfiture of a detachment of British troops, and a temporary fall of British credit among the natives of India, who do not dislike to see some of the conceit taken out of the unconquerable Englishman. It is not improbable that the affair may cause some fermentation among the half-subdued tribes in the vicinity of Manipur, and we may hear of sporadic outbreaks on the two borders of the wild country that lies between India and Burmah, which contains a peculiarly restless and intractable population. All overt resistance to the advancing reinforcements will be easily put down, and Manipur itself will be occupied without trouble; but the English reputation for skill, adroit daring, and for the favor of Fortune—a goddess much beloved in India—has received an awkward scratch.

SECRETARY TRACY'S DUTY.

When Secretary Tracy put Commander Reiter in command of the *Thetis*, a very attractive post, the impression made by the act on the public was very well expressed by that ardent Republican journal, the Philadelphia *Press*, as follows:

"The restoration of Commander Reiter to a command in the navy is not as complete a reinstatement nor as gracious as the Secretary of the Navy ought to have made it. The vessel assigned to him is inferior to the one from which he was taken. Nevertheless, the public will be disposed to look upon Reiter's reinstatement as an acknowledgment, partial and tardy though it be, that the hasty action of last January, under which Commander Reiter was censured and suspended, was ill advised and unjust."

But the Secretary, instead of letting the matter be just where the *Press* puts it, tries to minimize the importance of his tardy and imperfect atonement, by insinuating that he still thinks Commander Reiter unfit to command a man-of-war, and has therefore only given him a surveying-ship, "which does not carry a single gun."

All this is very unworthy of the Secretary, and most mischievous as regards the service. Nothing could more effectively illustrate the danger of introducing politics into the management of the military and naval and diplomatic service than this Barrundia incident has done. Our diplomatic service is, unhappily, now and has long been wholly given over to the politicians, so that when Mr. Blaine determined to make capital out of Barrundia's death, and in doing so to sacrifice Mr. Mizner, there was, although Mr. Mizner had a perfect answer to Blaine's charges against him, little or nothing for the outside world to say. Mr. Mizner is an independent man, who knew well when he accepted a foreign mission what he was about, and to what risks such service in our country would expose him. He knew there was no security of tenure in it, and he knew that when Mr. Blaine was placed at the head of the State Department, he (Mizner) might any day be "decapitated" with or without cause.

But hitherto the army and navy have been kept out of politics. The officers in both services have had nothing to fear from political jobs and intrigues as long as they did their duty as defined by the United States statutes and by the regulations. Secretary Tracy, in order to help Mr. Blaine in his jingo venture in Guatemala, broke through this valuable tradition, and proceeded to sacrifice a naval commander on the same altar as Mizner. He wrote to Commander Reiter insulting letters, and inflicted on him illegally, as the best authorities believe, a public reprimand in time of peace without trial before a court-martial. When the matter came to be examined, it was shown clearly enough that he had no case in law or morals against Commander Reiter. No lawyer and no newspaper of any weight came to his aid. When assailed in the House by Mr. Dalzell, he had no one to put up against him but Mr. Lodge, who made a bunkum and irrelevant speech, and attempted one bit of deception, by giving his audience to understand that Hall, in his 'International Law,' made a distinction between the duty of a naval commander in a foreign port towards a fugitive reaching him by sea and one reaching him by the shore.

The debate left the Secretary in an extremely uncomfortable position, because it revealed the fact that he had wantonly and unjustifiably attacked a subordinate officer, in both his private and professional character, without a shadow of right. His conduct since then explains why the law and usage put officers in the military and naval services under the protection of courts-martial. Their reputation as officers is their whole fortune and all they have to bequeath to their children. Therefore, says the law, it shall not be assailed except before an impartial court, where the accused can be fully heard and have the advice of his friends in making his defence. It shall not in time of peace be subjected to any one person's caprice, or passion, or conceit of power, or pride of opinion. The decisions of courts-martial can be revised, overruled, or modified, but there is no appeal from the abuse or obloquy or degradation inflicted by an individual superior, who may be an enemy, or an intriguer, or a party politician. No officer shall, therefore, be placed at any one man's mercy. Could there be a better illustration than the Reiter case of the wisdom of all this?

The effect of the affair on either Gen. Tracy's reputation or Commander Reiter's has, however, comparatively small importance. The public aspect of it is of vast importance, and the Secretary must be urged to deal with it. Both Mr. Mizner and Commander Reiter acted in the Barrundia affair not only in accordance with the law of nations as laid down in all the text-books, and as settled by United States precedents, but with the ruling of Secretary Bayard in the Gomez case so late as 1885. Here is his despatch to Mr. Hall, then our Minister in Nicaragua:

"[No. 226.]

"Department of State,
"Washington, March 12, 1885.

"Sir: I have to acknowledge the receipt of your No. 316, of the 10th ultimo, in which you enclose copies of the correspondence between the Legation at Guatemala and Mr. Leavitt, the United States Consul at Managua, respecting the case of José Dolores Gomez, and request more definite instructions for such cases.

"It appears that Mr. Gomez, who is said to be a political fugitive from Nicaragua, voluntarily took passage at San José de Guatemala for Punta Arenas, Costa Rica, on board the Pacific Mail steamship *Honduras*, with the knowledge that the vessel would enter en route the port of San Juan del Sur, Nicaragua.

"The Government of Nicaragua, upon learning of this fact, ordered the commandant of the port of San Juan del Sur to arrest Gomez upon the arrival of the *Honduras* at that port.

. . . . . .

"It is clear that Mr. Gomez voluntarily entered the jurisdiction of a country whose laws he had violated. Under the circumstances it was plainly the duty of the Captain of the *Honduras* to deliver him up to the local authorities upon their request.

"It may safely be affirmed that when a merchant vessel of one country visits the ports of another for the purposes of trade, it owes temporal allegiance and is amenable to the jurisdiction of that country, and is subject to the laws which govern the port it visits so long as it remains, unless it is otherwise provided by treaty.

"Any exemption or immunity from local jurisdiction must be derived from the consent of that country. No such exemption is made in the treaty of commerce and navigation concluded between this country and Nicaragua on the 21st day of June, 1867.

"I am, etc., T. F. Bayard."

Now, it would appear from the action of the Department of State and of the Navy Department in the Barrundia case that both Mr. Blaine and Gen. Tracy dissent from Mr. Bayard's view of the law, and dissent with such vehemence that they consider that any officer who acts on it is punishable as for a crime or offence. If this be true—and they have taken great pains to call attention to it—they are bound to furnish both the public and the army and navy with a full and authoritative exposition of the law, as they understand it, touching the powers and duties of our naval officers commanding public ships in foreign ports. Since the Reiter case the navy is left absolutely without guidance. The officers can simply guess from what happened to Reiter, in the first instance, that they may get into trouble for not rescuing foreign fugitives from their own police; but from what has happened since he took the command of the *Thetis* they may also guess, that the only consequence of such trouble would be their transfer to a more luxurious ship without guns. So that the whole subject is surrounded with obscurity and confusion. They ought to have an official statement of the law in black and white. The abusive letters to Commander Reiter do not contain any such statement. We have pressed Secretary Tracy to give us one, but in vain. He will not even say what statute or regulation Commander Reiter has violated. This is a most dangerous situation, and if any further trouble arises out of it, Secretary Tracy will be responsible, and his responsibility will be more serious than Mr. Blaine's, because he has a very different reputation from Blaine's to maintain. He is a lawyer, and has passed until now as a sober-minded, fair-minded, and safe man.

THE IMMIGRATION PROBLEM.

Our suggestion, week before last, that the only really practical and useful test to apply to immigrants was the English-language test, has called forth more or less comment from the press in various parts of the country. Some commend it cautiously; others think well of it, while perceiving the impossibility of getting it embodied in legislation. The Hartford *Courant* thinks it "too severe," and suggests in its stead the application to voters at the polls of the test of ability to read English. The Rutland *Herald* also proposes this test for naturalization. The New York *Press* suggests that the immigrant should be required, we presume at the wharf, "to read and write his or her own language." It may as well be said plainly, however, that no test to be applied to voters will contribute in the smallest degree to the solution of the immigration problem. When once a foreigner lands here and gets a residence, no test can long keep him from taking part in the Government. Not only are all the influences of the time opposed to restrictions on the exercise of the

electoral franchise, but the political parties, especially in the great seats of population, are bent on making a voter as soon as possible of every foreigner they can set eyes on whose vote they think they can secure for their own side. Consequently, there is not a large city in the Union in which the managers of both parties would not combine to make nugatory at the polls any test of either intelligence or character. Both the reading and writing tests in any language would speedily be made a farce. Every party worker in a political canvass feels that the duty nearest him is to win the election, and not to save the country from ignorant or vicious voters. The only place to apply tests of fitness to the immigrant is either the port of departure or the port of arrival, before the politicians catch sight of him. If he is once let loose, all precautions about him are idle.

The *Times* offers as a substitute for our suggestion "a substantial poll-tax." It says truly: "That the immigrant was able to pay this would be evidence that he was a person of some substance and of frugal and industrious habits, and it would thus be the very best guarantee we could have that he would be a useful member of American society." In order, however, to put a substantial poll-tax into operation we should first have to make a successful fight for the principle of the thing—which would be no easy matter, for we should have to face the deep popular dislike of a property qualification. After this we should have another fight, and a more desperate one, in order to make the poll-tax "substantial." The most strenuous opposition would be offered to any sum which would really indicate previous thrift or good social standing in the Old World, and it wou'd be backed by the enormous number of more or less successful citizens of foreign birth in various parts of the country who landed without a cent. When something of this sort was proposed in the House a few years ago, one of the members from Minnesota, a Norwegian by birth, and a prosperous and much-respected resident of the State, rose up and said that any such tax would have shut out his mother when she came here with several fatherless children. A very few such protests and illustrations would sweep the scheme away under a torrent of popular indignation. If not totally repudiated, the tax wou'd be cut down to an amount which would simply make it a slight increase in the cost of the ocean passage.

We confess freely that our suggestion about the English-language test was an academic and not a practical suggestion. It is, in our opinion, the only test which, if applied, would accomplish the objects at which those who are most alarmed about the flood of foreign ignorance now pouring in on the country, are aiming. It is the one which a wise and benevolent despot, if put in charge of the Government at this crisis, would apply at once. It is the only one which can be defended *à priori*, *à posteriori*, and *à fortiori*. It is true it would shut out a large number of immigrants, especially Germans, who would be of great value to the country; but so would any test whatever, except idiocy or crime. Under any other test we can think of, we should reject a host of possible Andrew Jacksons, Lincolns, Grants, Greeleys, and Schurzes. Probably every shipload of immigrants contains the makings in abundance of statesmen, soldiers, and scientists of the first order. But the great objection to the English-language test is a fatal one, namely, that there is not the smallest chance of its being adopted.

One has only to read the report of the proceedings at the Republican Club Convention to see plainly that no political party will, at present at least, further a measure of exclusion on any grounds. One of the resolutions proposed the prohibition of further immigration of paupers and criminals, and "people so alien that they cannot be assimilated in the body politic." When first introduced, the Convention seemed delighted with it, but when two or three speakers from the Northwest announced that as it stood it would ruin the party in that region, the last clause was promptly stricken out. So it will be in every party convention as long as the foreign vote is as large and distinct as it is now. There will be much complaint about the conduct of Europe in pouring her floods of barbarism over the continent, and much description of its evils and horrors in Fourth of July orations and Thanksgiving sermons, but nothing will be done to check it. We are passing through a crisis of immense and rapid material development, accompanied by what may be called legislative paralysis touching all schemes of construction and purification. Vigorous legislation cannot be procured except in aid of attacks on property, or in aid of schemes for the rapid accumulation of property through some form of protection. The care of the moral and intellectual interests of the country seems to be left wholly, or almost wholly, to the colleges, the growth and development of which in every direction constitute, perhaps, the most remarkable phenomenon of the close of the century; but the effect on legislation will not be visible for some years.

THE SAVING REMNANT.

THE fact that 456,707 voters in this State, in a total of 1,460,295 who had taken the trouble to register in October of last year, declined to go to the polls in November, continues to excite attention in the press of the State. Various reasons are given for this remarkable abstention, amounting to nearly one-third of the entire registration—the most generally accepted being that advanced by us last week, namely, Republican dissatisfaction with the McKinley tariff. Several Republican commentators admit that this was a more powerful cause than any other, but declare their belief that it will not be in operation when the next election comes around, because the voters have discovered already that they allowed "Democratic clamor" to prejudice them against a bill which was really a most beneficent and wise measure.

Without discussing the probabilities of a return of these missing voters to any particular party, we wish to call the attention of the leaders of all parties to the fact that there is a very large body of voters, mainly Republican in their tendencies, who are susceptible to independent influences, and therefore do not vote blindly with their party. They have not been able to go over to the Democratic party, as many other former Republicans have gone, but have simply reached the point where they will not vote at all rather than vote their party's ticket. The Republican party can win them back only by convincing them of the wisdom of its policy. The Democratic party can gain their confidence and support only by showing them that it is more worthy of trust than the party with which they are dissatisfied. They have begun the dangerous practice of thinking in politics, and, like all other voters who have taken that step, they will never be "safe party men" again. Their minds will be open to the reasoning and appeals of independent men and journals, and the uncertainty about their conduct on election day will increase with every campaign.

It is not necessary to point out that one-third of all the voters of the State is a sufficient body to constitute a formidable balance of power. Whichever side gets the support of that third is certain to win. This is the fact in the situation in this State which ought to give reformers the highest encouragement. It is to this unmoored third that they should address their arguments for genuine ballot reform and for separate national, State, and municipal elections. Therein are to be found the voters who will listen to them, and will sooner or later follow them and carry their causes to success in spite of weak-kneed and tricky politicians in both parties. The voter who has begun to think about tariff legislation, has begun to think about the effects of other kinds of legislation, and the more he thinks the more of a menace will he become to the legislators who stand in the way of the enactment of desirable laws.

The election in this State in November is likely to turn largely on State issues. Undoubtedly the nearness of the Presidential contest of next year will have some effect, but it will scarcely be a deciding one. The tariff can only be brought in as an extraneous issue, for there will be no election for Congressmen, and no reason for introducing national issues beyond the general one of getting the moral effect of a victory for one party or another in the Presidential campaign. Gov. Hill's partisan and selfish administration of his office has not been calculated to win for his party the support of the abstaining third of last November's voters. In fact, the municipal elections of the spring showed very plainly that many thousands of the abstaining third in all parts of the State had returned to the Republican party, temporarily at least, for that party showed striking gains in nearly all localities. Whether they will remain with the party in the November elections is a point about which speculation is easy, but we should say that their conduct would be decided by what the party and its candidates stand for in the contest.

Neither party will come out of the legislative session with such a record as will prove attractive to thinking voters. No distinctive reform measure has been passed or can be expected, and one reform measure, the Ballot Law, has been so amended that, in case the Governor approves the changes, it will be converted from an inadequate reform statute into an extremely partisan one. For this transformation, both political parties are to be held to account, for the representatives of both have united to make it. The attention of the thinking third of voters ought to be directed to the necessity of sending to Albany men who would devote their energies to giving us genuine reform in this and other directions, and the advocates of the various reforms which we have already enumerated cannot exert themselves to better purpose than by the dissemination throughout the State of educational literature on those questions. The county table of abstaining voters shows that they were pretty evenly distributed over the entire State, the proportion of absentees to the total registration being about the same in all cases. A campaign of education would be certain to bear fruit, and would be certain also to show both political parties the necessity of taking a stand either for or against the reforms in the platforms of their conventions.

MOLTKE.

THE death of Gen. von Moltke leaves a great gap in the list of distinguished military men in Europe, and presents the problem whether another hand can wield that great but complicated machine, the German Army. His career as a soldier has been as remarkable for its unlikeness to that of other renowned generals as for its wonderful successes. It has been the fashion to think a great leader of armies must be a young man in the height of physical vigor and ambition; but Moltke directed his first campaign when he was sixty-six years old. Other generals have learned their duties and tested their capacity in inferior commands in actual war, but Moltke had never been in an important battle nor commanded even a battalion in the field. He might not unfairly be described as a theoretic student of the military art, who was called upon to direct great campaigns when he was already an old man. This certainly was true so far as strategy was concerned, though the administrative work of the army might be partly learned by experience in time of peace.

He was not of titled origin, and was not made Count till the fall of Metz in 1870. Born on October 26, 1800, at Parchim, a little town in the Grand Duchy of Mecklenburg-Schwerin, he entered the Danish Army as a cadet when he was a mere boy, but was transferred into the Prussian service soon after he became of age. At thirty-two he was assigned to staff duty, in which he permanently remained. In 1835 Sultan Mahmud asked the temporary assistance of Prussian officers in the reorganization of the Turkish Army, and Moltke was one of those who were appointed to this service. By the Sultan's request he was allowed to remain in Turkey till 1839, when, on Mahmud's death, he returned to the Prussian staff. In this interval he had advised and directed the improvement of the Turkish fortresses in Bulgaria, and the intelligence with which this had been done was very significantly acknowledged by the Russians nearly twenty years later. On his return home he published in 1841 a memoir, on the condition of Turkey, which is still an authority in matters pertaining to the "sick man's" estate.

In all this there was nothing strikingly different from the experience of other well-instructed staff officers of his time. The long peace which followed the downfall of the first Napoleon continued unbroken, and though all the great Powers kept up their immense standing armies, there was little for the ambitious staff officer to do but to perfect the administration of the peace establishment and perfect himself in the theory of his art. At forty-two Moltke was only major in the staff, though noted as an officer who was reported to have mastered and well digested everything that had been written on the art of war, ancient or modern. He had practical familiarity with and easy use of seven languages, and was a clear-headed and indefatigable student.

In person he was of medium height, slender rather than stout, but compact, vigorous, and active. He had the genius of system and the rare faculty of enforcing his own ideas of order and accuracy, without losing the character of amiability and comradeship. His talents were recognized, and for the thirteen years preceding 1859 he was for the most part the military adjutant of one of the royal princes, or chief of staff of a corps. At the last-named date he was made Chief of Staff of the Army with the rank of Lieutenant-General, and then, as he was entering his sixtieth year, his great career may be said to have begun. Yet hardly another career of modern times shows so plainly the effect of long and systematic training for the precise work he had to do. For half-a-century he had been fitting himself for this thing, and seems to have followed resolutely such a regimen of body and mind as would be likely to keep all his powers unimpaired, and preserve for him the physical strength and mental elasticity which might best realize the proverbial "old head on young shoulders." When we follow him in the Bohemian campaign of 1866 against Austria, and the French campaign of 1870–71, it requires a positive and conscious effort for us to realize that before these great events were over he was an old man of seventy.

The reorganization of the Prussian army was not the work of one man or of one generation. It began in 1813 under Stein and Scharnhorst, and has been steadily progressive. It does not appear that Moltke has made any radical changes in the system. A succession of able war ministers, ending in Gen. von Roon, had brought the organization to a high pitch of accuracy and harmony, and Moltke's pre-eminence consists in his having been the man to direct and handle the great army in actual war, with a systematic skill in strategy and a strength of grasp in the multitudinous details which should be worthy of the splendid organization itself. King William doubtless spoke from his own complete knowledge of the fact when, in the banquet after the surrender at Sedan, he toasted Gen. von Roon as the minister who had whetted the sword of Germany, and Gen. von Moltke as the arm that had wielded it.

Moltke's method of wielding it, however, was only possible by reason of his having prepared the way for it by a long course of education and discipline of the officers who were to carry out any plan of campaign. He was himself a lucid and attractive lecturer, and succeeded in inspiring the staff schools with an enthusiastic interest in their work. He systematized the knowledge efficient officers should possess, put them in the way of getting at it in every department, and taught them how to make it practically available. A constant interchange of line and staff duties kept the staff at ease in the actual discipline, drill, and handling of troops, and in the administration of the business of each corps and division. Special talents were marked and recognized wherever they appeared, but no officer was excused from responsibility for the most accurate and prompt performance of every duty pertaining to his post, whether high or low.

He made a study of the cause and cure of the common discrepancy between the nominal and actual numbers in an army. The detailing of men from the ranks for administrative duties was practically abolished. Teamsters were enlisted for that duty, and formed a corps by themselves, including a certain number of train guards. Stretcher-bearers and ambulance men were organized in the same way. So were hospital attendants and the like. The battalion must mean so many effective men under arms whenever a campaign should open, and the officers in command were held strictly responsible for the agreement between the figures and the fact. The looseness of administration in France turned out to be so great that hardly two-thirds of the nominal strength of the army could be assembled under the colors, while the German force corresponded accurately with the staff estimates, and was renewed from the depots, the reserves, and the *Landwehr* with mathematical certainty and regularity.

Nothing was left to chance, little to the invention or the inspiration of the moment. It was intended that the arms of the German soldier should be, if possible, better than those of his enemy; at least, they should be as good. It was intended that his drill, equipment, physical condition, and mental and moral forces should all be superior. It was intended that a superior number of these equally brave, equally strong, equally armed men should meet the enemy at the critical points. The means of locomotion by railway or on foot, the scientific use of these means, the capacity of trains, the endurance of men's bodies, were all calculated as the physicist calculates forces and resistances in the laboratory, and were perfected with a scientific care which should make the practical campaign in the field as certain to realize the plan as the skilful professor's experiment in public realizes the theory elaborated in his study. In all this Moltke was the professor of the art of war; the army, the staff, the telegraph, and all the tremendous military engines of modern warfare were the apparatus by which he exhibited to the world the startling demonstration of the scientific distinction of a dynasty and a great military power. He did not appear with dazzling decorations at the head of the army in the field; a plain, thoughtful man in his cabinet, out of sight of the troops and out of hearing of the guns (for the most part), manipulated the wires which carried orders as they might have carried an explosive spark to a mine or a torpedo.

In the Austrian campaign of 1866 the King and Moltke did not leave Berlin till the three converging columns, from west, from north, and from east, were nearly united in front of Sadowa, and a strategic success was practically secure. In 1870 the King and Moltke did not enter France till the victories at Wörth and on the heights of Spicheren had

been won, till the armies of Steinmetz and Prince Frederick Charles were under the walls of Metz, and the army of the Crown Prince was turning the line of the Moselle by the south. Yet here again, in a strategic point of view, the campaign was already decided; the French were put upon a passive defensive, and the blows followed each other with such relentless continuity and force that no opportunity was given for new combinations or for reorganization. The French Emperor had thought that he was ready and could seize the initiative as the first Napoleon had done. Gen. Leboeuf, his chief of staff, had assured him that all was prepared, "to the last gaiter-button;" but a single month taught him a sad lesson as to the true meaning of military preparation.

French critics have, not unnaturally, pressed the question how all this would have worked if the initial success had been on the other side. Would the German system have appeared so good if put upon the defensive? No doubt the successful initiative is more than half the battle; but the value of a system and the ability of those who direct it are shown in securing this advantage. It is for this that all the great and elaborate preparations are made. Still, we have every reason to believe that Moltke had studied the defensive as well as the offensive campaign, and was prepared for the state of things which would have existed if the French had been first to cross the Rhine. We certainly know that his army would not have found, as the French did, that they had been supplied with maps of the enemy's country only, and knew less of the topography of their own land than their opponents.

There still remains the important question how far instruction, discipline, and system may be perpetuated so that results may be secured by men of average natural abilities, and how far (now as heretofore) it is the great leader that is necessary to combine, to direct, and to command victory by his personal superiority of mind and will. This is the problem the German Empire has to solve; and, even granting that Moltke has introduced a more scientific spirit into military affairs than has ever before been known, it does not follow that his successor will be found able to make equally clear and true combinations of the great forces under his hands. Admitting that war is a collision of forces guided by fixed laws, and keeping up the analogy with the laboratory use of other forces, we must still remember that not every physicist is a Tyndall nor every chemist a Bunsen. The man counts for much in combinations of the strictest science.

In war, however, there is an element of another sort. The conditions of the problem cannot all be foreseen. There is truth in the old habit of regarding it more like a game of chess than the combination of the scientist in the laboratory. The variability of circumstances is so great that, after all has been done that scientific study of the fixed forces can do, there is still room for the master of the art to make combinations which shall disjoint and derange the purposes of his adversary in proportion to his superiority of insight and of nerve.

It looks, at first sight, as if all the subordinates in the Prussian Army had been educated in their duties to a pitch which made them independent of their chief. In the campaigns of both 1866 and 1870, the orders issued to army commanders seem very simple and brief, and nearly everything appeared to be left to their discretion. Indeed, many of the most important directions were framed as suggestions more than commands. The initiative in what proved a great battle was on several occasions taken by a corps or even a division commander, with undoubting confidence that it was sufficiently in accord with the general plan, and that the rest of the army would certainly come to the sound of the cannon. This was sometimes in very striking contrast with the rigidity often shown by officers of a regular army in limiting themselves by the letter of their orders.

On occasions when German generals were intrusted with independent movements, they have seemed to use a strategy as bold and a vigor as great as when acting with the principal column. This was notably the case in 1866, when the column under Gen. von Falckenstein, and afterwards under Gen. Manteuffel, prevented the mobilization of the Hanover troops, captured or defeated them in detail, separated the Bavarian Army from its allies, again defeated first the one and then the other, and completed the campaign with an éclat hardly inferior to that of Königgrätz itself, though upon a smaller scale.

Such facts show the high degree of proficiency in their art which is attained by the general officers of the German Army; but it forces our attention, at the same time, to the other fact that this is the result of systematic and continued education enforced in time of peace. The Austrian and the French wars only disclosed the results of many years of close application to study of their art by officers of all grades in the Prussian service, under rules which allowed none but thoroughly well-instructed men to advance to the command of a division or a corps. In the highest departments of this work Moltke had been himself the instructor, bringing into personal relations to himself and under the influence of his own lectures such men as Voigts-Rhetz, Blumenthal, Stiehle, and others, who distinguished themselves as chiefs of staff to the royal princes or as corps commanders. Such men needed only to be informed of the general plan of campaign — the details they could work out for themselves; and they were so indoctrinated with the importance of accuracy of performance of subordinate parts, as to both method and time, that they could be reckoned upon to be at the right place at the right moment, as confidently as a railway manager would reckon on the carrying out of his schedule by the conductors of the various trains.

We cannot think of Moltke without recognizing the advance in the art of war which he brought about by this introduction of the modern ideas of scientific and business exactness, based upon full knowledge of the conditions under which an army must be used, and of the principles controlling its organization and handling. This part of his work will survive him, and the good results of his system may be seen for generations to come in an abundant supply of officers in the German Army whose education in their art will compare favorably with the preparation which the great universities offer to men who devote themselves to other professions and to the sciences. Yet he was more than an organizer and instructor; he was a great strategist. His insight into the great game of war was that of a master, and his systematic calculations in the details were subordinate to his unrivalled grasp of all the varying conditions of the problem, physical, mental, and moral. It would be rash to predict who his successor may be in this the highest qualification for a great general, or how long a period must elapse before his own country or any other will look upon his like again. It is a unique testimonial to his powers that, when almost ninety years old, the whole world as well as his own countrymen looked to him to conduct a new campaign, if war should occur, without a thought as to his age, or a doubt that his action would be as vigorous as if he were but forty.

THE FIRST JAPANESE PARLIAMENT.

Tokio, March 7, 1891.

It may be said of the first session of the Japanese Parliament, speaking theologically, that it should seek a justification by faith and not by works only. The chief anxiety was not, What will it do? but, In what spirit will Parliament and Government meet in this their first encounter? The important question now is not, What work has Parliament accomplished? but rather, What was its temper and its capacity, its bearing towards the Ministry, the character of their mutual relations, and their respective positions before the nation at the end of the session?

Looking back upon the past four months, the facts that stand out are, first, the conciliatory and statesmanlike attitude of the Government; secondly, the strength of the Lower House. Three most important Government measures—the immediate enforcement of the Commercial Code, the Advocates' Bill, and the Budget—have been either crippled or rejected. but defeat has been accepted with a resignation which was quite unlooked for. The reduction of the Budget has ruined many cherished projects and seriously hampered the Administration; but fairness, temperateness, and readiness to yield their prerogative have characterized the Ministry on almost every occasion.

That the Lower House (for, except in the case of the Advocates' Bill, the Lower House has been chiefly responsible) was strong enough to inflict these blows is the other notable fact. Whatever may be said of the wisdom of some of its acts, it is clear that it has drawn its strength from the nation itself, and this the Government has not failed to recognize. The signal victories of the people's representatives have been those in which public opinion had already been clearly indicated. That the spirit, however, of the Lower House towards the Government was one of challenge, of attack, even of rancor, not of harmonious coöperation and joint endeavor, was from the beginning unmistakable. A note of suspicion and petty fault-finding ran through the speeches made and the bills offered. Perhaps it could scarcely be otherwise after the long years of repression, of exclusion from the secrets of Government, of impotence to realize political aspirations. But it was none the less regrettable. The conduct of the moderate members could not redeem the extravagant and ill-judged action of the majority. But in the end Radicalism undid itself. The session closed with the influence of the Extremists much weakened; and the next session will probably see the Moderates compact and paramount.

But, though the legislative results of the session are of secondary consequence and are of no considerable size, they merit some review. For one thing this first Parliament must be specially credited: it did not attempt to legislate hastily or voluminously. The total number of bills introduced in the Lower House was eighty-one, and not more than fifteen of these

were finally acted upon; while in the Upper House the numbers were even smaller.

At the very first of the session the postponement of the date of operation (January 1, 1891) of the new Commercial Code—adapted from the German Code—was brought up. The state of public opinion on this subject had been a disputed topic, but postponement for two years was voted in the Commons by 189 to 67, and in the Peers by not so large a majority. It was noticeable that the debate dealt very little with facts, that each one's opinion seemed to be already made up. The issue of the matter is, on the whole, satisfactory, for there is need of some further adaptation of the Code to Japanese mercantile usage. But the question is full of difficulties, and is complicated by the desire of the Government to expedite treaty revision by advertising the completion of these imported codes.

Four other important measures, two of which passed and two did not, concerned characteristic conditions of the country. The Registration Bill (passed) revised the system of *koseki*, or personal registration, an historic feature of Japanese social regulation dating back a thousand years. Every family is allotted a page in the district register. When any member of the family marries, moves, goes on a journey, changes his name, or what not, it all receives a mention in the register. Important questions of inheritance, paternity, legitimation, naturalization, and the like are thus involved in the regulation of the register. Without a parallel in our own social system, it is quite in harmony with Japanese habits; but it has too strong an influence in perpetuating the superiority of the official classes. The Weights and Measures Bill (passed) had for its object (1) the fixing of the present standards with scientific exactness; (2) the adjustment of relations of equivalence between domestic and Western standards. The favor accorded in the bill to the metric system brought forth a quantity of patriotic buncombe from some of the Conservative orators which almost equalled our insanity over British designs upon Columbia's commercial prosperity. A rectification and inspection of weights and measures is sadly needed here. One of the debaters, arguing against the bill on the ground of the widespread hardship it would cause, declared that scarcely a set of the existing weights and measures was up to the proper standard—a startling admission, and calculated, one would think, to expedite the passage of the new law.

The Advocates' Bill (not passed) dealt with the qualifications and privileges of lawyers. The Japanese bar is at present in a transition state, and the hundreds of unpractical, superficial young fellows who yearly graduate from the law schools do not help to improve it. In the old days, the suitor crawled on his knees to the judge, and the feed advocate was unknown. This has passed away; but the dignity and the rights of the bar are far from being recognized as we know them. One great merit of this law would have been its recognition of the advocate as an officer of the court. But think of briefless barristers paying license fees of two or three hundred *yen*! Think of a probationary practice of ten years before admission to the bar of the Supreme Court! It was such provisions as these (wise or not as they may be) that killed the bill.

The Poor-Relief Bill (not passed) was an attempt at partially solving one of the coming problems. The subject of charity and relief in old Japan, though little studied by foreign observers, is one of the most interesting. It was a striking example of the "back-to-back" principle put into practice. As in India, each family, each neighborhood, took care of its own poverty and distress. If a man met with distress, his relatives contributed food, his landlord remitted the rent, his neighbors made up a lottery, the *daimio* abated his taxes, until gradually good times came again. But all this is now beginning to change. Local life fades into national life. One sees in the future the family disintegrating and the individual becoming the unit of society. Modern methods must be adopted. The Germans are proposing agricultural insurance as one form of aid. My own opinion is that nothing will avail much until a greater class-amalgamation comes about and a healthy public opinion arises, to inspire and support voluntary organization for economic and charitable purposes.

The Poor-Relief Bill was the Government's. On the side of the people the remedy offered was a land-tax reduction bill, taking ½ per cent. from the 2½ per cent. tax. This tax averages 25 per cent. or 30 per cent. of the gross income, where the land-valuation is correct. But the tax is no more the cause of the agricultural distress than is the farmer's mortgage in our West the cause of his bankruptcy. The true causes lie deeper, among them being the rise in prices and in the standard of living; and investigations are now being made which will lead to surer conclusions. The Lower House passed this bill with scarcely a dissenting vote, but the Peers, receiving it at the close of the session, postponed its consideration. A bill to revise the land-valuations was also shelved for want of time. This was the only measure in which sectional opposition openly showed itself. For various historical reasons, the valuation is too high in some regions, too low in others; accordingly, the petitions for revision numbered 197, the petitions against revision, 85. The next session will see this issue a more prominent one.

Among interesting minor measures comes the appropriation of 500,000 *yen* for Japan's exhibit at the Chicago Exposition. It happened that the draughtsman of the bill had in the preamble spoken courteously of Japan's relations with the United States as closer than those with any other nation. Some cautious members of the Upper House took exception to this language, fearing that offence might be given to other nations. A spirited debate ensued. Apparently no one desired to contradict the statement or to offer any criticism upon our treatment of Japan, and the only ground of objection was the probable offence to other Powers. The words were finally struck out. Other special appropriations, showing a decided liberality to science and a regard for the reputation of the country, were the grants of 10,000 *yen* for the study of Dr. Koch's remedy, and of an extra 100,000 for hastening the official survey of Japan. In the Peers a proposition was made to change the mode of seating the members. The present system ranges the members according to the rank of each one, the rich commoners thus coming last; the proposal was to seat all by lot, the Princes of the Imperial Family excepted. Those who have said in America that Japan is democratic in its spirit will take notice that this change was rejected by a good majority, and that commoners themselves (who form nearly one-half of the body) spoke against it.

The Peace Preservation Regulations of December 25, 1887, will be well remembered in America. These came into prominence again in a peculiar way. They have always been obnoxious, especially to a certain class of politicians strongly represented in the Lower House, and it was well understood that their repeal would be among the first acts of the House. On December 22 the repealing bill was rushed through, the second and third readings being dispensed with, and the measure then went to the Peers for concurrence. But before the latter had time to act, the very *soshi* (political hoodlums) against whom the regulations were specially directed had begun again their deeds of violence. They seem to have been maintained in large numbers by various members, and were employed by them to intimidate political opponents in the House. But, though during the session some six or eight members in all were assaulted, the first person to become a victim to the *soshi* was, by a sort of poetic justice, one of the very members who had been loudest in demanding the repeal of the Regulations, Mr. Suzuki Shoji. The necessity for their continued existence and the premature character of the House's action could not have been better shown. The Government has been strangely lax in punishing these offenders, and the House itself, embracing influential employers of *sashi*, is powerless. Just as our Congressmen and Senators cannot shake off, if they would, the crowd of placemen that have lifted them into office, and must wink at practices against which they dare not protest, so here campaign necessities have surrounded the members with companies of idle and brainless youths. These have followed them from the country, and are now picketed upon them in Tokio, and the intrigues and bargains of Parliamentary life have put it more or less out of the power of the legislators to free themselves.

The Budget, which occupied two months in the Lower House, calls for little mention here. A reduction of 8,000,000 in a total expenditure of 94,000,000, was demanded, and the Government finally yielded nearly six and one-half millions. It is noticeable that the House left the military and naval estimates almost intact. Higher education suffered seriously, for the Female Normal School, the Music School, and several of the colleges have had a portion of their support withdrawn. But Japan has her problems, not dissimilar to our own, as to the length and content of the college course, and the action of Parliament has raised a discussion of the subject which cannot but do good.

People abroad probably did not realize how serious a situation the Budget caused, or how nearly the House came to precipitating a dissolution. The House approved the impossible reductions of the Budget Committee by a vote of 153 to 101; and as the majority held their own firmly on all the Budget votes, the Ministry passed many sleepless nights of indecision over the question of yielding or ordering a dissolution. The extreme Radicals were anxious to force a dissolution and throw themselves upon the country, but the more sensible members of their party were disgusted with the demagogic manœuvres of the Extremists, and seceded in large numbers to the ranks of the Moderates. In the end, Government and House met half way, and a crisis was averted. The Peers had but five days in which to dispose of the Budget; but they showed notable good sense and self-control by refraining from debate and by adopting the compromise Budget sent up from the Lower House. The House of Peers has come out of this first session with an excellent record for ability, sobriety, and legislative skill. J. H. W.

TALLEYRAND'S MEMOIRS.—IV.

PARIS, April 15, 1891.

IT is not impossible to find the philosopher in Talleyrand, as well as the writer, though he

seems to disclaim all literary merit as well as all philosophical pretensions. I read, for instance, at the beginning of his second volume, these lines: "Home life alone can replace all chimæras. But at the epoch of which I speak [1809] this home life, sweet and calm, existed but for very few people. Napoleon did not allow any one to become attached to it; he believed that people belonged to him only when they were homeless." It would be difficult to describe better a state of things, erected by despotism, which had inspired all Frenchmen with a sort of curious indifference and fatalism. Everybody felt that he was led by an all-powerful hand to an unknown destiny. The relations of Talleyrand to Napoleon had become difficult; on various occasions the Emperor publicly made "violent scenes." Talleyrand bore them with his unalterable calm. I have been told (this story is not in the Memoirs) that one day, after one of these scenes, he walked away, quietly saying, "What a pity that so great a man should have received such a bad education!"

In the month of January, 1810, Napoleon summoned an extraordinary council, composed of all the high officers of the State, and explained his intention to divorce the Empress Josephine, and consulted them as to the choice of a new Empress. There were three families from which he might take a wife—the Austrian, the Russian, the Saxon. Talleyrand, when his turn came, explained that an Austrian alliance would be the best for France. "My secret motive," he says, "was that the conservation of Austria depended upon the step which the Emperor was going to take; but it was not a suitable occasion to say so." Talleyrand was all his life a sincere partisan of Austria. He considered this empire as the corner-stone of the European equilibrium; he instinctively hated and distrusted Russia. In the circumstances, he could speak according to his most intimate convictions. The reason he gave was this: the appearance of an Austrian Princess in France would absolve France from the crime of the revolutionary faction and bring about a European reconciliation. He pronounced the word reconciliation several times, thus showing that he thought Napoleon had made wars enough and that peace was now a necessity. A few days afterwards, the Emperor asked for the hand of the Archduchess Marie Louise, and his offer was accepted. Berthier, Prince of Wagram, was sent to Vienna to marry the Archduchess by proxy, and the Emperor chose, as the lady-in-waiting of the new Empress, the widow of Marshal Lannes, the Duchess of Montebello. At the very moment when the guns of the Invalides announced the marriage to Paris, other guns were blowing up the fortifications of Vienna, according to the conditions of the last treaty imposed by Napoleon. It was by this means that Napoleon wished to associate his new union with the glory of his army. He treated his father-in-law with the greatest severity; peace was for him only a respite.

Talleyrand was well aware that Napoleon was fatiguing Europe. The Emperor had one day been so imprudent as to say that before he died his dynasty would be the oldest in Europe. He distributed to his brothers and to the husbands of his sisters the thrones which conquest or perfidy placed in his hands. Naples, Westphalia, Holland, Spain, Lucca, Sweden had become dependencies of his Empire. Talleyrand analyzes with much truth the feelings of these new sovereigns "par la grâce de Napoléon." He prophesied that they would soon escape from his tyranny as rapidly as Philip V. of Spain had escaped from the tyranny of Louis XIV. Each of these new creations was really a source of weakness for Napoleon. "Napoleon took pleasure in disquieting, humiliating, tormenting those whom he had elevated; and they, placed in a perpetual state of uneasiness and irritation, worked underhandedly against the power which had created them, and which they already considered as their principal enemy."

Talleyrand even finds fault with the special style of luxury of the new courts. "The luxury of these Napoleonic courts, we may here remark, was absurd. It was neither German nor French; it was a mixture, a sort of erudite, eclectic luxury. It had something of the Austrian gravity, something Asiatic, taken from St. Petersburg. It paraded mantles taken from the Rome of the Cæsars; but it showed very little of the old French Court, where luxury so happily concealed magnificence beneath the charms of all the arts and of taste." Talleyrand thinks that the Bonaparte family, issued from a half-barbarous island, would have seemed greater if it had adopted simple republican ways. Surely, the people remember the Emperor, not as David paints him in his famous pictures of the coronation or of the marriage, robed like a Cæsar, but as the soldier with the gray redingote, the "petit chapeau."

"I wish," says Talleyrand, "to avoid what might seem libellous, and I need not mention names in order to prove that, by their private manners, these new dynasties diminished the moral power of the Emperor Napoleon. The manners of the people, in troubled times, are often bad, but even when the populace has all sorts of vices, its morality is severe. 'Men,' says Montesquieu, 'corrupt in detail, are very honest *en gros*.' And the people who are honest in this way judge kings and queens. When their judgment is a condemnation, it is difficult for a Power, especially of recent date, not to be shaken by it."

Talleyrand is particularly severe on the attempt of Napoleon to place his brother on the throne of Spain; he sees in the Spanish war almost a sign of madness. He condemns also Napoleon's conduct towards the Pope; he enters into very minute details on the great question of the relations of France with the Papacy; but these details are not very new, and have now lost much of their interest. You will find the Bishop of Autun and the theologian in this long chapter. Talleyrand, though he was secularized, could never quite forget his clerical origin.

We come now to the eventful years which preceded the fall of the Empire and the Restoration of the Bourbons. Some passages show clearly that this part of the Memoirs was written during the Restoration and before the death of Louis XVIII. "Let him," says Talleyrand, "remember a moment all that was necessary after 1803 to pave the way for his return." The mistakes and illusions of Napoleon were one of those necessities. Talleyrand thinks that Napoleon could have remained on the throne and founded a dynasty under these conditions: "It was necessary (1) to effect the unity of Italy by transferring to her the House of Bavaria; (2) to divide Germany between the House of Austria, which would have extended itself to the mouths of the Danube, and the House of Brandenburg, which would have been enlarged; (3) to resuscitate Poland and give her to the House of Saxony." You will recognize here the great foresight of Talleyrand as well as his fear of the Russian domination in Europe. He distinctly foresaw the necessity of Italian unity, of the aggrandizement of Prussia, of a barrier against Russian ambition. "Napoleon might have done these things, and he did not do them. If he had, gratitude would have built statues to him, and his death would have been mourned by all nations." Talleyrand says that he felt a bitter grief on seeing the Emperor ruin himself. "I loved Napoleon; I was attached to his person, notwithstanding his defects. At the beginning I felt drawn towards him by the irresistible attraction of genius." He always told him the truth, but the truth had become unpalatable to the despot. He had become an object of the fears of Napoleon, and he was shadowed by Savary's police. Nevertheless, Napoleon offered him the Foreign Office in December, 1813, but Talleyrand refused it. Napoleon once said afterwards to M. de la Besnardière, when he found himself entangled in great difficulties: "Ah! if Talleyrand were here, he would draw me out of this." "He was mistaken, for I could only have done so, which I probably should have done, by accepting the conditions of the enemy; and on the same day, if he had had the slightest military success, he would have disavowed my signature." This was said during the negotiations of Châtillon, when the Allies were already in France.

When Wellington crossed the Bidassoa and entered the south of France, the Duc d'Angoulême made his appearance at Saint Jean de Luz. He excited some curiosity and was well received, but the English general did not let him ignore the fact that his Government was treating with Napoleon, and that he could do nothing for the Bourbons. The Memoirs of Talleyrand are in perfect accordance with those of Vitrolles, who boldly joined the headquarters of the Allies, and made himself the advocate of the Restoration of the Bourbons. Vitrolles had a mission from Talleyrand, and his instructions were these: "On the probable supposition of the definitive defeat of Napoleon, what would the Allies do? Would they treat with the Emperor, or would they allow France to choose freely another form of government?" Talleyrand, though he could not expect much sympathy from the Bourbons, had made up his mind that their return was the best solution for France, that it would insure peace, and that it would secure for France the best frontiers she could hope to preserve.

M. de Vitrolles fulfilled his mission with much zeal and intelligence; he saw Stadion, Metternich, the Emperor Alexander. When Alexander entered Paris, he went directly to the Hôtel St. Florentin, which was the residence of Talleyrand. In the first conversation which took place between them, the question of the government of France was immediately discussed. "How can I know," said the Emperor, "that France desires the House of Bourbon?" "By a resolution, Sire, which I will ask the Senate to pass, and of which your Majesty will immediately see the effect." "Are you sure?" "Quite sure." On the 2d of August the Senate was convoked, and in the evening, at seven o'clock, Talleyrand brought to the Emperor Alexander the memorable and unanimous address which pronounced the downfall of Napoleon and the reëstablishment of the Bourbons with constitutional guarantees. "The Emperor Alexander was stupefied, I must confess, when he saw amidst the names of the Senators who asked for the House of Bourbon the names of several men who had voted for the death of Louis XVI."

Talleyrand had invoked, in his conversation with Alexander, as he did afterwards with success at the Congress of Vienna, the principle which he baptized with the name of *légitimité*, and which has ever since preserved that name; he said to him:

"Neither you, Sire, nor the allied Powers; neither myself, to whom you attribute some influence—none of us, in short, can give a King to France. France is conquered, and by your arms; nevertheless you have not that power. An *imposed* King would be the result of an intrigue or of force; they are both insufficient. To do something durable and which can be accepted without a protest, you must act from a principle, . . . and there is but one in this case: Louis XVIII. is a principle, he is the legitimate King of France."

A provisory government had been named. Talleyrand was the President of it; the other members were the Duc de Dalberg, Count Jaucourt, the Abbé de Montesquiou, and Gen. Beurnonville.

Correspondence.

MR. HAMERTON ON "ETCHING."

To the Editor of The Nation:

Sir: One of your contributors blames me for having said that photogravure was etching. I have said it of a certain kind of *héliogravure*. "*Photogravure*," when the word is employed in its special sense for the Goupil process, is not etching at all; *héliogravure*, when tones are imitated without lines, is in fact a kind of aquatint, and is correctly called so by Messrs. Boussod & Valadon in their announcements. *Héliogravure* by Dujardin from pen-drawings is technically a kind of etching, but of course it would be misleading to call it "etching," without explanation, when addressing the general public. When Amand Durand used to copy the etchings of Rembrandt, Claude, Vandyke, and others, he employed photography only for the transfer of the drawing to a sensitized etching-ground. His process of biting was exactly that of an ordinary etcher. The difficulty was enhanced by the delicacy of the first sensitized ground, which he removed as soon as rebitings became possible, when he covered the plate again with an ordinary etching-ground and proceeded just as etchers do. The result is therefore *etching by division of labor*, the work being shared by an artist, a photographer, and a chemical operator for the biting. I am now told in various periodicals that to be an "etching" a plate must be drawn on the copper by the artist, and be bitten by himself. I have no objection, but can only remark that if this is to be so, the learned in art matters will have to give up calling Turner's plates "etchings," as, although the designs were drawn on the copper by him, it seems very probable, if not certain, that the biting was done for him by a professional engraver; and if not etchings, what are they?

The origin of my expression of opinion on the matter which has excited so much protest is briefly this: Mr. Pennell, in his book on 'Pen-Drawing,' tried to depreciate etching in comparison with his own art, referring to works as pen-drawings which had been so no doubt in their origin, *but which had been since transmuted into etchings by being bitten into copperplates, thereby borrowing the depth and power of the etched line*, which the real pen-line with ink on white paper cannot, in its flatness, possess. What I said was in substance this: "A fair comparison of pen-work with etching would be between pen-lines and bitten lines, not between bitten lines and bitten lines." A little anecdote about Sir John Gilbert may make this clearer still. Sir John had done a pen-drawing for the *Portfolio*, when I sent it to Amand Durand, who reproduced it as an etching. This did not please Sir John, who wanted the quality and the values of his ink lines. Amand Durand, on learning this, wrote to me and said: "I thought you wanted the pen-drawing *to be turned into an etching;* that is why I bit it in that manner, but in another reproduction I will imitate the quality of the ink lines," and he did so. In my opinion, all processes for the reproduction of pen-drawings in which the lines come as an intaglio etching or engraving, are inferior in fidelity to mechanical autotype.

One word more as to the matter of honesty. Those who blame me for imprudently revealing what is simply the truth about linear *héliogravure*, may be invited to discover a single instance (in the *Portfolio* or elsewhere) in which I have authorized by my example the practice of passing off reproductions as original work. I may add that a professional engraver of the greatest eminence once offered to bite my own plates for me to economize my time; but I thought that an artist ought to do all the work himself, even though, like some of the old masters, he was sometimes unskilful or unlucky in the chemical operations. However, a division of labor (and all this is nothing more) might be tolerated if it were always duly acknowledged.—Sincerely yours,

P. G. Hamerton.

Autun, April 15, 1891.

THE MODEL BALLOT LAW.

To the Editor of The Nation:

Sir: In the *Nation* of the 16th of April, praising the new ballot law of New Hampshire, you call attention to what you style "a new feature" in such laws, requiring ballot-boxes with "a bell and mechanical device, for receiving, registering, and cancelling every ballot deposited therein." You say of this feature: "There is no obvious reason for the adoption of boxes of this kind, except that the owners of some patented device succeeded in inducing the Legislature to make use of it."

Will you kindly give me a chance to do an act of justice to the New Hampshire Legislature, and at the same time to explain, what is not generally understood, that the registering and cancelling ballot-box is an important part of the Massachusetts ballot system? These boxes were adopted and used in Massachusetts in 1884 (Acts 1884, chap. 299), and then and ever since have given the utmost satisfaction. The Australian-ballot law of Massachusetts was drawn with reference to these ballot-boxes. Without the existing use of these boxes, the Massachusetts ballot law would be defective. In England the ballots are numbered, and while this serves many other purposes, it also serves, in case of an election contest, to disclose how a voter has voted, and just so far impairs the secrecy of the system. The ballot-box used in this State cancels the back of the ballot as it is received, in red ink, with waving lines, and with the number of the ward and precinct, but in a uniform way so that the voter cannot be identified by his ballot. If by any chance two ballots are cast at once, only one of these is cancelled, and therefore the "stuffed" ballot is immediately detected. At the same time that the ballot is received a bell rings and one higher number is indicated on the register. At the close of the voting the number on the register is written down and certified to, the box is emptied of its ballots, relocked, and taken back to the City Hall, and this has to be done before the counting of the ballots begins. If during the counting, or at any time afterwards, any one in charge of the ballots tries to substitute any ballots for those actually cast, the fraud is easily detected, as the new ballots will not be cancelled. Without describing the details in full, I have said enough to show that we thus insure that the ballots counted are the ballots cast, which is a very important, but, unfortunately, a rare thing in this country. It is this provision which makes our recounts in Massachusetts of some real value.

The Massachusetts bill has been copied by some States without the knowledge, apparently, that we had a ballot-box law, and without making any provisions for otherwise accomplishing what our ballot-boxes do. Mr. George F. Page of Concord, N. H., Chairman of the Special Committee on Ballot Law of the New Hampshire Legislature, came to Massachusetts, and made a thorough study of our system. He consulted with the officers of the Ballot-Act League, with the Secretary of the Commonwealth, and some of our leading city clerks. He was persuaded that the registering and cancelling ballot-box was a very valuable feature of our Massachusetts law, and the New Hampshire bill, as reported and now enacted, by containing that and certain other features of the Massachusetts system not specified in the Massachusetts act of 1888, and by containing also a few changes recommended by friends of the Australian system of Massachusetts, seems to many of us to be the best model for States wishing to have all the election-law advantages we possess in Massachusetts.—Yours truly,

Richard H. Dana.

THE LANGUAGE TEST FOR IMMIGRANTS.

To the Editor of The Nation:

Sir: The article in the *Nation* for April 16, entitled the "The Proper Sieve for Immigrants," proposing a language test for those who would become inhabitants of this country, calls to mind a series of very interesting investigations which were made by the writer, a few years ago, in an attempt to find out precisely from what nationalities the dangers resulting from alien ideas and training were most to be feared. The inquiry was made in the State of Minnesota, which by reason of the large percentage, as well as the diversity, of its foreign population, presented an unusually good opportunity for this kind of research. The result showed that in all the public institutions of the State, including both penal and charitable institutions, the percentage of inmates was very much smaller, in the case of every foreign nationality, according to their ratio of the whole population, than for the natives themselves—except the only two English-speaking peoples that come to our shores. These, *i. e.*, the Irish and the English (including Scotch), alone exceeded their quota; the former furnishing more than three times their proper quota according to the population. And yet these would have been those who could most easily have passed the test which your editorial proposes. It can be shown, not only from these, but from many other sources, that the dangers to which our national and social life is exposed, come to us much more from English-speaking than from any other peoples.

Sincerely yours, A. A. Berle.

Cambridge, Mass., April 22, 1891.

To the Editor of The Nation:

Sir: Your plan of making a knowledge of English a requisite for admission to our country would be an injustice to a large class of desirable immigrants. Nearly all Swedes and Norwegians cannot speak it when they first

come, but learn it in a surprisingly short time. The same is true to a less extent with the Germans. These people, at least in the West, quickly assimilate American ideas, and become our steadiest and most useful citizens.

E. C. SPENCER.

ST. PAUL, April 21, 1891.

THE THEATRE AT MEGALOPOLIS.

TO THE EDITOR OF THE NATION:

SIR: The excavations at Megalopolis, begun by the British School at Athens in 1890, have aroused great interest among scholars. These excavations disclose a well-preserved Greek theatre. Mr. Ernest Gardner announced with confidence in the London *Athenæum* for August 2, 1890, that he and his colleagues had here discovered a Greek stage dating from the fourth century B. C. An official report on this theatre, accompanied by two plans, and signed by Mr. Gardner, Mr. W. Loring, and others, is made in the *Journal of Hellenic Studies* for October, 1890. According to this report, the Greek stage was 5′ 10″ high and 18′ 2″ broad. It was mounted by means of a flight of six steps, three of which remain, that ran along its entire front and sides. In the wall at the rear of the stage are three doorways which led into a stoa that lay behind. This Greek stage, according to the ground-plan given, was about 105 feet long. About 20 feet in front of it is a low wall which supported the columned front of a *Roman* stage. Five of the columns, or parts of them, are still in position.

In the *Berliner Philologische Wochenschrift* for April 4, 1890, Dr. Dörpfeld, the distinguished First Secretary of the German Archæological Institute at Athens, denies the soundness of these conclusions of the English archæologists. Half-a-dozen years ago Dr. Dörpfeld advanced, mainly on the ground of architectural considerations, the view that no stage existed in the Greek theatre, but that in the time of the great dramatists the actors and the chorus stood on the common level of the orchestra. What Vitruvius mistook for the front wall of a stage ten or twelve feet high (technically called the *proscenium*) was not that at all, but the wall on which the scenery was suspended. The actors stood in front of this, not on it. In the early times it was a temporary structure of wood; later, in Roman times, it was built of stone. This view, I may add, is strongly supported by the literary evidence furnished by the extant dramas, especially by the comedies of Aristophanes. The report in the *Journal of Hellenic Studies* says that the discoveries at Megalopolis are fatal to Dr. Dörpfeld's view. "For our stage is proved to be 'Greek' at once by its structure, by its position, and by the existence of a separate Roman stage." The *Classical Review* for March, 1891, in an equally confident tone, states that the excavations at Megalopolis have conclusively proved the existence of a Greek stage, in addition to the Roman stage, "and therefore Dr. Dörpfeld's theory will not hold."

Dr. Dörpfeld, whose modesty and fairness are surpassed only by his skill in dealing with difficult architectural problems, believes and acts on the belief that anybody who digs a hole in Greek lands has the first right to tell what he finds in it. He has waited, therefore, until the present time before announcing his own view of what actually has been unearthed at Megalopolis. Briefly stated, this is as follows: First, what the English archæologists suppose to have been a Greek "stage" was the main theatre-building, entered by a flight of *three* steps. Its front wall was thirty metres distant from the middle seat of the front row of seats in the auditorium. This is about the position of the corresponding wall (*scænæ frons*) in the great theatre at Athens. The three doors in the *rear* wall of the theatre-building led to the stoa behind. Their sills lie 5′ 10″ above the orchestra, because the level of the stoa was to just that extent higher than the level of the orchestra. Secondly, what the English archæologists suppose to have been a Roman stage (but with some misgivings, since "it does not conform in every respect to the Roman *type*") was the *proscenium*. It is precisely of the type of those found at Athens, Piræus, Oropus, Thespiæ, Epidaurus, and Assos. Five of the columns, or parts of them, are yet *in situ*. This stone structure dates from the Roman times. It took the place, as in other theatres, of an earlier temporary wooden structure. The actors stood in front of this on the floor of the orchestra. Dr. Dörpfeld regards the ruins of the theatre at Megalopolis as the best evidence yet produced by excavation of the truth of his theory.

Three considerations may be added. First, the dimensions of the ruins at Megalopolis which the English archæologists suppose to have been a stage, but Dr. Dörpfeld the theatre-building, agree closely in respect to length and breadth with what it is agreed was the main theatre-building at Epidaurus. Secondly, the English archæologists have made no provision whatever in their disposition of the ruins for such a theatre-building, where the machinery would be stored and the actors would dress and change their masks—a grave omission. Finally, in explanation of the three (not six) steps, traces of which have not been found elsewhere, we may reasonably suppose that the top of this flight of steps marked *the level of the floor of the main building*. Three additional steps resting on this floor at the rear of the building would be necessary for attaining through the doors in the rear wall the level of the stoa which lay behind. The steps, then, are accounted for by the peculiar situation of the main building between two levels.

JOHN WILLIAMS WHITE.

CAMBRIDGE, MASS., April 18, 1891.

Notes.

MACMILLAN & Co. will publish directly a 'Short History of Greek Philosophy,' for students and general readers, by Dr. John Marshall, rector of the Royal High School, Edinburgh, and 'Khaled, an Eastern Tale,' by F. Marion Crawford.

D. Appleton & Co. announce for early publication 'We All,' by Octave Thanet, with many illustrations, a new book in the series of "Good Books for Young Readers"; 'Tourmalin's Time Cheques,' a new story by F. Anstey; 'The Maid of Honor,' by the Hon. Lewis Wingfield; 'From Sunshine to Shadow,' a novel by the Marquis of Lorne; 'Consequences,' a novel, by Egerton Castle; Baldwin's 'Applied Psychology and Art of Teaching'; Herbart's 'Psychology'; 'A Descriptive Guide-Book to Canada,' including full accounts of the opportunities for sportsmen and tourists, by Charles G. D. Roberts; and 'North America,' volume xv. of Reclus's "The Earth and Its Inhabitants."

W. H. Lowdermilk & Co., Washington, have in press 'Scatalogic Rites of all Nations,' by Capt. John G. Bourke, Third Cavalry, U. S. A.

A. C. McClurg & Co., Chicago, announce a two-volume novel, 'Monk and Knight,' by the Rev. F. W. Gunsaulus.

The Dunlap Society expects to issue this year a supplementary volume of Mr. William Winter's 'Brief Chronicles,' which will include an essay on the late Lawrence Barrett. Mr. William L. Keese is also preparing for the Society a memoir of the 'Private Life of William E. Burton,' to contain many interesting letters. Both of these, and a third volume not yet announced, will be illustrated. Mr. William Carey has succeeded Mr. Brander Matthews as Secretary, and his address is No. 33 East Seventeenth Street, New York.

Aristotle's newly discovered work on the 'Constitution of Athens' has been translated into German by Georg Kaibel and Adolf Kiessling, professors in the University of Strassburg, and is to be published by K. J. Trübner of that city.

A most useful and compendious work, the 'History of England from the Conclusion of the Great War in 1815 [to 1861],' by Spencer Walpole, which originally appeared in three volumes in 1879, has now been reproduced in six, well-printed and neatly bound, and offered at a moderate price (Longmans). The author has revised it, and to some extent rearranged or recast it, so that this popular edition is also the most desirable for the student. There is an index of more than eighty pages.

We made mention the other day of a new edition of Darwin's 'Coral Reefs.' D. Appleton & Co. have just published a new (third and authorized) edition of the same naturalist's 'Geological Observations on the Volcanic Islands and Parts of South America Visited during the Voyage of H. M. S. *Beagle*.' The original merit of this work has been but little affected by time, while the general reader is to-day undoubtedly better fitted to understand and enjoy the 'Observations' than when they were first given to the public. No one engaged in teaching physical geography should be without a knowledge of this characteristic product of Darwin's mind.

The Government is doing a good thing in issuing works that have their particular value for specialists and at the same time are adapted to the needs of students in general. The Geology of Cape Ann, by Prof. N. S. Shaler, is one of several that make excellent handbooks for local studies. The region traversed is popular as a seaside resort, and its study offers double attraction to individuals or classes in opportunities for combining pleasure and research during a vacation. The book, with its numerous beautiful illustrations of the scenic and other geological features, and its maps and charts, forms a splendid guide as well as text-book. The Professor gives liberal credit to his assistant, Mr. Ralph S. Tarr. A novel feature is introduced in the structure of the diagrammatic tabulations of dips of dikes, strikes of dikes, joint planes, and of the distribution of joint planes. The paper is issued as an extra from pages 529 to 611 of the ninth Annual Report of the Director of the United States Geological Survey.

Landor's 'Citation and Examination of William Shakspeare,' as it was one of the most daring, was also in some respects one of the happiest, of his conversations in imagination, though we confess to finding it prolix even for a volume of leisure. It must be acknowledged, also, that one cannot believe for a moment in his youthful Shakspere; but the other characters are sufficiently drawn, and serve as mouthpiece and target for the rambling Elizabethan talk which is often at Landor's best. The reissue of the work by Dodd, Mead & Co., with a few unnecessary words of introduction by Hamilton Wright Mabie, is very prettily illustrated and bound, and makes a handy edition of this curious classic. It should perhaps be

added that the conversation between Spenser and Essex, after the former's misfortune in Ireland, which is represented as coming from the same papers as the 'Citation,' concludes the volume.

M. Henri Bouchot has followed his little treatise on bookplates by another on 'Les Livres Modernes qu'il convient d'acquérir' (Paris: Rouveyre; New York: F. W. Christern). It is a careful consideration by an expert of the best editions, and more particularly of the most elaborately illustrated *éditions de luxe*, which have been published in Paris within the past twenty and thirty years. M. Bouchot being an expert in the exact sense of the word—he is officially connected with the National Library—and having a fine taste of his own, is not easy to please, and some of the most sumptuous productions of Parisian publishers of late years fail to find favor in his eyes. But he is not arbitrary, and he gives excellent reasons for his likes and dislikes. His booklet, therefore, is one which can be read to advantage by both booklovers and bookmakers in this country. It is amusing to witness his horror of the extra-illustrated book, grangerized by the insertion of heterogeneous plates of all sizes.

D. C. Heath & Co. have added to their Modern Language Series the charming Corsican tale of Prosper Mérimée's, 'Colomba,' annotated by Prof. J. A. Fontaine of the University of Mississippi.

Mrs. C. Goodyear's 'Message to China Decorators' (Society of Decorative Work, New York), and M. F. Hayes's 'Common Sense in China Painting' (Westfield, N. Y.), show outwardly the contrast of their respective contents. Mrs. Goodyear dwells on the design, on the art, while her sister author describes with great minuteness the technical process, leaving the fewest possible questions to be asked by the beginner without a teacher, but having no advice to give about training and proficiency in draughtsmanship. On this point Mrs. Goodyear's doctrine is sound, as such technical instruction as she vouchsafes is profitable to observe; but her message might better have been conveyed in the simple book form of 'China Painting,' instead of being printed as an awkward roll, however elegantly got up. Both manuals may well be procured by the tyro.

The Society for Political Education has published, through G. P. Putnam's Sons, a very useful 'Reader's Guide in Economic, Social, and Political Science.' It contains a classified bibliography, American, English, French, and German, with proposed courses of reading, and with the courses in this department at the principal colleges. Brief descriptive rather than critical notes are added under some of the titles. It contains 170 pages.

The pamphlet Bulletin issued at Albany from the State Library, entitled "Legislation No. 1, February, 1891," is the beginning of an enterprise of singular political utility. What is attempted by Librarians Dewey and Shaw is a "comparative summary and index of State legislation in 1890"—and regularly hereafter if their labor meets with approval. Under twenty-four heads one is directed to the statutes of seventeen States and one Territory regarding public morals, religion, finance, military, insurance, agriculture, public health and safety, etc.; while an index gives the key to particulars, such as Australian ballot, women, ten-hour day, sleeping-cars, minors, Paris green, overhead wires, fire companies, bounties, etc., etc. It is superfluous to expatiate on the advantage of such a conspectus of the annual legislative movement, so to speak. It is a distinct contribution to sane law-making, and to the unification of the several States by promoting the adoption of improved ideas and principles. The compilers deserve the gratitude of all, and their Bulletin should be supplied freely to the members of every Legislature in the country. Students of comparative legislation cannot afford to dispense with it.

A fine publication is begun, under the auspices of the Hemenway Southwestern Archæological Expedition and the editorship of Dr. J. Walter Fewkes, viz., a *Journal of American Ethnology and Archæology* (vol. i., Boston: Houghton, Mifflin & Co.). The editor contributes two papers, both illustrated, on "A Few Summer Ceremonials at Zuñi Pueblo," and "Reconnoissance of Ruins in or near the Zuñi Reservation," while Mr. Benjamin Ives Gilman discourses on "Zuñi Melodies," of which he furnishes nine examples in musical notation. The novelty here consists in the fact that Mr. Gilman took down these melodies from Dr. Fewkes's phonographic cylinders. The defects of this invaluable record of the human voice are pointed out by Mr. Gilman, who can still say: "A collection of phonographic cylinders like that obtained by Dr. Fewkes forms a permanent museum of primitive music of which the specimens are comparable, in fidelity of reproduction and convenience for study, to casts or photographs of sculpture or painting." And Dr. Fewkes himself says: "I was able, for the first time, I believe, to illustrate lantern views of a sacred dance with an audible reproduction by the phonograph of the song which was sung when the ceremony was taking place." The whole volume is replete with interest.

The April Proceedings of the Royal Geographical Society opens with Mr. E. G. Ravenstein's paper on the recent expedition of the British East African Company to Uganda. It accomplished little from a political or geographical point of view, but, on the side of natural history, Mr. Bowdler Sharpe of the British Museum, referring to the collection of birds made by it, says that an examination of them shows "that we must entirely revise all our ideas as to the zoo-geographical regions of Africa." In the discussion of the paper by the Society, Sir T. F. Buxton commented very severely on the treatment of the natives by Count Teleki and Dr. Carl Peters. Of the latter he says: "Of course, it is hard to fathom anybody's motives, but inasmuch as Dr. Peters travelled deliberately through a territory at the time acknowledged to be within the British sphere, and apparently did all he could to excite hostility against any other white traveller, it opens the question whether such an inevitable result was accidental." Next follows an account of a Russian expedition for the exploration of the Tian Shan oases of Central Asia. It claims to have discovered a mountain group, approximating 20,000 feet in height, hitherto unvisited and even unseen by any modern traveller.

The most valuable feature of the *Scottish Geographical Magazine* for April is a map of Africa so colored as to show the comparative values to the civilized world of African lands, by the editor, Mr. A. Silva White. Three sets of colors are used: four gradations of blue to designate areas of highest resistance against European influence; five of reddish-brown to show the areas of highest value; and two of yellow to show the intermediate or transitional areas. The main factors for determining these values were climate, natural communications, resources, foreign trade and political conditions. The other articles are by the Rev. James Stewart on Southern Africa, in which he warmly advocates confederation; and an account of recent explorations in British East Africa. In the geographical notes attention is called to the fact that in Kamtchatka there are now twenty-one active volcanoes, while in 1850 only twelve were known to exist.

Lord Randolph Churchill is about to visit Mashonaland for the purpose of seeing for himself whether it is fitted for British emigration on a large scale. His letters are to be published in the London *Daily Graphic*, with illustrations by Capt. Giles, R.A., the commander of the expedition.

The report of Col. Paiva de Andrada to the Portuguese Ministry in regard to his arrest by an officer of the British South Africa Company has been translated and published under the title 'Manica' (London: G. Philip & Son), accompanied by a map of the region in dispute. This is a small plateau, about thirty miles square, situated one hundred and fifty miles south of the Zambesi, and about the same distance from the Indian Ocean. Its value consists in the gold reefs which have been discovered within the past two years. One district, the report says, "has been declared by all prospectors to be unrivalled in the abundance and quality of its auriferous deposits; neither California, nor Australia, nor any other quarter of the world presenting anything like it." The mining rights are claimed by the Mozambique Company in virtue of a concession by the Portuguese Government. As a representative of this company, Col. de Andrada was endeavoring to obtain a confirmation from the King of Manica of the original verbal treaty by which the sovereignty of Portugal was acknowledged some twenty years before, when he was arrested and carried to Cape Town. This action was taken on the ground that the King, Umtasa, had concluded a treaty with the British Company in September, 1890, and had desired protection from the Portuguese. The report does not deny this, but claims that the King had no right to make such a treaty, being a Portuguese subject; that he was intoxicated when he made it, and that no armed force was used or was present to be used. In essential particulars Col. de Andrada's account of the transactions does not differ from that of the *Times* correspondent. It should be added that in the provisional agreement of August 20, 1890, between Great Britain and Portugal, which was rejected by the Cortes, this plateau was distinctly given to the latter country.

We deeply regret to record the death on Friday last of Mr. F. W. Christern, one of the oldest foreign booksellers in this city, and one of the most genial and most respected. For a few years he resided in Philadelphia, but for more than thirty his bookstore, with several removals, has been a familiar resort for all New Yorkers who take an interest in Continental literature. Mr. Christern's obligingness was inexhaustible, and the *Nation* has been indebted to him for unfailing good will and many favors.

—With reference to *esprit d'escalier*, "H. H. F." writes to us:

"It may not greatly help your correspondent, but I can inform him where I met the phrase in question over forty years ago. It is in 'The Tour of a German Prince,' that pleasant, gossipy, attractive book by a man of highly unsavory posthumous reputation. I think, for I have not seen the book since that distant first reading, that the writer, Prince Fückler-Muskau, either mentions the author of this phrase or claims the authorship for himself. At any rate, I remember merely that the phrase is there, and that its definition is almost exactly that which you cite from the 'Konversations-Lexicon.'"

—The May *Harper's* offers an unusual number of attractive articles by which the ordinary reader may be agreeably instructed, but the most remarkable is Archdeacon Farrar's paper upon the Salvation Army. He undertakes, he says, neither to defend nor to condemn, but to state what this remarkable revival has counted for in the life of the unreligious masses in England; but he is plainly convinced that the facts themselves are large enough to make either defence or condemnation futile. The important and striking position taken by the Archdeacon is the frank admission that the Christianity of the English Church is a thing unintelligible to the poorer classes, its ritual and services powerless to attract them, and the whole institution utterly removed from their needs and lives. It would appear from his statement of the case that Christianity, as it is embodied in the English Church, is as foreign to these people as Buddhism. It simply has no contact with them. Opposite to this failure on the one side he sets the work of regeneration actually accomplished by Gen. Booth and his associates and disciples in rousing a religious emotion and active faith in these same masses. Vulgar in expression and military in its organization, though it be, the Salvation Army has, he quotes Bishop Lightfoot as saying, "recalled to us a lost secret of Christianity," and he intimates at least that the music, the banners, and the shouting are merely another kind of ritual, pleasing to persons whose æsthetic taste is not developed to the point of appreciating a more refined, venerable, and ancient processionalism. In a word, the results are so great that the methods are lost in them, and the exhibition is one well calculated to set English churchmen to thinking about the old methods. Of the remaining papers we can direct attention only to Bishop Walden's estimate of Argentine institutions, which is far more favorable than Theodore Child's late article, and to Mr. Conway's researches upon the subject of Washington's English ancestry; and we barely mention the interesting attempt of Mr. Lawrence to rebuild Roman London in fancy, and to describe its merchant life, and the very delightful Warwickshire views with which the number opens.

—It is not impossible that the new *International Journal of Ethics* (the third number of which lies before us) will mark a new stage in the gradual task of elevating the world's standards of ethical conduct. There is so much ferment at present in men's minds in regard to various questions upon which ethics have a bearing; there is such widespread dissatisfaction with the perpetuation by religion of outgrown ethical codes and the quieting of conscience by stifling rational thought; there is such a quickening of the feeling of our inability to endure the sufferings of the lowest classes (the reading of Edward Bellamy's book, Prof. Gizycki says, has made an epoch in the lives of many thousands)—that a medium for the application of scientific methods of thinking to pressing questions of belief and practice cannot fail to be of great importance. The present number of the *Journal* shows a marked advance, in the importance of its contributions, over the other two. It would be hard to bring together four articles of greater weight than the four with which it opens. Leslie Stephen upholds the English school of political economy and opposes socialism and absolute equality, in the interest of what may be formulated as *no inequality without sufficient reason*, as the ideal of a future rational Utopia. Prof. Toy discusses "The Religious Element in Ethical Codes," and reaches the conclusion that it has been, on the whole, of somewhat equal good and evil influence. Prof. William James writes, with the brilliancy and the moving quality to which the readers of his 'Psychology' are accustomed, on "The Moral Philosopher and the Moral Life." Prof. Gizycki's article, "The Right Final Aim of Life," shows a less substantial logical structure, but it starts discussion upon a subject to which there will doubtless be frequent occasion for returning. Miss Collet reminds her readers of the value of the old-fashioned moral tale in awakening the moral life in children, and says, what every parent will notice who tries the experiment, that children are intensely interested in discussions of conduct, and that it is only insincerity and namby-pambyism that they reject with unerring scorn.

—Dr. Otto Braun, who, for nearly thirty years, has been editor-in-chief of the Munich (formerly Augsburg) *Allgemeine Zeitung*, resigned this position on April 1. His retirement was due, not to any change in the political character of the paper or in the general principles on which it has been hitherto conducted, but solely to the fact that advancing age, attended by an affection of the eyes, rendered it increasingly difficult for him to discharge the arduous duties of his office. As a native of the rigidly conservative and feudalistic Hesse-Cassel, a young man of intelligence and independent spirit like Braun could hardly help beginning his political career as a Revolutionist. He was an associate and intimate friend of Carl Schurz, and, like him, was obliged to flee his country after the suppression of the revolutionary movement of 1848. He spent some time in Paris and then went to Spain, where he devoted himself to the study of Spanish literature, in which he is a recognized authority. The excellence of his numerous translations of Spanish poetry is universally conceded by his countrymen. On completing the twenty-fifth year of his editorship of the *Allgemeine Zeitung*, he received the honorary degree of doctor of philosophy from the University of Munich in recognition of his services to literature and science as a high-toned journalist. On the occasion of his retirement, a magnificent album, containing the photographs of the principal contributors to the paper, was presented to him. This collection includes the majority of the most distinguished scientists and men of letters in Germany, each of whom has written an original sentiment or poem on the back of his photograph. Dr. Braun is a person of fine taste and eminent discretion; he is an acute observer and has had an unusually wide experience, and his memoirs, if he would devote his leisure to the task of writing them, would be a valuable contribution to the history of the last half century. His editorial successors are Hugo Jacobi as editor-in-chief and Dr. Alfred Dove, a pupil of Ranke and professor in the University of Bonn, as editor of the *Beilage*.

—We may add that the place which the *Allgemeine Zeitung* holds among daily newspapers is quite unique. It was founded nearly a century ago by Baron von Cotta, by the advice of Schiller, who intended to edit it, but was prevented from doing so by ill-health. Although planned as early as 1793, circumstances did not favor its immediate publication. The first number was issued at Tübingen in 1798, under the editorship of the historian E. L. Posselt. In the same year it was transferred to Stuttgart, thence in 1803 to Ulm, and in 1816 to Augsburg, and finally, about ten years ago, to Munich. A peculiar feature of the journal is the *Beilage*, or literary supplement, which appears with the evening edition every day except Sundays, and contains elaborate articles on artistic, belletristic, philosophical, and scientific subjects, and thorough reviews of books, such as are commonly found only in weekly or monthly periodicals. It was in this *Beilage* that Döllinger assailed the decisions of the Vatican Council and exposed the historical and dogmatical untenableness of its decrees. Indeed, the last period in his intellectual development as a theologian, marked by his rupture with the Romish See on account of its Ultramontane tendencies, dates from his first connection with this sheet as a regular contributor in 1861. In short, it has always been the promoter of liberal intellectual movements in Germany, and the favorite organ of scholars for the popularization of their researches and the promulgation of their ideas from the time of Goethe to the present day. That it has suffered much tribulation from censorships during its long career hardly needs to be stated, and in several crises it required all the tact and energy and influence of Cotta to save it from suppression.

—"None of the larger London picture shows," writes a correspondent, "will attain a higher average than that reached in the annual exhibition of the New English Art Club, opened on the 13th of April. This club has been in existence nearly six years, but though at the start Mr. Sargent and Mr. Parsons were almost the only artists of made reputation who belonged to it, its influence is already marked; and though it has in its short career seen vicissitudes, its latest exhibition is really its best. In the beginning it was made up of three distinct groups among the younger and more brilliant British artists—the Cornwall men, the Scotchmen, and the handful of Londoners who accept Impressionism as their creed and Whistler as their master. Last year quarrels led to the desertion of the Cornish clique, success elsewhere kept the Scotch painters from contributing their most important work to its show, and it seemed as if the days of the Club's greatest artistic prosperity were at an end. To make matters worse, a too large and very badly lighted gallery was engaged, and to fill it far too many pictures were hung. Hitherto it had been one of the great charms of the Club's exhibitions that merit rather than number was the chief standard of the Hanging Committee. This spring there has been a return in the right direction. The show is given in the very small Dudley Gallery in Piccadilly, and only about a hundred canvases are included, no exhibitor being allowed to contribute more than two. Thus, it has not been necessary to accept anything and everything just to cover the walls, while the pictures can all be seen comfortably and pleasantly in an afternoon's visit. Many men one looks for here are unfortunately absent. There is nothing by Mr. Whistler, Mr. Sargent, Mr. Alexander Harrison, Mr. Parsons, or Mr. Stott of Oldham. The Newlynites have not come back to the fold; several of the leading Scotchmen do not exhibit. But then, on the other hand, almost every picture, with the exception of a small outbreak of sham Manets, has been painted because the painter had something to say for himself and wanted to say it in his own way. For that which makes the work of most of the exhibitors interesting, even when one cannot honestly like or commend it, is the desire always manifested in it to solve some new artistic problem. There is among them no slavery to hide-bound tradi-

tions and conventions. To Royal Academicians and the average British artist, they stand in very much the same relations as the Frenchmen who exhibit in the Champ de Mars hold to those who remain faithful to the Champs Élysées. The most noteworthy work has been contributed by Mr. P. Wilson Steer, who very sensibly has ceased to be the mere reflection of Monet he at one time tried to make himself, Mr. Walter Sickert, Mr. Sidney Starr, and Mr. Paul Maitland, all of whom call themselves Impressionists. Their names as yet are little known in England, hardly at all in America; but if they continue to do work as good as that which they exhibit this year and to make such worthy artistic experiments, they must in the end command the respect of the public, now rather inclined to ridicule them, as they have already aroused the interest of all artists, even of those who differ from them entirely in theory and method."

FREEMAN CLARKE.

James Freeman Clarke: Autobiography, Diary, and Correspondence. Edited by Edward Everett Hale. Boston: Houghton, Mifflin & Co. 1891.

We have here a book which hardly keeps the promise of its title-page in some particulars and does more than that in others. The "Diary and Correspondence" are much less in quantity than the editing. Dr. Clarke was not a diarist in the manner which gives diaries their principal if sometimes questionable value to the reading world. He does not pour out his soul, nor does he indulge in lively and satirical characterizations of his acquaintances and friends. His diary, at least as given, is but a meagre and extremely partial record of things done or planned. It reflects the writer's busy, crowded life. If there was more than this at hand, it has been repressed by the spirit of delicate reserve, the distaste for intimate disclosures, which is a characteristic aspect of the book. It is evident from the fragment of autobiography and from the known habit of Dr. Clarke's conversation—full of personal incident and recollection—that if he had attempted a diary dealing frankly and freely with persons and events, it would not have needed any spice of malice, which he had not to give, to make it of engrossing interest. But he was too intent upon the task work of his ministry, and too earnest in his public spirit and reformatory zeal, for such delightful play.

The correspondence, also, has a disappointing character, but only from its slightness relatively to the whole book. Dr. Clarke's letters and parts of letters are only eighty-nine all told, and they are generally so good we wish them more, and wonder why they are not. They admit us much more than does the diary to the writer's bright and happy and affectionate disposition. He was a devout astronomer, by inheritance from his father, who could do almost anything but make a living, and in 1859 he went to Illinois to see a total eclipse of the sun. The letter describing the event is remarkably impressive. His deep interest in astronomy, showing itself here and in his little manual, 'How to Find the Stars,' with the lantern he invented for the student's help, was a delightful manifestation of his versatile intelligence. Some of the earliest letters are among the most interesting, for they are written to Emerson, and we have the replies. Clarke was then (1838) preaching in Louisville, Ky., and George Keats, a brother of John, was his chief companion. Clarke was editing the *Western Messenger*, and Emerson sent him for it "The Humble Bee," "The Rhodora," and "Good bye, proud world." There are also early letters to Margaret Fuller and Wm. Henry Channing, and in these, with the Emerson letters, we feel the pulse of the Transcendentalist Movement beating strong.

The "Autobiography" is a fragment eighty pages long. Of its six chapters, the second and third, which for the most part appeared in the March *Atlantic*, received, in our notes upon the March magazines, their rightful meed of praise. They are not more delightful than the other parts, and the whole fills us with sorrow that Dr. Clarke did not sooner take his task in hand. The fragment was written in 1883, and, effortless as it appears, the weary pen was laid aside when all the best remained to tell. The chapter on his Cambridge studies, which was not included in the *Atlantic* extracts, deals with the Harvard of 1825–29 with extreme severity. It appealed to emulation, not to curiosity; to the love of rank, not to the love of knowledge. A solitary exception is made in favor of Prof. Farrar's teaching in physics. Clarke's three years in the Divinity School have no memorial from his own hand. The concluding chapters, on his Kentucky ministry, are equally interesting and instructive; the latter as exhibiting the relations of the public mind to slavery in the third decade of the century. The pro-slavery sentiment was much less "vigorous and rigorous," the anti-slavery sentiment much more widespread, and its speech much freer, than at a later day.

No other aspect of Dr. Clarke's life is set forth with so much clearness, force, and justice as his anti-slavery activity, thanks to his friend and classmate Samuel May, who furnishes in chapter xiii. a monograph of nearly forty pages on his anti-slavery attitude and work. The personal matter has, as was proper, a succinct historical setting. The comparatively full account of Clarke's Kentucky writing and speaking is highly creditable to his conscience and his courage, and is, at the same time, significant of a public mood more tractable than is generally remembered now, and soon to be succeeded by another which, had he come in contact with it, would have proved his soul much more effectually. That he would have been equal to the trial we cannot doubt, though it had meant, as for Lovejoy, the spoiling of his goods, and martyrdom. He was never wanting in moral or in physical courage. For the last, witness his going to the top of Salisbury spire, the last thirty feet on the outside by means of iron staples, and standing beside the vane four hundred feet in air, a story to which the vivid imagination of Mr. Hale has added nothing. Dr. Clarke was never formally an abolitionist, but was in as sympathetic relations with the anti-slavery societies as any one not with them altogether. It will be refreshing to the Unitarian mind to read that in 1845 he was one of 173 Unitarian ministers signing a vigorous protest against slavery as inhuman and unChristian. This must have been a large majority of all the ministers of the body. The writing of the protest fell to Dr. Clarke. Mr. May follows his anti-slavery spirit through the war and all its subsequent manifestations. He says—and coming from him, one of the last surviving of Garrison's first lieutenants, it is praise from Sir Hubert Stanley—"Few men, except the most devoted members of the Anti-Slavery Society, gave more time, thought, and labor to the overthrow of slavery than Mr. Clarke did."

There are still fourteen chapters unaccounted for, and the bulk of these is evidently from the editorial hand, the fusion of it with the diary and letters being less complete than an ideal standard would demand. What Mr. Hale has written is extremely sympathetic; perhaps too eulogistic for the best effect; a little honest difference here and there would have been reassuring. Where it is so difficult to find a fault, the wise biographer will imagine a possible one to save himself from that monotony of praise which, if it does not breed suspicion, makes the reader tired of hearing Aristides called the Just. There is little in Mr. Hale's chapters that is characteristically his, little of the concrete realism of his habitual manner; but, instead, much happy generalization. There is much discontinuity in the arrangement—sometimes between two sentences, as between two acts at the play, a dozen years are supposed to have elapsed; and there are omissions of surprising laxity. For example, the index gives but one reference to Dr. Clarke's 'Ten Great Religions' when there should have been three, but the mention in the text in every case is purely incidental. Yet here was a book which, without being very scholarly or thorough for the time when it was written, and while maintaining a central thesis of quite doubtful validity, has done more than any other to increase the popular appreciation of the non-Christian religions and rebuke the arrogance of Christian pride; to say "than all others" would hardly be too much. Another singular omission is that of any proper mention of Dr. Clarke's poetic faculty. It is implied in several poems given in full, the book ending with the last and most beautiful he ever wrote (April 4, 1888, his birthday, a few weeks before his death); but there is no mention of his many noble hymns, nor of his translations in 'Exotics,' seventy-four out of the ninety, showing a gift of quite remarkable genius in this kind.

Another omission is that of any circumstance pertaining to the establishment of Dr. Clarke's society in the "Indiana Place Chapel." Suddenly we find the Society there, and chapel and service are very prettily described by Dr. Holmes in his character of Professor at the Breakfast Table. On the 26th of January, 1845, Mr. Clarke exchanged with Theodore Parker, and the day is set down in his diary as "Black Sunday," which argues that the secession straightway of fifteen parishioners did not take him by surprise. The page given to this matter is but scant for its importance, and with Dr. Clarke's direct political activity we are made acquainted even less liberally. There is no mention of his vigorous opposition to Butler's pretensions in Massachusetts politics, except a casual one, by Mr. Higginson (in an excellent account of his relation to the agitation for the political rights of women), of Dr. Clarke's happy phrase, in the Republican Convention, "A bolt is always in order." The suspicion can hardly be escaped that Mr. Hale's easy-going optimism has made him somewhat inappreciative of the capacity for moral indignation in his friend. To any one who knows what it meant for Dr. Clarke to take the course he did in 1884, how utterly inadequate will seem the treatment of that matter! There is not a hint that it had any tragic implication. Hardly worth noticing in comparison is the reference to the Unitarian Convention of 1865 which instituted the National Conference. There, for once, Mr. Hale drops into fiction palpably. The "harmonious convention" deserves and will receive the tribute of a smile from those who know how very inharmonious it was. The date of Dr. Freeman's installation at King's Chapel "without the help of any bishop" is given as 1782, when it was 1787; and the younger Henry

Ware (p. 89) did not succeed Emerson as pastor of the Second Church in Boston, but was succeeded by him.

But, however deficient in some respects Mr. Hale's chapters, and however defective in others, they do not fail to bring out clearly in the main the course of Dr. Clarke's experience, the force and beauty of his character, and the range and quality of his work. The faithful minister is here, the industrious writer, the social and political reformer, full of energy and hope, a man rich in friendships and in domestic love and peace, made tenderer by pathetic loss. The closer we come home to him in his personal life, the more does he engage our admiration. He came to Boston in 1840, hoping to make a new society quite different from others of the time, and he had large success, though not in all the particulars of his hope. As a "free church" the Church of the Disciples was less and less successful as the years went on. His liberality was inspiration and encouragement to many younger men; then came the scientific wave and carried them beyond him, leaving him, strangely enough, for twenty years to wear the honors and to suffer the reproaches of a conservative position. From being the critic of the "Unitarian orthodoxy" that was denounced by Channing, he became its representative man, but it was a new orthodoxy when he became so, and he had done as much as any one, except Theodore Parker, to make it so.

In another respect his later did not fulfil the promise of his earlier life: there was less of intellectual freedom in his mental operations as time went on. Consider the long list of his theological and religious writings after 1850, and the trail of the apologist is over them all. Their rationalism is their dominant chord—rationalism in its narrower German sense: the explaining away of what seems irrational; the plausible smoothing over of real difficulties with unreal solutions. And this was so because the impulse to do good was the controlling impulse of his life. He deliberately accepted the tendency to good or evil in a doctrine as a test of truth, and all doctrines appealed to him preeminently as calculated to increase the amount of goodness in the world and soothe its sorrow and distress. He was not a profound thinker nor a careful scholar, and he did not win the audience of those who care a great deal for serious thinking and for careful study. Of this he was aware, and by it he was not troubled, for he had great compensations. He spoke to hundreds once a week, he wrote for many thousands every day. The circulation of his writings was immense, and it answered the prayer of his youth, for it brought into the communion of his invisible church thousands who were not of the Unitarian fold. No other has done so much to commend Unitarianism to orthodox believers, and few, if any, have done more to break down the sectarian divisions of our American life.

MEYER'S KILIMANJARO.

Across East African Glaciers: An Account of the First Ascent of Kilimanjaro. By Dr. Hans Meyer. Translated from the German by E. H. S. Calder. With 40 illustrations and 3 maps. Longmans, Green & Co. 1891. Royal 8vo, pp. xx, 404.

NGAJE NGAI, the House of God, as the Masai call Kilimanjaro, is in many respects the most remarkable mountain in the world. An isolated mass, it rises more than 17,000 feet above the level of the surrounding plain, surpassing by 3,000 feet Ararat's elevation above the Armenian plateau. Lying only three degrees south of the equator, there is upon its slopes every variety of climate and vegetation. Within a range of twenty miles the traveller passes from the sun-scorched barren steppe, where the rain is scanty, through a tropical paradise with perennial streams bordered by gardens and plantations, through a region of perpetual moisture whose dense vegetation is a survival of the carboniferous age, by alpine pastures, to the summit where is eternal ice and snow. Although it was known from native reports to the Portuguese in the early part of the sixteenth century as the Ethiopian Mount Olympus, it was not seen by a European until 1848. Since that time it has been visited frequently by travellers, hunters, and missionaries, and a monthly post now binds it closely with the civilized world. In the recent partition of Eastern Africa between Germany and England the mountain was given to the former country, at the express request of the Emperor, it is said; England receiving the forest-oasis, Taveta, at its foot. As this is the rendezvous of all caravans to or from the coast, its possession implies a control of the trade with the mountain tribes—an advantage which Germany, apparently, was slow to recognize. While the southern face of Kilimanjaro is well known, and has often been described, few travellers have climbed to the barren plateau from which its two peaks rise. Only one serious attempt, in fact, had been made to reach the top before that of which this sumptuous volume is the record. This was by Dr. Meyer himself, and it failed because of insufficient preparation. Profiting by this experience, he organized a new expedition expressly for this object, and finally succeeded in planting the German flag on the highest peak, though at a cost of toil and exposure hardly commensurate with the results obtained.

The main purpose of the book is, of course, to describe this ascent, but some of the preliminary chapters, briefly sketching the history of the mountain and narrating the incidents of the march from the coast, are among the most interesting of all. The author is unusually successful in picturing the make-up of the caravan and the ordinary incidents of life in camp and upon the road. The daily morning routine is as follows:

"At the first streak of dawn I awake and call Ali, the captain of my Somál. Immediately the camp begins to show signs of animation. '*Ondoka, funga mkeka*' (Get up, fold up your mats!) cry the headmen. Yawning, and still half asleep, the men bestir themselves, crawl out of their cosey rugs, in which they have passed the night on the ground, gird up their loin-cloths, and begin to drag their loads from the stack in which they have been piled over night. The Somál and Askari set to work to strike the tents and pack the beds and other furniture, keeping time to a rhythmic chant the while. Meantime our cook brings us a cup of steaming cocoa, which we drink standing, and snatch a morsel of cold meat. '*Tayari?*' (ready?) I inquire of the headman. '*Tayari*' (ready) is the reply. Having noted the time and the readings of my thermometer and barometer, I give the word to start, '*Haya!*' and the caravan falls into marching order."

While actually on the road, Dr. Meyer's own duties are sufficiently arduous:

"With the very first step begins the troublesome task of plotting the route. At every slight change of direction I consult my watch and my compass, and carefully make a note of the readings. At every perceptible change of level I do the same by the aneroid. If any considerable hill or mountain comes in sight, I take its bearings by the prismatic compass, and the result is likewise recorded in my field-book. Thus every two or three minutes some observation has to be made, not to speak of the bearings that are taken without making a halt. I never have my instruments out of my hand until we are in camp again."

The first view of the mountain was in the early morning while they were still a long distance from the foot. A thick cold fog which had enveloped the camp during the night was suddenly rent apart by the first rays of the sun, "and above the clouds—apparently suspended in mid-air—hung the snowy dome of Kibo, the mountain's highest peak. Its sister-peak, the Mawenzi, was hidden behind a mass of heavy cumulus cloud—all except the magnificent unbroken sweep of its northeastern slope."

The mountain tribes known as the Wa-jagga, inhabit a tract of five hundred square miles in extent, which lies between an elevation of 3,600 feet and the lower edge of the forest. They are twenty in number, and live in a state of chronic war with each other—a condition which is encouraged by the Arabs, who buy as slaves the unfortunate natives taken captive in these wars. Although in a very backward stage of civilization, they have devised an admirable system of irrigation, and are exceedingly industrious. "On every ridge and hollow, and along the banks of every stream, men, women, and children alike were busy with hoe and mattock preparing the ground for the sowing of maize, millet, and beans, and the planting of tobacco, bananas, and sugar cane, at the commencement of the approaching wet season. With the utmost care the plantations are cleared of all old roots and stumps, and the artificial irrigation channels thoroughly repaired where necessary." Dr. Meyer made his headquarters at the boma of Mareale, chief of Marangu, of whom he gives a most favorable account as a remarkably intelligent negro and a wise and just ruler. In this latter respect he contrasts strongly with the better-known Mandara, for more than twenty years the chief of Moji. Leaving the most of his followers at this place, he proceeded with a few picked men to make a camp in the upper edge of the forest just half way from the summit. Then, with his white companion and a coast negro of exceptional vigor and trustworthiness, he climbed to the saddle-plateau connecting the two peaks, where, at a height of 14,200 feet, he pitched his tent. Here he was able to stay nearly three weeks, as he received supplies every third day from the half-way station, which in its turn was provisioned from the main camp. During this time he made four ascents of Kibo and three attempts at Mawenzi. These latter were unsuccessful, because of the extraordinarily steep and jagged character of its lava precipices. Their constant disintegration, causing incessant avalanches of earth and stones, was also a serious danger to the climbers.

The ascent of Kibo was toilsome and perilous. The last 2,000 feet was up a series of ice precipices, broken by yawning cracks and crevasses, the last forming a blue wall of pure ice varying in height from 15 to 260 feet. This was finally scaled, and on October 5, 1889, the flag was planted, at an altitude of 19,720 feet, on "the loftiest spot in Africa and in the German Empire—Kaiser Wilhelm's Peak." The summit was found to be a crater with a diameter of a little less than half a mile and from six to seven hundred feet deep. Through a notch in the western wall the accumulated ice of the caldera falls as a mighty cascade, and flows down the mountain-side "a glacier of the first order." In the centre of the crater is a cone whose ice-free top indicates that some internal heat is still retained in the long-extinct volcano. Their party's stay on the pla-

teau was marked by few incidents. The extremes of temperature were very trying, the summer heat of midday being succeeded at night by cold as great at times as 6° Fahrenheit. "On one occasion, in the course of a single quarter of an hour, the thermometer fell from 88° to 33° Fahrenheit, and whenever the mist came as the herald of a snow-storm the fall was even greater." Animal life was naturally very scanty, though elephants and eland were seen at a great height above the forest, and the body of an antelope was found within the crater itself! Besides, there were "a few rock swallows, stonechats, lizards, beetles, spiders, and bees, all of a uniform dark gray color—a sombre tint which not only absorbs the rays of the sun, but also makes the animals invisible to their enemies against the dark background of the prevailing volcanic rocks." The predominant color of the vegetation, "alike of leaf and stem and flower, is the blue anthocyan tint, which possesses the remarkable property of absorbing the intense light of these upper regions and transforming it into heat."

The approach of the rainy season prevented any further exploration of the mountain, and Dr. Meyer was obliged to descend without having traced the great glacier to its foot. Nor was he able to examine the northern slope, which differs very materially from the southern. It is much steeper, and has a comparatively small rainfall, so that the belt corresponding to the fertile Jagga is pasture land occupied by the Masai and their great herds of cattle. Before he returned to the coast, however, he made an excursion to the little-known Ugweno, a mountainous region lying some twenty miles south of Kilimanjaro. On the road a tremendous thunder-storm burst over them. "The flashes of lightning followed each other at the rate of forty to the minute, with an effect which was literally blinding. The sky seemed to be one vast sheet of flame; but I noticed that the electrical discharges mostly occurred among the clouds, and did not strike the earth. This fact goes far to explain why the negro, who, as a rule, stands in such awe of the forces of nature, has no fear of a thunder-storm." On the return march the camp was suddenly attacked by an army of driver-ants (which always carry on their marauding expeditions during the night), and had to be abandoned. In this army

"there are three distinct classes or castes. It is officered, as it were, by the largest and strongest class, the members of which are distributed at stated intervals throughout the procession. They are provided with sharp, horned mandibles as long as the insect's body, and their work is to seize and, if possible, slay every living thing that comes in their way. The booty is next torn to pieces by the larger of the two classes which make up the rank and file, which are provided for the purpose with sharp, straight mandibles, about half the length of their bodies. The pieces are then taken up and carried away by the third and smallest class, which have their mandibles quite short."

Though these ants prey largely on insects, they do not hesitate to attack harmless reptiles, and even some of the smaller mammals.

The last chapter contains a brief geological history of the mountain, a description and explanation of its peculiar meteorological phenomena, and the author's views in respect to the German interests in East Africa. His views differ materially from those of most writers upon the development of this part of the continent. In respect to the German Protectorate he says, four-fifths is an "unending waste of barren, almost uninhabited steppe, savannah, and bush." Even the most valuable part is practically worthless; "from a European standpoint, the commercial value of the products of Kilimanjaro so far is *nil*." He holds that it is a grave mistake to attempt to establish stations in the interior, on account both of the unhealthiness of the climate and of the unproductiveness of the soil, and that Germany's true policy is to confine her operations to the coast, leaving the natives to bring in their produce "after their own time-honored fashion, which would seem after all to be the one best suited to the nature of the country." There are several appendixes, in which some of the scientific results of the expedition are given. These include lists of more than two hundred different species of lichens and mosses, many of them new, to the collection of which Dr. Meyer and his companion gave particular attention. A bibliography of works and papers in scientific journals referring to the Kilimanjaro region contains two hundred and eighteen titles, mostly in German and English.

It is difficult to praise too highly the typographical beauty of this volume and the excellence of its illustrations and maps. A word also should be said in commendation of the translation, which is admirably done, even the purely scientific passages being rendered into clear and idiomatic English. The work as a whole, we do not hesitate to say, should be placed in the first rank of books on Africa. Its range is necessarily more restricted than many and its additions to our knowledge are comparatively unimportant, but it is surpassed by few in sustained interest, in picturesque detail, in apparent truthfulness of description, and especially in the impression left of the author as a man just in his dealings with the natives, and one who inspired his followers with confidence and affection.

RECENT SPANISH FICTION.

Angel Guerra. Por B. Férez Galdós. Madrid: La Guirnalda. 1891.

Nubes de Estío. Por José María De Pereda. Madrid: M. Tello. 1891.

Scum. By Valdés. Authorized edition. United States Book Company.

Doña Luz. By Juan Valera. Translated by Mary J. Serrano. D. Appleton & Co. 1891.

If fecundity is one of the marks of the higher order of creative genius, Señora Bazán is undoubtedly right in claiming it for her contemporary, Galdós. In sight now of his fiftieth volume, he writes with undiminished vigor, on as generous a plan as ever, and with the best qualities of his style still undimmed. His story this time is of a man who starts out as a Socialist, concerned in an abortive revolution, the companion of men and women of easy morals, and who ends a conservative property-holder, desperately in love with a woman who is bent on becoming a sister of charity. The successive steps of this transformation are traced for us with Galdós's accustomed skill. The scene between the scapegrace Angel and his proud old mother on her deathbed, where each maintains an appearance of believing in the other, though a stream of accusation and recrimination is all the while flowing hot in their minds, each divining the other's feigning, each more than half suspecting that the assumed manner is no real mask to the other, yet each using only language of affection, until at last a chance gesture lets the torrents loose—this scene, with its clear insight and dramatic development, is masterly. The author adds one more to his gallery of children's portraits—that of a six-year-old girl whose preternaturally, or, as it turns out, morbidly, active mind keeps the reader on the stretch to imagine what she will say or do next.

Pereda valiantly sticks to his province, in his latest novel, though he leaves his beloved peasants and fishermen for the time being, to give us a picture of society in the city of Santander at the present day, when the "Summer Clouds" in the shape of Madrid fashionables are there to take the baths. All classes of these summer visitors he had already hit off for us in his 'Tipos Trashumantes,' and, as far as they are concerned, we simply meet old friends in this story. The gist of it is the scheme of an impecunious nobleman from the capital to marry a spendthrift son of his to the daughter of a wealthy and snobbish merchant of Santander, the delight of the latter's family at the thought of such a distinguished alliance, the supposed acquiescence of the young lady interested, and the final catastrophe brought on by her resolute refusal to go on with the affair, and her determination to remain faithful to a provincial lover whose existence was unknown to her parents. The author, as usual, cares little for his plot except as furnishing him an opportunity for those minute characterizations which are his delight and his inimitable distinction. They fairly swarm in the volume. The Madrid journalist, "doing" the summer resorts on the northern coast for his paper, is himself "done" with a realism quite beyond his own command. A most vigorous defence of provincial taste both in literature and art is put into the mouth of one of the characters, as against the lofty and, Pereda says, unfounded assumptions of Madrid. It gives one a shock to find such an authority as his for the assertion that the only epic poet Spain ever had is now living, and writing in Catalan, and that the finest descriptive genius since Cervantes is also using that dialect.

In Valdés's last novel, appearing simultaneously in English and Spanish, he adds to his pictures of manners in the provinces an alleged picture of the life of the Madrid aristocracy. We say alleged, because he has been accused by responsible critics of gross ignorance of the society which he pretends to paint. Luis Alfonso filled a couple of columns in *La Epoca* with details showing Valdés's lack of acquaintance with aristocratic customs in the capital, and Señor Gomez de Baquero had more to say in the same line in the same paper. Most formidable of all comes Señora Bazán, in her *Teatro Critico* for February, saying that "'La Espuma' discovers the author's almost absolute ignorance of the medium in which his characters move." This round assertion she has, of course, the best right in the world to maintain as respects the aristocracy of blood, and she declares also that it will stand not only for "the *blue* aristocracy, but also for the *yellow*, or *bank-note colored*," of which the novel principally treats. This is a terrible indictment for a writer who piques himself on his realism. And when we take into account Valdés's virtuous forswearing of adultery as a motive for a novel, in his preface to 'La Hermana San Sulpicio,' and his cool charge that the French use of it was purely mercenary, and then discover that his latest story reeks with adultery, we come upon something more than an artistic fault. In Pereda's novel noticed above there is a passage which is so astonishingly applicable to this book of Valdés's that it seems as if it must have been aimed at it. He describes a provincial author staying long enough in Madrid to pick up all the salacious gossip of the gilded youth of the capital, and then going home to launch a book on Madrid society. "But

the fact is, that no such frail marchionesses exist, nor such swindling bankers, nor any of the things set forth in the book; none of it ever was true or ever will be; and what shadow of truth there is in it is of an entirely distinct sort —elegant, distinguished, such as can be neither understood nor described by the ingenious rustic who has ventured out of his wilds in an evil hour for his reputation."

An introduction is furnished by Mr. Edmund Gosse, the editor of "Lovell's Foreign Series," in which 'Scum' ranks as No. 9. It consists of a hurried sketch of the development of the modern Spanish novel, and an appreciation of Valdés. As it is confessedly based upon second-hand knowledge, it occasions no surprise to find it inadequate and, in some respects, positively misleading. Thus, to call Fernan Caballero the leader of the romantic school, is a blunder from which Mr. Gosse would have been saved if he had more carefully read the volume of Señora Bazán's from which he makes a single quotation, 'La Cuestión Palpitante.' One can only gasp at the hideous mistranslation allowed to stand in the introduction, "The Idyll of a Farm" for "El Idilio de un Enfermo." The English title, 'Scum,' by the way, is a vile rendering of 'La Espuma'; the latter word is in perfectly good use to denote the upper ten of society. The translation, in general, is faithful, but is marked by an extraordinary number of slips, evidently due to sheer carelessness, and by too many gross blunders. We cannot take space to enumerate these, but may assure the reader of the English version that wherever he comes upon a passage that is perfectly mystifying or absurd on its face, he may lay the blame upon the translator, not upon Valdés. We must make mention, however, of the remarkable liberties taken with the text of the original. Phrases, paragraphs, and one entire chapter are bodily omitted, and new chapter-divisions with improvised headings are introduced. The excisions are made on the score of grossness, apparently, but, after all, nothing could be more gross than some of the parts that are left in, and, in any case, the reader ought to be advised that he has an expurgated edition in his hand.

Valera's 'Doña Luz' has the distinction and purity of style that mark all the writings of that Spanish classicist. The story he has to tell almost gains importance by his exquisite manner of telling it. Still, when all is done, it is only a simple and graceful tale, not touching life broadly or at many points. Valera's own preface (not translated) shows that he has a more modest idea of his performance than that entertained in the region of Franklin Square. The translation is such as was to be expected of Mrs. Serrano; if she has not been able to preserve the full charm and grace of the original, it is because they are beyond the reach of any translation.

CARD GAMES.

The Handbook of Games. Enlarged edition, with contributions by Dr. William Pole, F.R.S., Maj.-Gen. Drayson, Robert F. Green, "Berkeley," and "Baxter-Wray." Vol. II. Card Games. London: George Bell & Sons; New York: Scribner & Welford.

The Laws of Euchre (as adopted by the Somerset Club of Boston March 1, 1888). With some suggestions about the play. By H. C. Leeds and James Dwight. Boston: Houghton, Mifflin & Co.

A Practical Guide to Whist by the latest scientific methods (with the laws of the game). By Fisher Ames. New York: Charles Scribner's Sons.

The Thirty-nine Articles of Whist. Printed for private distribution.

THE first book on our list belongs to the useful Bohn's Library, and is a most elaborate revision of the work on games hitherto sold in that series. The chapters on Whist and on Piquet are greatly modified; the descriptions of certain games are altogether omitted, as the games have lost their popularity, and explanations are added of new games which have come into favor within the past few years. It must always be borne in mind that this volume, like the other handbooks of Bohn's series, is of purely British authorship and is calculated solely for the meridian of London. To recall this constantly is to minimize our surprise at the omission of Boston and of All-Fours, "which are seldom played nowadays," the editor tells us; the fact being that Boston is still very popular in certain clubs in New York, and that "Old Sledge" has an unshaken hold on the affections of the Southwest, where indeed euchre is its only rival. Euchre is one of the added games, making its first appearance here with poker and bézique.

A book which all card-lovers would welcome would be a history of card games, showing how they are related one to another, and how they are developed in groups one out of another, and how they follow one another in and out of fashion. The history of whist has been written by the late Abraham Hayward; and the history of piquet and of écarté and of more than one other game has been prepared by "Cavendish" to serve as a preface to his practical treatise on the playing of the game. But there is no general history covering the whole subject and declaring the date of the decline of ombre, for example, and of quadrille, and setting forth the rise of whist, and the slow evolution of poker from the Elizabethan post-and-pair. Boston takes its name from the capital of Massachusetts, though we doubt if it was ever fashionable there. Nap, if we may believe "Baxter-Wray," is also of American origin, which we are much inclined to doubt. From "Berkeley's" account of the introduction of bézique into England, it is certain that the game was popular here several years before it had spread over Great Britain; it came to us from France. Piquet is now more often played in London than in New York, although it is gaining favor here at a great rate, and very properly, as it is an ideal game for two players. Indeed, one might say that as whist is indisputably the finest of games for four, so is piquet the finest of games for two.

Of games for three players there are very few indeed. Cut-throat euchre is the abomination of desolation; bézique suits three fairly, and three can play cribbage with a triangular board to great advantage. But perhaps there is no more satisfactory three-handed game than cassino, simple as it seems; sad to relate, "Baxter-Wray" presents it here as a mere round game and in a most elementary form, making no mention of "building," which gives variety to the play and allows of the adroit inferences and the speculative risks which are the essence of a good card game. We must remark, also, that the same writer treats poker as a mere round game also, and that he fails altogether to apprehend the vital principle of that most fascinating of scientific pastimes. This vital principle is, that a three-fold option must be offered to every player at every stage of the game—he may "go out," he may "call," or he may "raise." The use of the joker is an absurdity, and the prevalence of the jack-pot is greatly to be deplored. Just what "Baxter-Wray" means by one of his assertions we cannot guess. "The suit of hearts, *ceteris paribus*, takes precedence of other suits" (p. 31). This is rank nonsense.

Considering that "Berkeley" acknowledges that rubicon piquet is superseding piquet *au cent*—as it should, for it is a finer and subtler game—we wonder why rubicon piquet was not given the place of honor instead of being relegated to a secondary position after the departing piquet *au cent*. On the whole, "Berkeley's" exposition of piquet is not as clear as "Cavendish's"; and the most valuable part of his treatise is the elaborate calculation of the odds. Nor is his discussion of euchre as thorough or as satisfactory as that contained in the little book by Mr. Leeds and Dr. Dwight. What is of most value in the British book are the carefully calculated tables of chances. But the play of a lone hand is more elaborately considered in the Boston book; and the laws of the game as adopted by the Somerset Club have brought order out of chaos, and should be followed by all serious euchre-players. We could wish that some club of equal position would codify the laws of poker, using as a basis the proposed code drawn up by Gen. Schenck in England to oblige his hostess.

In 1879 Mr. Fisher Ames published in Harper's Half-Hour Series a little treatise called 'Modern Whist,' in the hope "that a concise statement of the principles of whist in an inexpensive form may increase the general knowledge of the correct way of playing." The 'Practical Guide to Whist' which Mr. Ames now publishes is a far more elaborate work than the earlier booklet, and it justifies the claim advanced in its sub-title, of having adopted the "latest scientific methods." The "American leads" suggested by Mr. Trist of New Orleans, and developed by him in conjunction with Mr. Jones in London, are now adopted by the best players in this country and in England. They are arbitrary conventions, no doubt, but so are certain of the other modern improvements of the game; and they are not of frequent use, but they have approved themselves to the most advanced players, and Mr. Ames has done well to embody them in his guide.

The 'Thirty-nine Articles of Whist' is a four-page folder, on which an anonymous lover of the game has skilfully condensed the approved practice of the modern game as to original leads, subsequent leads, trump leads, return leads, the play of the second and the third hands, the signal, the echo, and the discard. Here again Mr. Trist's invention is accepted. Ten "General Remarks" are added, pertinent and to the point. These 'Thirty-nine Articles' may often be of great use to a novice striving earnestly to perfect his play. Perhaps Mr. Foster's 'Whist at a Glance' (to be read on a single playing-card) accomplishes the same purpose even more concisely.

B. F. Stevens's Facsimiles of Manuscripts in European Archives relating to America, 1773-1783. Vol. VII. Nos. 647 to 753. London: B. F. Stevens.

THE manner in which these facsimiles are published is perhaps inevitable, but it makes them very tedious reading. Again and again are we taken over the same ground, and there is no evident reason to suppose that any subject or incident will ever be exhausted. If the editor could give us at once all the papers re-

lating to one subject, he would certainly add to the interest of the collection. This is, perhaps, but a minor matter, for the chief value of the facsimiles must always be for reference, and for that purpose much will depend on the thoroughness of the index; still, the conscientious and thorough reader deserves some consideration.

The seventh volume, like its predecessors, is largely taken up with the correspondence of the American Commissioners in Paris in 1777, with the intrigues in which they were actively engaged, and with the base and sordid treachery which surrounded them. Deane continues to write his incessant "mémoires" in his florid handwriting. He is sensible and forcible enough, but how tired the clerks of the French Foreign Office must have been of him, and what a relief, to them as to us, when Franklin, on rare occasions, draws up a document. Lee grumbles and fumes at his fellow-Commissioners. Hynson and Carmichael, Paul Wentworth and Dr. Bancroft, Lieut.-Col. Smith, and that low wretch, George Lupton, pry about and lie and tell secrets. The Lieutenant of Police of Paris has his eye on them all (677). He has appointed a commissary and twelve *exempts* to watch over the American deputies and to spy on all persons communicating with them, or with the English Ambassador, Lord Stormont, and these underlings are ready to pursue any scent to the distant parts of the kingdom, at a moment's notice (694). Does diplomacy nowadays involve so much dirty work?

We may say for the American envoys that at least they were accomplishing their object of drawing France into the quarrel. The English Government, on its side, was failing in its attempts to carry on the war. "The Peculation in every profitable Branch of the service is represented to be enormous, and as usual It is attended with a shocking neglect of Every Comfort to the Troops," writes Wedderburn to Eden (707, Sept. 6, 1777). "The Hospitals are Pest-houses, and the Provisions served out are Poison, those that are to be bought are sold at the highest prices of a Monopoly." And that he tells truth is shown three years later, when Sir Henry Clinton writes to the same person: "Not an ounce of this year's provision arrived. If it does not soon we literally starve" (743).

The latter part of this volume is partly occupied by reports addressed to William Eden in England by William Smith, the Tory Chief Justice of New York. We see in these letters the hopes and fears of the Loyalists, their discontent at Clinton's incapacity and at his continual squabbles with Admiral Arbuthnot. "If nothing is done, and you pay for that nothing, I would mulct two People I could name, to raise a Temple to Concord," writes Smith at the end of 1780 (746). The Chief Justice was a patriot, and had long hesitated which side to take in the contest. Although his loyalty to the old Government had carried him into the Tory ranks, he was not disposed to favor arbitrary measures. Expecting that Lord Cornwallis will soon conquer Virginia and prophesying other successes, he writes to Eden as to the proper course for the powers in England:

"But are you ready to secure what you may [have] acquired? If the military are to govern as well as conquer—govern *the Loyal*, who have assisted to dethrone the usurpers, prepare to empty your Island to garison this Continent. From the moment in which it is possible to convene a friendly assembly, the Power of the army should be confined to its proper duty, or it will convert Friends into Foes." . . . "If every Thing is to be left to chances till the moment of the construction, I insist that Lord Mansfield be the Head of the next commission to America. No matter for his Library—his own Notes excepted" (734).

We see from this that William Smith was quite ready to speak his mind freely. That he attributed a sufficient importance to his own opinions, when given, we may infer from an anecdote told in Sabine's 'American Loyalists' (vol. ii., p. 313). After the British evacuation of New York in 1783, Smith moved to Canada and was made Chief Justice of that province, but continued to take a warm interest in the affairs of his native country. In 1789, when the Federal Constitution was under discussion, Dr. Mitchell of New York happened to be visiting Smith in Quebec. One evening the Chief Justice called his visitor into his study, and, after searching among his papers, pulled out one which contained a plan of government composed by himself. The piece was long, elaborate, and well written, and closely resembled the Constitution proposed by the Federal Convention of 1787; the Constitution of the United States, in fact, under which we live to-day. After reading his manuscript aloud, Smith thus addressed Dr. Mitchell:

"This, sir, is the copy of a letter which I sent to a member of congress in 1775, who was an intimate friend of Gen. Washington. You may trace to this source the sentiments in favour of a more energetic government for your country, contained in the Commander-in-Chief's circular letters, and from this there can be no doubt that the citizens of all the States derived their leading hints for your new form of government."

Report of the Birds of Pennsylvania. By B. H. Warren, M.D., Ornithologist, Pennsylvania State Board of Agriculture. 2d ed. Harrisburg. 8vo. 1890.

It has long been the policy of the Government to foster scientific research, and the volumes put forth by experts in one or another branch of science are both numerous and costly. These volumes have done much to spread a knowledge of our country and its products at home and abroad, and to create a belief that in its patronage of science our Government is wise and liberal beyond most others. The course of the general Government is, in this respect, followed also by the State governments, though on a less extensive scale. That of Pennsylvania has lately issued a volume which in many respects is notable both for its general excellence and for its practical utility. Some two years ago the State Ornithologist completed an illustrated volume on the birds of the State with especial reference to their food-habits. So great was the demand for it that the edition was soon exhausted, and the present is a second edition, enlarged and revised.

The investigations upon which the practical side of the first book was based were due to the fact that thousands of dollars had been expended by several of the counties in payment for the scalps of birds of prey. Under the impression that certain animals—among them hawks and owls—were injurious to agriculture, their destruction was undertaken at the expense of the State. The Westchester Microscopical Society, becoming interested in the matter, took an active part in measures which resulted in the repeal of the unjust and obnoxious law. The scope of the present volume has been somewhat extended, and its chief purpose is to furnish the people of Pennsylvania with a book on the birds of their own State which shall be intelligible and interesting to plain, every-day people with no pretensions to scientific education, and particularly to give to the farmers all available information as to the food-habits of birds.

The author begins with a brief introduction, including a geographical description of the State and a list of the few technical terms indispensable in describing birds, the application of which is made plain by illustrations. The main body of the work occupies 331 pages, which are devoted to descriptions of the birds, to an account of their distribution over the State, and to their nesting and general habits. Each family is introduced by a general account of its distinctive features and the habits of its members, which is concise, yet clear and ample. The descriptions of the birds, while lacking the fulness usual in scientific treatises, are yet plain, simple, and sufficient for the purpose intended, viz., their identification. An appendix of ninety-two pages contains a history of the Pennsylvania Scalp Act, with the reasons for its enactment and repeal; extracts from the reports of the United States Department of Agriculture upon the economic relations of crows, hawks, owls, and the English sparrow; a tabulated list of the birds that struck the lighthouse at Atlantic City, N. J., during the autumn of 1889; a list of publications quoted in the report, and of observers who contributed to it, and a glossary of technical terms. The value and popular character of the work are much enhanced by the abundance of colored plates, which serve greatly to facilitate the task of identification.

We notice with pleasure that the act providing for the present edition authorizes the distribution of one thousand copies to the School Department, for use among educational establishments. Nowhere will a book on birds of this popular character be so thoroughly appreciated and do so much good as among teachers and school-children, and we believe that the number thus employed might have been judiciously increased.

The book is extremely well and tastefully bound, the typography is excellent, and in its general make-up it presents little of the rather forbidding aspect of the usual public document. Considered as a whole, it is an extremely creditable book both to its author and to the State of Pennsylvania. It is to be hoped that the example thus set may be followed by other States, and that a general systematic effort may be made to instruct the public in the life-history of birds, especially in their economic relations to man. In this way better than in any other is it possible to bring about an enlightened understanding of the value of birds, which, once gained, will have more effect in checking the present rage for killing birds for the sake of adornment than any number of sermons against that odious fashion.

English Fairy Tales. Collected by Joseph Jacobs, Editor of *Folk-Lore.* Illustrated by John D. Batten. London: D. Nutt; New York: G. P. Putnam's Sons. 1890. 8vo, pp. xiv., 253.

It was a pleasant surprise to read in Mr. Jacobs's preface: "Who says that English folk have no fairy tales of their own? The present volume contains only a selection out of some 140 of which I have traces in this country. It is probable that many more exist." We always supposed that many more had existed but had disappeared before the progress of education. In fact, since Mr. Halliwell-Phillipps published the first meagre collection of English nursery tales in 1849, almost nothing has been gleaned in this field. We have had copious collections of the Gaelic tales of Scotland

and Ireland, but of English tales only a few have appeared from time to time in the pages of works devoted to folk-lore in general. It was a disappointment, then, to find that apparently Mr. Jacobs had had difficulty to bring together even forty-three English folk-tales, for of this number three are made out of ballads, one is not a folk-tale at all (No. xviii., Southey's 'The Three Bears'), four are Scotch, and two are survivals from America. All but four have already been published (seven in Henderson's 'Folk-Lore of the Northern Counties' and nine in Halliwell).

The editor has treated his material with great freedom, "eliminating a malodorous and un-English skunk" from one of the American stories, and a superfluous Gipsy from one of the English ones, reducing the dialect of a Suffolk tale, inserting an episode and expanding a conclusion in another tale, reducing adventurers from three to two, substituting riddles from an old collection for the poor ones of the original, transposing the incidents in No. xxx, cobbling No. xxxi out of three chap-book versions, building up No. xxxvi out of two stories, largely rewriting No. xxxvii, writing an introductory paragraph to No. xxxviii, changing the heroine's name in No. xxii, etc. Mr. Jacobs has very honestly acknowledged all these crimes, heinous in the eyes of a Folk-lorist, and has disarmed criticism by the promise to reproduce at some future time his originals with literal accuracy in a more extensive work on English Folk-tales. A more serious charge is that of rewriting those of his stories which existed only in "literary English," in the style which he supposes a "good old nurse" would adopt when telling fairy tales. As Mr. Jacobs himself is in doubt of his success in this proceeding, we need not say any more about it, except to remark that the example of the brothers Grimm, invoked by Mr. Jacobs, does not justify this mode of editing.

Of the work as a whole we can speak in terms of the highest praise; for the first time a general collection of English tales has been brought together, and the result only increases our regret at the lost treasures which can probably never be recovered. Some of the versions of well-known stories, such as "Tom Tit Tot," are not inferior to their relatives in other lands. The only criticism we should feel like making is that a number of the stories are very gruesome. We are told, however, that children like to be thrilled by such tales and know that it is all make-believe. It is easy to eliminate these stories in reading to younger children, and probably such as can read themselves will not be harmed.

Mr. Jacobs has greatly increased the value and interest of his book by the notes and references, which he has placed at the end, with the warning that "little boys and girls must not read any further." We hope some of them will, and receive an impulse which may some day lead them into one of the pleasantest paths of study. The notes are excellently planned, the English parallels are given with some fulness, and reference is briefly made to the foreign ones, with information where further variants can be found. One or two errors have crept in which may be corrected here: in No. ii., the reference to *Mélusine*, t. ii., should be t. ii., col. 352, and it contains a parallel not to No. ii., but to No. viii. No. xii. is a variant of No. xxiv., where should be cited the foreign versions in Cosquin ii., 76, and Crane, p. 370, note 32. To No. xv. might be added a reference to Goethe's "Der Zauberlehrling," the source of which is Lucian. The few misprints have probably been seen already by the editor, and will be corrected in the next edition, where the great Weimar oracle should be cited as Dr. Köhler; he ought to be professor of comparative storiology in the first university of the world, but, as a matter of fact, he is simply the librarian of the Ducal Library.

Much might be said in regard to the elaborate note, or rather excursus, on "Childe Roland," which concerns not only Shakspere, Milton, and Browning, and the very elemental stuff of folk-tales and ballads, but also the origin of elves, trolls, and fairies. We can here refer only to the interesting work from which this note and its illustrations are partly taken, 'The Testimony of Tradition,' by Mr. MacRitchie (London, 1890).

It would be unjust to dismiss 'The English Fairy Tales' without a word of praise for the admirable illustrations of Mr. John D. Batten.

An American Girl in London. By Sara Jeannette Duncan. D. Appleton & Co. 1891.

We have already met the American Girl in London. Mr. James has introduced us to her more than once; she has wandered (unrecognizable, however, but for her label) through the three long, weary volumes of many an English novel. To the British novelist, her humor, her independence, her gayety are now as irresistible as her proverbial millions are supposed to be to the bankrupt British peer. But she has seldom seemed more amusing and natural than in Miss Duncan's new book. In her 'Social Departure,' Miss Duncan showed that to a keen observation she brought an even keener sense of humor and unflagging spirits. Her account of her journey around the world was not only readable, but immensely entertaining. It is not easy to do a good thing twice, and her 'American Girl in London' perhaps has not quite the freshness and spontaneity of her first volume; the humor in places is just a little forced; there is here and there too much of a Mark Twain tendency in the jokes. But for this comparison with her earlier work, however, it might seem more satisfactory.

The adventures of her American girl are strung upon a mere thread of a story. Miss Mamie P. Wick, of 4000 Prairie Avenue, Chicago, when circumstances prevent her "Poppa" and "Momma" from coming with her, starts alone for London; is there coldly received by her own relative in the town; is taken under the protection of an English woman of title, who finds her "the only really American girl I've come upon in the whole course of my travels"; with her new friend enjoys a London season; is made love to, without knowing it, by a young Englishman; and, when to her astonishment she finds herself received by his family as his betrothed, flies precipitately for home on the next steamer. But the story is really nothing. It is a mere excuse for the record of Miss Duncan's first experiences and impressions in London. These, apparently, she has written while they were still fresh in her memory—while the solidity and stability of London buildings, the permanence and security of London institutions, still were a source of wonder and delight; while that unmistakable smell of London which we greet with renewed affection every time we return to the great metropolis, was for her still "done up in the present tense"; while a ride in a hansom or on the top of a 'bus was still a novelty. She seldom fails to see the humors of London and London life, always better appreciated by an American than an Englishman; she but rarely misses its true character. With her sight-seeing, with her visits to Westminster and the Temple, we could have dispensed. It is here the humor is most strained, the Mark Twain effects most aggressive. But her descriptions of typical London lodging-house interiors and landladies; of an "at home," with its silent groups and impossible music; of the London shops and the "elegant ladies-in-waiting," with their odious, endless refrain of *Moddam;* of the English young girl and the English young man; of the Royal Academy private view, and a dozen other social functions, are excellent. No one has ever better described the æsthetic gown that even yet lingers on among Socialists and Ibsenites—"the protest against conventionalism, very much gathered, and usually presenting itself in colors unattainable out of a London fog. It almost always went with a rather discouraged-looking lady having a bad complexion and hair badly done up; and invariably it dragged a little on one side."

Miss Duncan is less happy with her pathetic flower-woman, standing hatless and bonnetless near Charing Cross. Who that knows London does not know the inevitable big hat adorned with draggled feathers of the London flower-girl, one of the most characteristic features of the London streets? We doubt, too, very much if the imposing creature who keeps the door of the Métropole, where almost all the attendants are Germans, would have talked pure Cockney or demeaned himself by recommending a 'bus; while we are quite sure that an English girl, had she even known anything about it, would never have spoken of the American *mail* or the hotel *clerk*. In other places the English, as Miss Duncan gives and spells it, suggests Virginia rather than England. And is not "Great Scott!" wholly American? And is "pullin' our leg" really a common expression among Englishmen? These, however, are minor details.

The illustrations by Mr. F. H. Townsend are, as a rule, very good. The pen-and-ink drawings are more successful than the wash—that is, in the reproduction, for we are still waiting for the perfect tone-block. Mr. Townsend does not always follow the text as faithfully as he might. For example, the costume on page 5 is not that worn some twenty-five or thirty years ago; and the boots of the two girls on page 24 are hardly those suggested by the accompanying letterpress.

Life of Francis Higginson, First Minister in the Massachusetts Bay Colony, and Author of 'New England's Plantation' (1630). By Thomas Wentworth Higginson. ["Makers of America" Series.] Dodd, Mead & Co. Pp. iv, 158.

The connection of Francis Higginson with the settlement of Massachusetts was so brief, and his previous life so unrecorded, that the materials for his biography suffice for a mere outline sketch. Under these necessary limitations Col. Higginson has succeeded in presenting a readable life of his ancestor. He has allowed contemporary documents and the older historians, like Morton and Mather, to tell the story in the main, connecting these excerpts by gracefully written comments. The method has its advantages, but the proportion of the story told by Col. Higginson seems unduly scanty; and, as he does not enter largely into criticism in his comments, the biography presents little that is not already familiar. Of the many obscure points concerning the early history of the Salem plantation, the writer has discussed none critically, and the larger problems, of which that settlement was but one at-

tempt at solution, he evidently has considered outside the scope of his plan.

Col. Higginson gives us a brief account of the parentage and education of his progenitor; and, in default of any knowledge of the actual incidents of his college experiences beyond the dates of graduation at Cambridge, draws a graphic picture of university life three hundred years ago. The account of Higginson's ministerial career in England is taken from the 'Magnalia.' Excerpts, chiefly from the Massachusetts Company Records and Higginson's journal and letters, as given in Hutchinson's 'Collection,' tell the story of the transfer to American soil. The same extensive use is made of documents and of the older historians in describing the settlement of Higginson over his Salem flock, and the revolt of the conformist Brownes. The biography closes with a sketch of Higginson's family. In the course of the narrative Higginson's 'New England's Plantation' is reprinted from its third edition (1630), and place is found for the 'Generall Considerations for the Plantation in New England' without absolute denial that Winthrop may have been the author. The result of Col. Higginson's work is a vivacious little book.

It is to be regretted, however, that the writer has fallen into one serious error. He calls special attention to the covenant adopted by the Salem Church in 1629, and on pp. 80, 81, he gives what purports to be that document. But what Col. Higginson has reprinted from Mather is really the renewed covenant of 1636, without the preamble, and is, with the exception of a single sentence which is all that remains of the original symbol, the work in all probability of Hugh Peter, pastor of the Salem Church from 1636 to 1641. The writer has erred in good company in this matter, but it is none the less an error. No question in New England ecclesiastical history was more debated thirty years ago than that of the original Salem covenant. The late Joseph Felt maintained—it would seem largely under the stress of polemic considerations—that a *Direction*, prepared not far from 1665 by John Higginson, son of the hero of our biography, preserved the essential form of the original symbol. On the other hand, the learned Judge White contended, in his 'New England Congregationalism,' that the covenant as given by Col. Higginson is the original. But both were mistaken, and no writer has more clearly perceived their mistake than a late pastor of the Salem church, Charles W. Upham, whose 'Address at the Re-dedication of the First Church, in Salem, Mass., December 8, 1867,' Col. Higginson cites, though without observing this point, in the paragraph following his text of the Salem covenant. Upham holds that the original covenant consisted of a single sentence: "We covenant with the Lord, and one with another, and do bind ourselves in the presence of God, to walk together in all His ways, according as He is pleased to reveal Himself unto us, in His blessed word of truth" (Address, p. 29.) All that follows in the text printed by Col. Higginson is an addition of Hugh Peter's when the covenant was renewed.

This conclusion, which was based by Upham and others solely on internal evidence in the wording of the covenant itself, is made certain by testimony which all the writers on the controversy have overlooked. In a criticism of New England church usages published by William Rathband, London, 1644, under the title of 'A Briefe Narration,' two specimens of Puritan covenants are given (pp. 17-19). One of these he declares to be that renewed by the church at Rotterdam, Holland, "when Mr. H. P. [Hugh Peter] was made their Pastour"; the other is the "renewed" Salem covenant given by Col. Higginson. This passage from Rathband was reproduced by Hanbury ('Memorials,' ii, 309, 310). So great is the similarity of expression between the two documents given by Rathband that both must be from one source, and that the pen of Hugh Peter, pastor successively at Rotterdam and Salem. The original covenant of the Salem church resembled in brevity and simplicity those of the Boston and Charlestown churches; and the nine articles which are appended to it in the form published by Col. Higginson were the result of the disturbances which accompanied the departure of Roger Williams. The writer has fallen into another error on p. 82, where he implies that the covenant published by Upham in his 'Address' is different from that given in the biography under review. It is the same, with the addition of the renewal preamble.

The quotations from printed documents, while in the main correct, show occasional slips in the reproduction of spelling, but the only important errors noticed are on p. 32, where the quotation from the Massachusetts Company Records should read *intimation* instead of "information"; and on p. 115, where the third line of the passage from the same Records should read *Gouno*r instead of "Gount." More material is the wrong citation from Young, 'Chronicles of Massachusetts,' on p. 47, which should be *Sept.* instead of "Nov."; and again on p. 112, where the date of the decision to transfer the patent and government to American soil is given as "August 29, 1630," instead of *1629*. The book is provided with a good index.

Under the Trees and Elsewhere. By Hamilton Wright Mabie. Dodd, Mead & Co. 1891.

THIS is a companion volume to its author's 'My Study Fire,' which we had occasion to speak of as a pleasant collection of indoor reveries and firelight pictures, with a few notes on books and authors. Here we have outdoor sketches, and some readers will recall them from the columns of the *Christian Union*, in which they originally appeared. Mr. Mabie is less interesting as a rambler in the country than as a dreamer and book-lover. He is neither fresh enough for originality, nor observant and precise enough for science—that is to say, he has neither Thoreau's nor Burroughs's vein. His ground appears to be, in the main, sentiment, with an atmosphere (we had almost written a haze) of Emersonianism hanging vaguely over it. The earlier portion of the volume in particular lacks gist; one chapter is too like another, though the topics change. In fact, Mr. Mabie has more style than matter, and consequently wearies. The latter half is taken up with a curious mystification about the Forest of Arden and the Island of the "Tempest," in which the writer feigns himself travelling with his own *Rosalind*, and here he betrays that literary sensibility which at times overpowered his individuality in the earlier work. His obligation to "Ik Marvel" is obvious. There is, however, in these two idealistic papers something of the same weakness of fibre already noticed in the sketches from nature, but with it goes also a susceptibility and a warmth of the literary temperament which would reconcile many readers to worse defects than any here.

BOOKS OF THE WEEK.

A Prince of Good Fellows. American News Co. 50 cents.
Auringer, O. C. The Heart of the Golden Roan. Boston: D. Lothrop Co. 75 cents.
Barnard, Charles. First Steps in Electricity. Charles E. Merrill & Co. 75 cents.
Barr, Amelia E. The Beads of Tasmer. Robert Bonner's Sons. $1.25.
Beal, E. A. The Information Readers. No. 1. Foods and Beverages. Boston School Supply Co. 60 cents.
Blaikie, J. A Text-Book of Geometrical Deductions. Book I. Longmans, Green & Co. 60 cents.
Burton, Chas. V. An Introduction to Dynamics. Longmans, Green & Co. $1.50.
Cahill, Mabel E. Her Playthings, Men. Worthington Co.
Cahun, L. Hassan le Janissaire. 1516. Paris: Armand Colin & Cie.
Caillard, E. M. Electricity. D. Appleton & Co. $1.25.
Chemistry in Space. Oxford: Clarendon Press; New York: Macmillan.
Clowes, W. L. Black America. Cassell & Co. $1.50.
Darwin, C. Geological Observations. D. Appleton & Co.

We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and the West Indies; also make Collections and issue Commercial and Travellers' Credits, available in all parts of the world.

Brown Brothers & Co., Bankers,
NO. 59 WALL STREET, NEW YORK.

European Travel: 6th Summer.

Small and select party of ladies leaving New York June 24; tour of 93 days. Address MISS H. M. BARBOUR, 81 Columbia Heights, Brooklyn, N. Y.

The Nation.

NEW YORK, THURSDAY, MAY 7, 1891.

The Week.

MR. LEECH, the Director of the Mint, is, we believe, quite sound on the coinage question, which is his legitimate field, and his testimony has had considerable weight in the recent discussions about silver. This fact makes his recent irruption into the Treasury Department, with a suggestion that the Government should meet its present difficulties by suspending specie payments, all the more unfortunate because he will not be listened to hereafter on any subject with anything like the same attention as formerly. His proposal to use for current expenses the money now held in reserve under the act of Congress to maintain the redeemability of the greenbacks is, in reality, a proposal to suspend specie payments, for, if the fund were once dissipated, there would not be the smallest chance of its restoration. The whole body of currency cranks would unite in resisting its restoration. They would feel that in this way they were demonstrating the power of the Government to make money for the people. They would enjoy, too, immensely the discredit it would throw on gold, which they hate, just as they love silver. To have the Director of the Mint, of all men in the world, recommend such a policy, will therefore delight them. They will say that here is a man, who probably knows gold better than any one else in the country, recommending its expulsion. He has fathomed its meanness, and fickleness, and distrust of the masses, and its worship of aristocracy, and its unwillingness to go West, and therefore proposes to kick it out.

Our readers may remember Mr. Blaine's contention that he got his right to police Bering Sea from Russia when she ceded Alaska to the United States. It filled the whole of his last great despatch to Lord Salisbury. The *Tribune* was absolutely dazed by the argument, and was short of epithets to describe its splendor and force. The *Journal de St.-Pétersbourg*, in an evidently semi-official paper, now demolishes it from top to bottom, stone by stone. It is as elaborate a piece of work as has ever been performed on our nimble Secretary by critic or enemy. It says that Russia never ceded any rights in sea or land in Bering Sea, except such as rested on the ordinary law of nations, because she never had any to cede, and that the ukase taking in one hundred miles of high sea along the coastline as a little private fishing-ground, which Mr. Blaine has made so much of, was, to speak familiarly, all "poppycock," was never put in force, or meant to be put in force. It winds up by asserting that "the pretensions of the United States in this matter are in absolute contradiction to the most elementary principles of international law."

The *Tribune's* explanation, which has doubtless been received from Washington, is that it is plain that the *Journal de St.-Pétersbourg* does not speak for M. de Giers, the Minister of Foreign Affairs, and that it does not know anything about the matter in hand, and that "the power of nations to extend their jurisdiction over the open ocean for a lawful purpose is recognized by all nations, and has been frequently practised by England," and "has the sanction of all accepted writers, for it is both just and necessary." There is a curious mixture of fatuity and slyness in this. The power of nations to extend their jurisdiction *over their own vessels and citizens* "on the open ocean" for lawful purposes has never been questioned by any writer. But the present controversy is about the power of nations to extend their jurisdiction over foreign vessels on the high seas, for any purpose whatever not recognized by special agreement, like the suppression of the slave trade. No "accepted writer" has ever in recent times recognized any such power, as our sly friend in Washington well knows. Who is his "accepted writer," and what is the page of the work? The *Tribune* also revives the theory of an ocean game law, which enables a government to pursue and recapture on the high seas in foreign vessels the young of wild animals which may possibly have been born in its own territory; but this is too absurd for discussion.

The notification which the Chinese Government has sent to Washington that it is unwilling to receive Henry W. Blair as American Minister, ought to make the President ashamed of himself for appointing him to the place, but it probably will not. If the United States had been searched to get the most conspicuously unfit man for the Chinese mission, Blair would have been selected after competitive examination as distancing all others. He had been rejected as Senator by his own State after a career in the Senate which had made him a butt for the jeers of the whole country, when the President, for no other reason than that he was "out of a job," appointed him Minister to China, whose people he had brutally assailed in an ignorant way peculiarly his own. The appointment was, in fact, the most striking illustration we have had of the disgraceful use which our Government habitually makes of its foreign missions, giving them as rewards for political service—"plums" for politicians. President Harrison and Secretary Blaine have done this in a more wholesale manner than almost any of their predecessors, using all the first class missions to reward their own supporters, in the press and out of it, without regard to their fitness for the posts to which they were assigned. Blair happened to be only a little more unfit than some of the others, and, unluckily for him, the barrier of language has not been sufficient to prevent the Chinese Government from obtaining an accurate idea of his personality.

Nevertheless, "I should," says the great man, "have proceeded to China, Emperor or no Emperor, but for the order of Secretary Blaine recalling me." In other words, the Chinese would have had to get rid of him by force if they did not want him, had not Secretary Blaine interfered. Blair knows nothing about the diplomatic distinction between a "persona grata" and a "persona non grata." It is all one to him which he is, in his diplomatic career, as long as he can draw the salary. It is fair to Blair to say that he is not as absurd in this view as he seems. It is a view which grows quite naturally out of our mode of filling diplomatic places; but, of course, when it gets into the brain of the born natural, it finds funny expression. When a broken-down politician seeks a foreign mission, it never occurs to him that he is sent abroad to maintain good relations between his own Government and that to which he is accredited. The appointment comes to him solely as a reward for past services to the party; and when any foreign Power refuses to receive him because he is unfit, he feels towards it as he would feel towards a "darned Mugwump" who had opposed his confirmation by the Senate. Blair now says he is going to Japan, which "will suit him equally as well if not better." "The Japanese Mission," he says, "is as satisfactory both as to the character and dignity of the country *and the salary*." We have italicized this last consideration because we are sure that Blair, great a fool as he seems externally, really regarded it as the main chance. But how will the Japanese feel about taking New Hampshire's and China's leavings?

The Democrats in the Michigan Senate, with the help of the Patrons of Industry, have passed the bill which went through the House some time ago providing for the choice of Presidential electors by districts next year, instead of in a single block, as heretofore. As the signature of the Democratic Governor is assured, it is now certain that Michigan's fourteen votes in the Electoral College of 1892 will be divided between the two parties. The coalition of Democrats and Patrons in the Senate followed up the passage of this bill with one making a new division of the State into Congressional districts, which will go through the strongly Democratic House without any difficulty. Under the old apportionment during the past decade, the Democrats have never carried less than two of the eleven districts (their number in 1888), and have gone as

high as five in 1886, six in 1882, seven in 1884, and eight in 1890. Under the new apportionment of the twelve Representatives which the State will now have, the Democrats count confidently upon securing six, even if the Republicans have a majority of the votes in all the districts, as in 1884 and 1888; and they also hope to carry one of the two large districts which will choose the electors at-large.

The Nebraska Legislature also had before it during its recent session a bill providing for the choice of Presidential electors by districts, but it failed to pass. The same policy has been urged in the Ohio Legislature, which is now controlled by the Democrats, but at last accounts it was hardly expected that it would be adopted. Wisconsin is still another State where the system might have been introduced, as the Democrats controlled both the Executive and Legislative departments, but it was not even mooted, we think—certainly not pushed with any zeal. Perhaps the reason was, that the Democrats are so hopeful of carrying the State and securing all the electoral votes next year, that they preferred to take their chances of getting the whole number under the old system than to adopt a new one under which the Republicans would be sure to have several. It is not unlikely that Wisconsin will be a close State in 1892. It gave Harrison 21,321 more votes than Cleveland in 1888, but last fall elected a Democratic Governor by a plurality of 28,320. The issue on which the contest turned in 1890 was a purely State one, arising out of a controversy over the teaching of English in the schools; but the shrewdest Republican managers fear that some of their old allies among the Germans and other foreign-born voters who deserted them last year, will remain permanently in the Democratic party. However the Presidential contest may result, it is probable that the Democrats will secure the Legislature, and the United States Senatorship that goes with it, as they have a considerable majority among the holding-over members of the upper branch, and have redistricted the State so that the Republicans cannot reasonably hope to elect enough of their party to overcome this advantage.

Massachusetts continues to reap advantages from having a wide-awake Democrat in the Executive chair. Gov. Russell's latest service to the State is rendered in a message which he has sent to the Executive Council, protesting against the payment of an impudent claim for $14,000 which has been put in by one Davis for his alleged services as "legislative agent" of Massachusetts at Washington in securing the passage by Congress of the Direct-Tax Bill. The contract was made by the Republican Governor and Council a year ago, and if Mr. Brackett had been reëlected last fall, the bill would doubtless have been paid without any fuss about it. But Gov. Russell points out that the act of Congress refunding the tax itself provided "that no part of the money hereby appropriated shall be paid out by the Governor of any State or Territory or any other person to any attorney or agent, under any contract for services now existing or heretofore made between the representative of any State or Territory and any attorney or agent"; that if Davis really rendered any services, which is disputed, they must have been in the way of lobbying, and fall under the decision of the United States Supreme Court, in the case of Trist vs. Child, that such services were illegitimate, and, considered in connection with the pecuniary interest of the agent at stake, contrary to the plainest principles of public policy; and that the contract under which he was to be paid only in case of success falls within a decision of the Massachusetts Supreme Court, that "an agreement by which, in consideration that an attorney should prosecute suits in behalf of his client for certain sums of money, in which he had himself no previous interest, it was agreed that he should keep one-half of the amount recovered in case of success, and should receive nothing for his services in case of failure—is unlawful and void." In view of these facts, the Governor suggests that the Attorney-General be asked whether the contract is legally binding upon the Commonwealth, adding his own opinion that, "if said contract is illegal, because champertous, against public policy, or for other cause, I am of the opinion that the Commonwealth is under no obligation, moral or equitable, to recognize the claim of Mr. Davis."

Mayor Grant's last appointments are apparently much worse than the former ones, and still further confirm Mr. Hewitt's predictions as to Tammany's aims in taking charge of the city government. We have never in the history of New York had such a list of municipal officers as Mayor Grant has now given us. The appointment of "Barney" Martin as Commissioner of Jurors is a lower depth by far than was reached or attempted even under Tweed, and has a significance which will be perceived more clearly by and by than now. *It means the provision of better protection in the courts for Tammany office-holders and members of the Tammany committees than is now to be had, and better means of avenging or punishing the enemies and critics of Tammany than now exist.* It means the cessation of such interferences with the organization as the presentment of the Grand Jury against the Sheriff's office as administered by Grant, and as the indictment of the Excise Commissioners and of the ruffian Barker. It means, in short, a more efficient control by Tammany of the machinery of justice. It probably means, too, greater terrors for those who venture to expose or criticise the doings of the conspirators in the public press. It is, in fact, considering who and what "Barney" Martin is, and what the work he is now set to do, the boldest stroke Tammany has yet made.

We do not say all this by way of condemnation of the Mayor. In making these appointments he is simply exercising, in the way he was expected to exercise them, the permission and authority given him last fall by 146,000 voters of this city, out of a total registry of 244,970. Of these, 116,581, by voting directly for him, said in effect that he was the kind of Mayor they liked, and that they hoped he would give them, in his second term, the same kind of city officers he had given them in his first, and if possible worse ones. The remaining 30,000, by staying away from the polls, said, in effect, that they cared very little about city government; that, on the whole, they thought him a better Mayor than any other that offered, and did not object to his filling the public offices with his old "pals" and cronies.

The adjournment of the French Chambers over Easter without having taken definite action on the report of the Tariff Committee gave opportunity for an immense number of public and organized protests against the proposed new tariff. The *Journal des Économistes* has given up a great deal of space in its last two issues to the recording of such protests, and altogether they go far towards justifying Lord Salisbury's remark at the Associated Chambers of Commerce dinner, that in France the Government was more strongly protectionist than the people. Especially noteworthy is the action of the Lyons workingmen in joining their employers in protesting against a measure professedly designed to benefit the laboring men of France. The great silk-manufacturers and exporters put in their protest some time ago, but the protectionist orators said that the employees would take a different view. Another protest of real intellectual weight is that of various associations of writers and artists, who declare that the proposed narrow policy will lead to reprisals which will result in the injury of French literary and artistic producers. Sardou's name is signed for the Society of Dramatists. As showing a certain international solidarity of interest in the whole question, we note the resolutions adopted by the Consumers' League of Bordeaux, which, after vigorously protesting against the schemes of French "mac-kinléisme," "offered congratulations, in the person of the eminent ex-President Cleveland, to the free-traders of the United States, for the great victory won over American *mac-kinléisme* at the November elections."

The Clitheroe case, in which the Court of Appeal denied Mr. Jackson's right to compel his wife to live with him, is still the subject of fierce discussion in England. Mrs. Jackson is publishing in the newspapers, in self-defence, a history of her matrimonial life, which, however, contains nothing new, and the religious world is greatly excited over the decision, as in some manner, not clearly explained, weakening the marriage bond. The only serious result of it so far is the declaration of some justices of the peace that they will hereafter refuse, as useless, the separation order which the law now allows them to make on the application

of wives who charge their husbands with ill treatment or failure to support them. These justices say that as the wife, under the Jackson judgment, can leave her husband whenever she pleases, the trial of these applications would be now a mere farce. This has led to some very sharp remarks on the justices by the Lord Chancellor and Lord Esher, who shared in the judgment, at one of the non-judicial sittings in the House of Lords—an unprecedented occurrence, we believe. They said that they had nothing to do with the effect of their judgment on the separation orders, and that the observations of the justices were very unbecoming. If anybody is to blame in the matter, it is Parliament, which recently, by the "Weldon Act," deprived the courts of the power to enforce decrees for the "restitution of conjugal rights," by imprisonment, and failed to provide any other sanction, so that these decrees are now an empty form. Lord Esher remarked, sarcastically, that he never knew what "restitution of conjugal rights" meant, and had never met any one who did; but, whatever it meant, the Lord Chancellor and he, sitting in appeal, were quite satisfied that when the Legislature took away from the courts the power of punishing denial of conjugal rights with imprisonment, it never meant to hand the power over to the husband, and let him lock his wife up until she surrendered. If this state of things weakens the marriage bond, it is for Parliament to supply the remedy. The ferment the affair has excited is very curious, but hardly more curious than the English horror of marriage with a deceased wife's sister, approval of which by an Englishman many of the clergy look on as a sign of great moral weakness, on all sorts of subjects.

The London *Spectator* has an interesting article on "Sensational Trials," in which it gives a wonderful account of the interest excited by the Hurlbert case. It says that during the week in which it was going on "Mr. Hurlbert's conduct was discussed in clubs ten times as much as Mr. Quinton's. [Quinton was the British Commissioner killed in Manipur.] It is not too much to say that throughout London on Monday afternoon foreign affairs and Parliamentary disputes were alike forgotten, and that the single question on the tongue of all men, cultivated and uncultivated alike, was, 'How has the verdict gone?' nobody even stopping to explain about what verdict he inquired." It then goes on to show the greater sensationalism of such trials than of any novels that authors venture to write. "No popular writer in England would venture to depict a person such as Capt. Verney is charged with being, and will, we heartily hope, prove himself not to be; while the most daring of French or Russian analysts of secret crime would have hesitated before the surprise involved in Mr. Hurlbert's successful defence—that he once had in his service a secretary who personated him through months of evil adventure, wrote 150 letters in handwriting exactly like his employer's, and then vanished into the impenetrable cloudland of the United States."

No comment on the Hurlbert case is adequate, however, which does not treat the trial as a climax to his whole career in England. His defence was simply the crowning curiosity of his life in that country. We trust some biography—better than all, some autobiography—of him will yet be written, for it will be a very fascinating contribution to modern literature. He, an almost unknown foreigner, and without one of the usual guarantees of respectability from his own country, obtained in a year or two the hearty welcome of the most exclusive circles of London society, became a valued contributor to the English press, and finally a much-prized authority on the most burning question of British politics, and imposed himself on the *Spectator* as a pious American Catholic who was sickened by the sinfulness of his fellow-Catholics in Ireland. It was this immense success, accomplished through sheer force of social agreeableness and audacity, which prepared him for that wonderful *coup* which has so startled the British Isles, the invention of "Wilfrid Murray." He felt that he had his finger and thumb on the throat of the British chicken and could cram down anything he pleased. As a London authority on America, or professor of America, as we might say, he was the successful rival even of Squire Smalley, and poisoned the happiness of this personage by his still readier access to "great houses," where he was many times as amusing as the Squire, and vastly more improving in his conversation. We should think enterprising publishers would pursue Mr. Hurlbert night and day for a contract for a work entitled 'England as I Found It, and as It Found Me.'"

The scarcity of farm laborers, a phenomenon particularly noticeable throughout New England, and the crowding of cities with men almost starving for the want of work, do not appear to be confined to the United States. According to a writer in the *Nineteenth Century*, they exist in Australia, where the demand for labor to develop the immense agricultural resources of the country is very pressing. There, as here, a disproportionate growth of rural and urban populations has taken place. Australian laborers, like their American brethren, have a strong repugnance for life in the country, even with the assurance of plenty of work at good wages and an abundance of fresh air and light in their dwellings. "We saw the unemployed in Sydney," writes an agent of the English Emigration Society, giving a glimpse of this unattractive trait of Australian labor, "marching about by hundreds, . . . demanding of the Government six shillings a day without piecework, because to offer less would be, as they termed it, 'a degradation of labor,' . . . and many of them declining it because, when provided, it was a few miles up the country." The unfavorable reception in Australia of the proposed scheme of Baron Hirsch to assist Russian Jews to emigrate to that country was to have been expected. Australian labor regards with no favor any step that might increase the competition among its adherents. A few years ago it adopted the policy of exclusion, and so potent has it been at the polls and in legislatures because of the extent and thoroughness of its organization, that it has succeeded in enforcing its view. It has repealed the State-aid immigration laws; it has secured the adoption of other legislation shutting out the Chinese and the natives of the Pacific islands, so much needed to work on railroads and on sugar plantations in the tropical and subtropical parts of the continent, where the climate is so unfavorable to the European laborer that he sickens and often dies; it has, in fact, spread abroad unfounded reports as to the disadvantages of the country to people contemplating emigration. The consequence of this policy has been, as the author of an essay in the recently published work, 'A Plea for Liberty,' points out, the slow growth of population, and its actual decline in the mining and agricultural districts, steadily diminishing exports, and the neglect or decay of innumerable profitable employments.

It has all along been believed that the wild-cat financiering now so much in vogue in Brazil was mostly a private affair of the speculators, and that the administration of the public Treasury was conservative and safe. But late revelations go far towards destroying this confidence. The account published in the *Jornal do Commercio* of the excessive number of contracts and subventions entered into by the Minister of Agriculture and Public Works showed that, if they were all to be carried out, an amount of money would be called for equal to about eight times the entire annual revenue. Of course they will not all be carried out; some of the contracts have already lapsed or been cancelled, and more will be. Yet it gives a shock to public credit to find them even contemplated on such an enormous scale. Following this has come the revelation of some very questionable methods on the part of the Minister of Finance. He was charged with having quietly paid out the gold reserve that guarantees the Government paper currency, after the manner suggested as possible for Secretary Foster. This he denied, though in a highly ambiguous fashion, and in the face of a debt statement that seemed to warrant the charge. Whatever the merits of that controversy, Minister Barbosa has been simply overwhelmed in debate with a former Secretary of the Treasury. The latter has shown that the accounts passed over to the Treasurer of the Revolution by the Treasurer of the Empire have been completely fuddled by the former, so that an actual surplus of about $10,000,000 was converted into a deficit of $12,000,000. And the worst of it is that Barbosa has been forced to admit his blunder, saying that it was due to "a hasty reading of the figures."

A DECADE OF RAILWAY TRAVEL.

THE Census Bulletin giving comparative railway statistics for New England during the last decade suggests a number of points having economic importance. The growth of passenger travel is one of these. It appears that population in New England increased 17 per cent. from 1880 to 1889, and the length of railroad line 16 per cent.; the growth being nearly the same in both. Yet the number of passengers carried almost doubled (increase 98 per cent.) during this period. This greater use of railway facilities in 1889 than in 1880 is due primarily to the increase in suburban travel; more people, that is, live out of town and go daily into the city for business or pleasure. This fact is clearly brought out by another comparison: though the number of passengers increased 98 per cent., the number of miles travelled by all of them increased but 78 per cent., showing that the larger part of this increase was in short-distance journeys. Other census figures have shown us that our larger cities are growing faster than the smaller towns or villages; it is an important fact to remember in connection with this that there is also evident a movement of population from the more crowded portions of cities toward the suburbs. The shortening of the average railroad journey shows this better than the census, because city suburbs may be practically in the country although included within the municipal limits.

This growth of suburban travel may be more clearly brought out by some statistics of a Western road. From 1880 to 1889 the mileage of the Chicago and Northwestern Railway increased 91 per cent., and its passenger movement (miles travelled by passengers) but 99 per cent. Thus its passenger traffic has scarcely more than kept pace with its extensions; but the character of that traffic has changed completely, the increase in the number of individual travellers being 190 per cent. That is, had it not been for the suburban travel (in and out of Chicago principally), the Northwestern's traffic would have shown a comparative decrease. The same is true of other Western roads. The difference in the percentages of increase between New England and the States beyond Chicago indicates more than a growth in suburban population. It will be noticed that the increase in passenger traffic per mile of road in New England, 1889 over 1880, is about 55 per cent., while on the Northwestern it is only 4 per cent. This means that country people and villagers use the railways much more frequently in New England than at the West. No doubt the census statistician is right in ascribing this in a great measure to the manufacturing industries in New England, which encourage travelling on the part of operatives seeking or changing employment, and also on the part of salesmen and other business men connected with factories. Yet the fact that the number of individual travellers has increased during the decade six times more than population, seems fairly to allow the inference that persons living in the villages or large towns in New England are now taking more frequent trips to neighboring cities or to Boston or New York—in other words, that opportunities for general culture are more common and more generally availed of.

The railways west of Chicago find a different state of affairs. Many of their lines reach into sections hundreds of miles from any great centre. The struggle for existence is hard. Farming considered as a business requires but little travelling on the part of those engaged in it, and, as a matter of fact, agriculture, so important to the community at large, furnishes less freight and passengers to a railway in proportion to its general importance than mining or manufacturing. The villagers of New England travel for other purposes than merely the sale of produce or the purchase of supplies. In the April report of the Department of Agriculture the statistician ventures to prophesy. He says: "The proportion of agricultural labor will decrease, non-agricultural will increase, agricultural production will be more varied, rural intelligence and skill will advance, and the farmer be in better position to demand and secure an equitable share in the net proceeds of national industries." The falling off in rural population shown by the census may be accompanied by an increase of product per capita, and be therefore to a certain extent a sign of progress; yet until the farmers are in a position of comparative comfort and wealth, it is evident they will not afford to railways such an amount of passenger traffic as will be a source of much net profit.

The railway which is ambitious to increase its passenger receipts must, at least in the West, look first to the cities. The English railway manager Mr. Findlay, in his paper before the International Railway Congress at Paris in 1889, summed up his experience in these words: "As regards long distance traffic, I do not believe that the reduction of fares or any other concessions tend to materially increase the volume of business; as a rule, people do not take long journeys unless they have an actual necessity to do so, and in that case they will travel whatever the fare may be, within reasonable limits. Of course, this remark is not intended to apply to the traffic between large towns and seaside and other holiday resorts, this being a case in which, by judicious concessions, a traffic is created which could not otherwise exist."

All this seems to confirm the view that a compulsory reduction of passenger fares on the part of Western legislatures will not of itself induce a corresponding increase in the travelling of the farming class. A growth in passenger traffic must depend for the present upon other things, such as more diversified industry. If the farmers cannot yet take frequent trips to the city, it is the part of wisdom to induce the city residents, if possible, to live in the country. Through such an exchange our railways may increase their traffic, and at the same time rob the fact of our cities' disproportionate growth of some of the terrors with which alarmists have clothed it.

THE PROSPEROUS SOUTH.

THE statistics presented by the Superintendent of the Census in a late number of the *Manufacturers' Record* justify an economist's recent hyperbole, that the future situs of the principal iron production of the nation will be found within a radius of seventy-five miles from the topmost peak of the Great Smoky Mountains. They also show that King Cotton of ante-bellum days is a thing of the past: he now shares his sway on the plantations with a great diversity of crops, while he has begun a new kingdom among the factories and mills of the new South.

"Tens of thousands of acres in the Southern States that at one time produced a bale of cotton to the acre, are now covered with millions of vines, peach and pear trees, while trains and steamers for months in the year bear northward their burdens of vegetables and small fruits to supply the markets in States where ice and snow still hold sway." Moreover, the establishment of great industries, with consequent concentration of population and increase of wants, has created a new home market for a variety of crops and dairy produce. The total gain in value of the agricultural products of the South in 1889 over 1879 was upwards of two hundred and fifty millions, while during the same period the increase in value of live stock (including horses, mules, milch cows, oxen, sheep, and hogs) was nearly $178,000,000. A moderate estimate places the aggregate value of the agricultural products of this region in 1889 at $850,000,000.

But the industrial growth and outlook of the Southern States cannot be more concisely or graphically measured than by the production and handling of the three staples, cotton, iron, and coal; the last of these three is, indeed, an open sesame to the successful manufacture of the first two. "The fact that since 1865 nearly $8,000,000,000 have been brought into the South to pay for cotton, explains in part the marvellous recuperative powers of this section since the war." For many years three-fourths of the world's annual cotton crop (now about 11,000,000 bales) has come from the United States, but whereas, in 1880, the amount of cotton manufactured in the South was only 180,000 bales, in 1890 it had reached half a million bales, an increase in round numbers of 175 per cent., or about 8 per cent. of its product. In 1880 the twelve Southern States had only 156 cotton mills; last year they reported 366.

The South to-day is producing as much coal, iron ore, and pig iron as the whole country did twenty years ago. In the census year 1870 the bituminous-coal production of the Southern States was only 2,000,000 tons, that of the United States 15,000,000; in 1880 the output for the Southern States had risen to 5,676,160, in 1890 to 17,772,945 tons.

The quality of this Southern coal peculiarly adapts it for manufacturing purposes. Official reports of various comparative analyses of the Pennsylvania coke and the East Tennessee forty-six and seventy-two-hours' cokes show the superior quality of the

Tennessee coal for smelting iron ore, and for use in the various manufactures of steel in the Bessemer and open-hearth steel works. It has been asserted by many iron-makers that Southern iron ore could not compete in the manufacture of steel rails, etc., but competent experts reinforce the chemical analyses which prove that the magnetic iron ore of Tennessee "produces a metal not only fit for rails and the finest structural steel, but from which the finest cutlery has been and can be made." Mr. Porter states that enough of these high-grade ores exist in eastern Tennessee to supply the Southwest with steel and iron for a thousand years. Although previous to 1870 the mineral industries of the Southern States were almost *nil* (Tennessee being the only one in that year reporting any pig iron, and then less than 29,000 tons), while in 1880 their entire output of pig iron was short of 400,000 tons, in 1890 the production of iron ore in the nine iron-producing Southern States amounted to 2,917,529 tons, almost equal to the total production of the whole country in 1870.

Already, as a result of this wonderful mineral development, whole sections of country have been metamorphosed from agricultural to manufacturing districts, and we find an increase of urban population in several States of from 50 to 93 per cent. This revolution in social distribution—which it is the fashion to deplore regardless of the causes producing the change—has been a potent factor in educational advancement. With the phenomenal increase of taxable property incident to this concentration of population has come a gain in public-school enrolment enormously greater than the increase in population, with a correspondingly generous expenditure for educational needs. In Virginia alone between 1880 and 1890, while the per cent. of gain in population was only 9.48, the per cent. of gain in public-school enrolment was 55.06. It may be noted that with this advance in general educational facilities, the number of periodicals published at the South has increased over 65 per cent. The Census Bulletin on urban population contains hundreds of examples of small towns in Alabama, Georgia, Tennessee, Kentucky, North Carolina, and Virginia, which have, during the last decade, magically grown into centres of industry, intelligence, and thrift.

The railroad mileage of the South between 1880 and 1890 increased over 97 per cent., with a network of new roads being built and projected. The total assessed value of property in the nine States of Florida, Alabama, Mississippi, Louisiana, Texas, Arkansas, Tennessee, Kentucky, and West Virginia in 1880 was $2,913,436,095, in 1889 it was $4,220,166,400, being an increase during the ten years of $1,306,729,929; but the census authorities state that these figures represent only about "41 per cent. of the true value. . . . On this basis . . . there was a gain of over $3,000,000,000."

The advance of one section of the United States means a step forward for all. Southern progress stands for national growth, and, as such, appeals to the North as well as to the South; indeed, much of the industrial activity at the South revealed by the Eleventh Census would have been impossible without Northern capital, experience, and enterprise. That the people of the Southern States show a willingness to better their instruction, illustrates the power of recuperation and the capacity for social evolution always possessed by a sound and intelligent race.

BISMARCK'S TRANSFORMATION.

Prince Bismarck has at last been elected to the Reichstag on a second ballot for the constituency of Geestemünde, by a clear majority over his opponent, Herr Schmalfeldt, the Socialistic candidate. But the whole process has been very humiliating for him. It was very hard for such a magnate as he to have any opposition at all, when he announced his willingness to return to politics, in a country in which official greatness counts for so much as in Germany; but it was harder still to find that he could not on the first ballot get a majority of the votes. Even on the second ballot Herr Schmalfeldt has made a very respectable showing, for he has about 5,500 votes, against Bismarck's 10,500. Few would have believed, without seeing it, that Bismarck could have been induced to make such an attempt, and fewer still that, if made, it would not be immediately successful.

But his difficulty in getting into Parliament is not nearly as odd as his wish to get in. During his whole official life he has never lost an opportunity of repudiating the idea that he was or ever could be anybody's servant but the Crown's, and that he was or could be made accountable for anything he said or did to anybody but the Emperor, and that it was allowable for any man who had ever been a servant of the Crown to become, in any shape or form, a critic or opponent of the policy of the Government, in or out of Parliament. No one in Germany repelled so resolutely as he the notion that there was any analogy or resemblance between the Prussian parliamentary system and that of Great Britain, or that there could be such a thing in the German Parliament as a legitimate or loyal opposition headed by an ex-Minister. In truth, he punished several of his old colleagues—Eulenburg, Falk, Hobrecht, and Puttkamer, for instance—for acting on or even countenancing this theory.

No sooner, however, had he been precipitated into private life, and discovered that he was after all not a necessary man, and that the Empire had not to wait until his death in order to find out how to do without him, than he adopted the English system, apparently without the least hesitation. He has been for nearly a year pouring forth from his retreat at Friedrichsruhe a stream of criticism on the policy of the Emperor and his Ministers almost as trenchant and bitter as those of Mr. Gladstone or John Morley on the policy of the Ministry in England. But then these might have passed as the utterances of what is known to us as a "Sage," namely, a retired politician, living in the country at some little distance from a railroad station, and ready to converse on public affairs with all visitors, in the character simply of a somewhat despondent observer. Even this was thought very unbecoming; but everybody, from the Emperor down, was disposed to forgive much to a man whose fall from power and greatness had been so sudden and mortifying, and in whose breast both hope and ambition were dead.

It now turns out that he does not mean to be a Sage at all; that he has gone clear over to the English idea of parliamentary government; that he desires to reënter public life, as the leader of the Opposition, like Mr. Gladstone, and, like Mr. Gladstone, finds it quite possible to be a loyal subject of the Emperor, and even a loyal colonel of cavalry, while condemning all the plans and projects and ideas of the Ministry, and while in fact proclaiming his belief that they are leading the Empire, and even the social fabric itself, straight to ruin. No conversion from one school of politics to another so sudden and complete has happened in modern times. The Prince has gone over to the enemy with arms and baggage. There have been many cases since the French Revolution of the reconciliation of believers in divine right and strong military government to the theory of popular sovereignty and government by public opinion, but they have all, or at least all the conspicuous ones, been cases of reconciliation to the inevitable—cases of resignation to the Divine will while expecting the worst to happen. No one of Bismarck's standing has before not only adopted Liberal ideas, but deliberately undertaken to use Liberal instrumentalities in support of them.

That the effect on German politics of his appearance in the new rôle in the Reichstag will be very demoralizing, we may feel very sure. He will not figure very long as a leader of the Opposition without making terrible fissures in the old Prussian theory of personal government and royal sacredness. The young politicians will cease to dread the social discredit of opposition, and freer parliamentary speech will become common among even aspirants to office. The English idea that an organized and well-led opposition is an essential part of parliamentary institutions, and that there is no necessary connection between criticism of men in power and treason or sedition, will gain a firm foothold in German politics, and gradually transform the Government, as the young Emperor gets over the confidence in his own wisdom and capacity which is not unnatural at his age. To feel thoroughly the strangeness of all this, one has, however, to look at some of Bismarck's speeches during his quarrels with the Prussian Landtag between 1862 and 1866, when he was the pride and glory of Junkerdom.

A MISREPRESENTED RUIN.

Philadelphia, April 2, 1891.

About fifteen miles northwest of the ruins of Niffer, where we were excavating, is the ruin mound of Zibliyeh, marked on Kiepert's 'Ruinenfelder' as the "great ruins of Zibliyeh." It was readily visible from Niffer,

forming our landmark on the northern horizon beyond the shifting sand-hills. It was an object of special interest to us, for in his report to the Archæological Institute the director of the Wolfe Expedition had said: "Zibliye is not a large mound; but it possesses a conspicuous *ziggurat*, and no excavation has ever been made there." This meant, of course, an unexplored and unknown Babylonian city with a temple of the first class, possessing a *ziggurat*, or stage pyramid, in the corners of which inscribed cylinders of clay were probably waiting to reveal to the happy explorer who should dig them out the secret of the name and origin of this forgotten shrine and city. Loftus and Sir H. Rawlinson, to be sure, were inclined to refer these ruins to a later period, probably the Parthian, but they had been outvoted, so that in his 'Ancient Monarchies' even Canon Rawlinson, following especially Layard, notices Zibliyeh as an ancient Babylonian ruin.

During our first year's work we were not able to visit Zibliyeh, but in the second year I determined to make a special effort to examine a little more carefully than had hitherto been done such of the ruin mounds of Babylonia as were within my reach, with a view especially to determine the epoch to which they belonged, and also the prospects for excavation. Our permit did not allow me to undertake excavations outside of the area of ten square kilometres at and about Niffer, for the Turkish law concerning antiquities is a copy of the Greek law; but the Government does not forbid explorers to examine unknown sites to determine whether or not excavations are desirable. Zibliyeh lies in a desert and forlorn country, overblown with sand-hills; waterless, except for the stagnant pools which you find everywhere in the desert after rain; a no-man's land, the roaming ground of various tribes of wild Arabs. Moreover, between us and Zibliyeh lay, or was apt to lie (for territories there are vague and variable) the land of the es-Sa'id Arabs, some of whom professed to have a blood feud against me, which involved their shooting me on sight or my paying them blood-money, the preliminary payment asked for being $45. The Affej Arabs, having entered into a guarantee for my safety, could not afford to allow me to be shot or stolen, since in the event of my loss they would lose their present profits from the monopoly of my usufruct and their expected reward for my safeguard; and they might even get into trouble with the Government. On the other hand, they did not wish any complications with the es-Sa'id. So alarmed did they profess to be at the threats of some of the latter tribe against my life (I knew that they were really directed against my pocket) that I was always kept under the closest watch, and could not leave the camp for any purpose without finding myself attended by an escort of one or two Arabs armed with long old-fashioned flint-locks. Naturally they did not wish me to go to Zibliyeh, and sought to prevent, and actually did delay, my trip to that point by all sorts of trickery and many somewhat inconsistent stories.

It was towards the end of March when I said positively that I was going, guard or no guard. When it became clear to their minds that I would not be deterred, difficulties and dangers suddenly vanished. The brother of our chief, with a couple of his tribesmen, mounted, formed our escort. Two Arab workmen with pick and hoe trotted by our side, keeping easy pace with our horses. On our right were the sand hills, like waves of the sea, and almost as fluctuating. There is not so much sand as one might suppose from the map, but it blows back and forth over a large area. In our course, according to Kiepert's 'Ruinenfelder,' which is based on the British surveys of the district, should have lain the "great ruins of Chirzfûn." I did not hear that name, neither did I see any great ruins. Abu Jasim, also, which is marked on the map, I failed to find. Both going and coming we passed several fields and very low mounds of brick and pottery fragments; the nameless, village-like ruins which one encounters in such great numbers all over the country. Sometimes the traveller will ride for miles over a plain strewn with pottery fragments, and not see the slightest elevation to mark the site of former buildings.

I had hoped to be able to trace the course of the ancient Shatt-en-Nil, the canal river by which Babylon and Niffer once held communication; but about a quarter or half a mile from Niffer all traces of the canal bed seemed vanished, and I did not find them again before Zibliyeh, some of the mounds at which place seemed to me to be old canal banks, perhaps the banks of the Shatt-en-Nil, with some transverse canals. It must be remembered, by the way, that the beds, and not only the banks of the ancient canals, are higher than the level of the plain. Only the newer canals, or those which were dug out again in more recent times, exist as depressions in the surface. The Shatt-en-Nil, one of the greatest and most important ship canals of ancient Babylonia, has a very deep dry bed at Babylon, where it leaves the Euphrates; and at Warka, ancient Erech, where it rejoins that stream, it is still deep enough to be full of water in the spring and early summer, as I found later by experience; but at intervening points I have found it as two lines of mounds, the space between which was elevated a yard or so above the surrounding plain.

Zibliyeh was a great disappointment. There is one prominent mound, the *ziggurat* of Layard and Ward, and a few low, insignificant mounds around it. Loftus says that the main mound is fifty feet high and forty-four paces square. It is hard to tell just where to measure it. I set the central or erect portion down as about thirty feet high, seventy-five feet long, and fifty feet broad. Two of the corners point approximately north and south. A very brief examination served to show that we had to do with no *ziggurat*, nor even with a ruin of the Babylonian period. On the northeast and southwest faces, where the mound had been much washed away, the ends of two several vaults of masonry are exposed to view, one of which served, at the occasion of our visit, for a hyena's den. Evidently, therefore, this was no solid terrace, like those which constitute the stages of a *ziggurat*. A very little scraping on the top of the mound revealed a structure of brick and plaster, resting on these vaults as a substructure. They, again, rested on a mound or terrace, apparently of rubble or clay, faced with a solid, thick wall of unbaked brick. This wall was carried up all around, either for defence or as an enclosure, to a point higher than the vaults, but lower than the top of the brick-and-plaster structure which was built upon those vaults. On the northeastern side, half way up, I found a small, shallow piece of brick wall at right angles to the outer walls, looking as though the entrance to the building above were by an ascent, either steps or an inclined plane, over the unbaked brick walls at this point, like the entrance to the famous Assyrian palace of Sargon at Khorsabad, but on a very small scale. On the top of the mound we found a rough plaster moulding and a part of a small half column of the same material. A piece of a similar half column was found at the foot of the mound. The baked bricks were of poor work, yellowish without and greenish within, coarse, uneven, and brittle. They were set in a profusion of mortar. The unbaked bricks, also, were of inferior quality, the clay little worked, full of air, and not well compressed, so that they crumble away and dissolve very readily, unlike the bricks of the good Babylonian periods. The straw with which the clay had been mixed to make the bricks was remarkably preserved; so that on breaking them you find not merely the mould of the straw in the clay, but the straw itself. Between each layer of bricks was a layer of reeds. These also were remarkably well preserved, and often where the bricks had been washed away you could see the reeds projecting so far that they waved and rustled in the wind. Outside of the ruins of this castle there is nothing of any importance at Zibliyeh—merely a few irregular, low, small mounds, some of them probably canal mounds, and fragments of brick and pottery scattered over the flat surface of the plain.

From what I saw I do not think that Zibliyeh could possibly be older than the Parthian period, where Loftus places it, while it might be much younger. The Arabs thereabouts say that it was built by an Arab king as a place from which to signal to bring his adherents together in case of a raid. Such native Arab stories of the origin and purpose of the ruins of the desert are ordinarily of no value whatever. In this case the present practice of the Bedouin has given rise to the story. Zibliyeh, Niffer, and similar ruin mounds are the only elevations, and, consequently, the natural watch-towers and signal stations of the country. On occasion of a threatened raid of the Shammar I have seen the top of the Bint-el-Amir, the *ziggurat* of the temple of Bel at Niffer, used as the station from which to warn the es-Sa'id and the Affej of the movements of the supposed marauders. The signal flag was nothing but an *aba*, the common Arabic cloak.

Zibliyeh may have been a castle to control a canal centre. This may also have been the object of the famous ruin of Akerkuf, near Babylon, the centre of the most remarkable network of canals that I saw in all Babylonia; only Akerkuf was, I judge, both more important and far older than Zibliyeh. Layard's error in describing Zibliyeh as an old Babylonian *ziggurat* ('Nineveh and Babylon,' p. 569) is readily explained and pardoned when it is remembered that he was returning, seriously ill and almost unable to sit his horse, from his bootless attempt to excavate Niffer, and took refuge on the summit of this mound, as the only visible place of defence against a hostile-looking troop of Arabs. He was not in a condition to observe for himself, but was compelled to trust to the eyes of others, who in their turn were too excited and hurried to observe correctly.

We were able to stay at Zibliyeh only about two hours, because, through a blunder, we found ourselves very inadequately supplied with water, and the men became useless and uncontrollable when suffering from thirst. Two Rufe'a Arabs came to Zibliyeh in search of water, because their camp had consumed the stagnant pool on which they had been depending, and must find another pool. Such is their life, and it is almost incredible on how little and how vile water they subsist. If their horses, camels, sheep, and asses can drink it, that is enough. Neither do they always encamp near

water, for I have seen a large camp situated at a distance of almost ten miles from water, while a distance of three or four miles is not infrequent. Water is needed chiefly for the animals, and they can be driven some miles to water, pasturing on the way back and forth. Their wants satisfied, little water is needed in camp, only enough for cooking, making coffee, and sometimes mixing with *lebben*, the soured or fermented milk of sheep or camels. No water was visible from Zibliyeh, and we knew of the existence of none nearer than the upper end of our own marshes, some nine or ten miles away, for the swamp of Abu Semak (father of fish) of Kiepert no longer exists. Accordingly about noon we were compelled to go in search of the Ruf'ea camp, which we found two or three miles away to the northeast. The Rufe'a had no water, but provided us liberally with *lebben*. It seemed useless to return to Zibliyeh, and all the men were strongly against it, so we went back to Niffer directly by a route further east than the one by which we had come in the morning.

I have ventured to enter into the narrative of this day's work somewhat fully because it illustrates very well the conditions of work in Mesopotamia, its difficulties, and the unsatisfactory and meagre knowledge of the country which we possess even in its best-explored parts; and I have described the ruins of Zibliyeh themselves at some length because, unimportant and comparatively modern as they actually are, they have been classed as important ruins, the remains of a great temple, and therefore presumably also of a great city, in the ancient Babylonian period.

JOHN P. PETERS.

Correspondence.

THE MOST-FAVORED-NATION CLAUSE AND RECIPROCITY.

TO THE EDITOR OF THE NATION:

SIR: The *Nation* of the 23d inst., in an editorial discussion of the reciprocity treaty with Spain, uses the following language:

"If Spain's treaty engagements with Great Britain, France, and Germany, or either of them, contain the 'most favored nation' clause, and if this clause applies to her colonies, she will be compelled to extend to them the same treatment as to ourselves. This would prevent us from gaining any advantage over other countries in the sale of articles, either raw or manufactured, unless we have a natural advantage."

This statement seems to be founded upon a misapprehension of the force and effect of the "most favored nation" clause in commercial treaties. If it were true that a reciprocal agreement with Spain to admit her sugar free of duty in exchange for a like favor on her part in respect of American products, carried with it the obligation that each of the contracting parties should place on the same footing all countries with which it had a "most favored nation" treaty, there would be an end to reciprocity treaties. The United States now have treaties with upwards of thirty States in which the "most favored nation" clause is to be found in one form or another, and if the statement quoted from the *Nation* be correct, our Government would be bound to extend to every one of these States the same privileges accorded to Hawaii, Brazil, or Spain under the reciprocity treaties with those nations. But, fortunately, no such obligation rests on either of the contracting Powers. It has been from our earliest diplomatic history the contention of our Government that the "most favored nation" clause has no application to privileges granted on the consideration of reciprocal advantage, but only to privileges granted gratuitously, and in this decision other Governments have generally acquiesced.

The question seems to have first arisen with reference to the treaty with France in 1803, by the eighth article of which it was agreed that the ships of France should "be treated upon the footing of the most favored nations" in the ports of the territory ceded to the United States by that treaty. France claimed that special favors had been granted to English ships to which French ships, under this article, were equally entitled. The United States replied that the favors granted to English ships were in accordance with a reciprocal agreement and were not gratuitous, and that therefore France had no claim to equal favors under the article cited. From this position our Government declined to recede, and France abandoned the claim in the treaty of 1831.

The same position was taken by Mr. Evarts, then Secretary of State, with regard to the effect of the reciprocity treaty with Hawaii. Other nations having treaties with Hawaii containing the "most favored nation" clause, particularly Germany and Great Britain, sought to claim from the Hawaiian Government the same privileges granted to the United States. Our Government protested against any concession to this claim as impairing the obligations of the treaty of reciprocity, and in this view the Hawaiian Government concurred.

Curiously enough, however, it appears that the Spanish Government entertained in 1884, when a reciprocity treaty with the United States was under discussion, the same views as those expressed in the *Nation*, and assigned as an objection to such a treaty the existence of the "most favored nation" clause in the treaties of Spain with other nations. To this objection Mr. Frelinghuysen replied that—

"This Government has always assumed that Spain held the same views as ourselves respecting the effect of a reciprocity treaty in connection with the most-favored-nation clause in other treaties. This country has that clause in many of its compacts with foreign States, but it has never occurred to them or to us to suppose that we were thereby constrained to grant to those treaty Powers without equivalent the privileges which we had by special engagements stipulated to concede to countries like Hawaii and Canada, for a valuable consideration."

It is safe to presume that in the present case the doubts of Spain have been resolved upon this point, and that she does not hold herself bound to give to one nation what she has sold to another.

There has also been a judicial determination of the question in favor of the view above set forth. Importers of sugar from the Danish West Indies claimed, under the "most favored nation" clause of the treaty between Denmark and the United States, the same privileges as were accorded to Hawaii under the reciprocity treaty with that country, and, having paid the usual duty under protest, brought suit for its recovery. Mr. Justice Field, speaking for the Supreme Court, said: "Our conclusion is that the treaty with Denmark does not bind the United States to extend to that country, without compensation, privileges which they have conceded to the Hawaiian Islands in exchange for valuable concessions" (Bartram vs. Robertson, 122 U. S., 116).

It is not uncommon in the later treaties expressly to stipulate that the "most favored nation" clause shall not be deemed to extend to concessions granted to other nations upon the consideration of reciprocal privileges. But, as Mr. Bayard, when Secretary of State, pointed out, "this proviso, when it occurs, is merely explanatory, inserted out of abundant caution. Its absence does not impair the rule of international law that such concessions are only gratuitous (and so transferable) as to third parties when not based on reciprocity or mutually reserved interests between the contracting parties. This ground has been long and consistently maintained by the United States."

E. W. HUFFCUT.

INDIANA UNIVERSITY LAW SCHOOL, April 27, 1891.

WASHINGTON AND ROADES CONNECTION.

TO THE EDITOR OF THE NATION:

SIR: Referring to Mr. Moncure D. Conway's interesting article on the "English Ancestry of Washington" in the number of *Harper's Magazine* for May, I am forced to say that Mr. Conway unduly degrades, to modern ears, the President's supposed ancestor, John Roades, bailiff to Sir Edmund Verney, by calling him a "farm servant" (p. 884), as at present the term "servant" is generally held equivalent to menial. A bailiff was not a menial; on the contrary, he was the manager, often the *de-facto* master, of an estate, having under him the farm servants and menials; in fact, he was the equivalent of our overseer or agent. As stated above, the term "servant" is, at present, held in ordinary estimation but equivalent to "menial." This was not so in the seventeenth century; then a nobleman might be called a servant to the king, a gentleman the servant of a titled personage, without loss of dignity. And so it was with these Roadeses: they were gentlemen, or, at least, yeomen, serving a knight (not mere farm servants), as the official documents referred to by Mr. Waters, in his 'Ancestry of Washington,' reprinted from the *N. E. Historical and Genealogical Register* for October, 1889, show; William Roades being distinctly styled "gen." (pp. 8 and 10), that is, *generosus*, gentleman *born*, from which we may infer that his father (supposed to have been John Roades) was also a gentleman, otherwise his son could not have been one by birth. Moreover, the good standing of this family of Roades is shown by its connection with that of Fitzherbert; Elizabeth Roades, apparently the sister of Amphillis Roades (Mrs. Washington), having married Edward Fitzherbert.

At the same time, no doubt, these Roadeses were not on a par with the Washingtons; hence the match, likely enough, was considered somewhat of a misalliance, but not a social degradation as may be inferred from the modern understanding of the term "servant."

MAY 1, 1891.

THE VERB *DEMEAN*, 'DEBASE.'

TO THE EDITOR OF THE NATION:

SIR: There being nowhere, it appears, anything like a full discussion of this word, I shall attempt to supply, in some slight measure, the deficiency.

By the side of *demean*, *demeanour*, we have the *demean* with which I am occupied; "really the same word," Prof. Skeat dogmatizes, "but altered in sense, owing to an obvious (but absurd) popular etymology." Its constituents, the Latin preposition *de* and the English adjective *mean*, are here referred to. Yet why, if we chose, were we not to have, made up of those constituents, a factitive *demean*, classifi-

able with *deprave?* Whatever adverse reasons, or pretexts for reasons, are allegeable, this *demean* confronts us as an actual fact. Instead, therefore, of being "really the same word" as the old *demean*, it is wholly different, save partly as respects its first syllable. And again, its origination was sufficiently respectable. It is a hybrid, certainly; but of that character are *debar*, *defile*, *detach*, the outworn *defoul*, and the American *derail*, to go no farther. Accordingly, to stigmatize its etymology as "absurd" is, itself, something like what is, with popular laxity, called an absurdity. It is on historical grounds that I base my dissent from those who are satisfied with Prof. Skeat's otiose method of accounting for the modern *demean*. When this word emerged, the old *demean*, used reflexively, was in full vigor; and no one has offered to prove that *demean oneself well* was, in any age, less common than *demean onese'f ill*. Why, then, should this *demean* have had the idea of debasement attached to it? As far as I can conjecture, on the view which I am combating, *demean oneself ill* must, at one period, have been so much more current than *demean oneself well*, that sciolists thought themselves justified in doing away with its *ill*, as being pleonastic. And, especially, such sciolists must have achieved a notable exploit in reviving, with a new sense, the old transitive *demean*, 'conduct,' which, in all likelihood, had been, for some two generations, hardly better than obsolete. For, on the showing of the quotations about to be exhibited, *demean another*, 'debase another,' which, theoretically, precedes *demean oneself*, 'debase oneself,' does not figure, practically, as the later innovation of the two. So much for the genesis of the modern *demean*. Whether it is yet legitimated by an adequate consensus of good writers is a question by itself.

Dr. Murray and Mr. Henry Bradley, of the *Philological Society's Dictionary*, have been so obliging, in connexion with the term I am investigating, as to furnish me, the one with a quotation, at first sight seemingly of great interest, and the other with the Latin which it is designed to render. Caxton, in one of his translations, the *Golden Legende*, printed in 1483, writes that St. Stephen "was . . . *demened* and beten." But this, it turns out, stands for "feriebatur & *perducebatur*"; and hence, since "demened" is one with 'led forth,' the idea suggested by its context, that it might signify 'debased,' is at once dissipated. On the plea of their being misunderstood, we may also confidently set aside the passages from Spenser and Bp. Robert Abbot (1601) which Archdeacon Todd brings forward, under the transitive *demean*, as having the import of 'debase,' or one closely allied to it. As to the quotations from Dean Swift (1733) and Benjamin Franklin (1788), the only oldish ones that I have seen adduced, their relevance is unquestionable; but, that many still earlier than the first of those which follow will come to light, may reasonably be presumed:

"By it [jealousy] we *demean* the Person we love, through unworthy Suspicion." Mrs. Jane Barker, *Exilius* (1715), Part I., p. 59.

"The whole subject [is] disoblig'd, if not quash'd; the Author *demean'd*, if not actively and passively ridicul'd." Myles Davies, *Athenae Britannicae*, Part II. (1716), p. 149.

"As to affectation in general, we shall hereafter give some instances how all kinds of it *demean* and render trifling the persons who are guilty of it." Mrs. Eliza Heywood (1745), *Female Spectator* (ed. 1748), vol. iii., p. 191.

"Zadock . . . now stood behind his back, and would not *demean* the Briton so much as to wait upon any person but his laird." William Toldervy, *History of Two Orphans* (1756), vol. iv., p. 29.

"Let Swift be Swift, nor e'er *demean* The sense and humour of the Dean." Robert Lloyd (1762), *Poetical Works* (1774), vol. ii., p. 35.

"Look *up* to thy daughter, good Simon? Alas, no! The Captain of Clan Quhele, great as he is, and greater as he soon expects to be, looks *down* to the daughter of the Perth burgess, and considers himself *demeaned* in doing so." Sir Walter Scott, *Fair Maid of Perth* (1828), chap. xxvii.

"These particular individuals . . . had met, from those to whom they *demeaned* themselves, that return which their time-serving and disloyalty had deserved." Rev. Dr. Christopher Wordsworth, *King Charles the First*, etc. (1828), p. 244.

"Even Sir Isaac shall not be *demeaned* by mercenary tricks." Lord Lytton, *What will he do with it?* (1858), vol. i., p. 401 (ed. 1859).

"Besides, she lays traps to *demean* me, set me to work like a clerk!" *Id.*, *ibid.*, vol. ii., p. 114.

"The party which bears on its banner the Cross and the name of God must not *demean* its high mission by any narrow-hearted squirearchical selfishness." *Saturday Review* (1856), vol. ii., p. 37.

"If the Master be a fit man for his office, methinks he will sometimes sit down sociably among them; for there is an elbow chair by the fireside, which it would not *demean* his dignity to fill, since it was occupied by King James at the great festival of nearly three centuries ago." Mr. Nathaniel Hawthorne, *Our Old Home* (1863), p. 98 (ed. 1864).

Dr. Johnson, whose fancy still misleads Dr. Webster's editors, thought that he had lighted on an instance of the verb under notice, used reflexively, in Shakespeare's *Comedy of Errors;* and, though, among his editors, Archdeacon Todd was, and quite warrantably, of a contrary opinion, Dr. Latham has since tacitly subscribed to the original misapprehension. At the same time, Dr. Latham omits the only other quotation which the Archdeacon gives for the reflexive *demean*, namely, from Dr. Doddridge, and, consequently, leaves it absolutely unexemplified. Nor is any author vouched for it by Dr. Richardson, little to his credit. The proofs of its frequent occurrence which will be produced may, therefore, be acceptable to the curious.

Before producing these proofs, however, I must transcribe and scrutinize a passage from the Rev. Dr. Peter Heylyn:

"For Athanasius tells us, that hee [George] had before beene made a Priest, and that he so *demeaned* himselfe in that holy Calling, that he was forthwith deposed from the Ministery." *Historie of St. George of Cappadocia* (1631), p. 106.

On most occasions, and, perhaps, above all, when he is minded to be calumnious or brutal, Dr. Heylyn is explicit enough, even to superabundance. For instance, this precious vessel of sanctitude and savagery records the wish, in one of his diatribes, that a learned fellow-cleric, Henry Burton, had lived in days when his tongue would have been "cut out." There is no ambiguity here; and it must be that, in writing, as above, "*demeaned* himselfe," which represents διὰ τὴν κακίαν αὐτοῦ, he took it for granted that the contextual "he was forthwith deposed," etc., could leave no room for doubt that George's behaviour, though designated by a term ethically neutral, was ill behaviour. Only in defiance of historical probability, I conceive, can Heylyn, any more than Spenser, Shakespeare, and Bp. Robert Abbot, be appealed to as employing the old *demean* dyslogistically.

But, despite the poverty of pertinent illustration observable in dictionaries, the reflexive *demean*, from *de* and *mean*, abounds in later literature, as the quotations given below will be seen to establish:

"I would not be understood, that Men of Honour and Estate should *demean* themselves by base condescension." Anon., *Miscellany Letters from Mist's Journal* (1720), vol. i., p. 306 (ed. 1722).

"I could make you sensible that you ought to have been asham'd, long ago, of standing in need of the Interposition of the House of Commons, to prevent you from *demeaning* yourselves so much as to wear so uncostly a Dress as Callico." Bartholomew Paman (1723), *Briton* (1724), p. 28.

"To write she thought would be *demeaning* herself too much, and might make him rather despise than love her." Mrs. Eliza Heywood (1744), *Female Spectator* (ed. 1748), vol. i., p. 254. Also in vol i., p. 228; vol. ii., pp. 48, 277; vol. iii., p. 186; vol. iv., p. 137. And *id.*, *History of Miss Betsy Thoughtless* (1751), vol. i., p. 204.

"A woman is looked upon as *demeaning* herself, if she gains a maintenance by her needle, or by domestic attendance on a superior." Samuel Richardson, *Sir Charles Grandison* (1754), vol. iv., p. 154 (ed. 1811).

"I shall not *demean* myself so much as to tell you who I am." Mrs. Charlotte Lennox, *Henrietta* (1758), vol. i., p. 3 (ed. 1761).

"When Mrs. Catharines rose, she found me busied in the basest employments of the kitchen. She looked astonished. 'Why, my dear,' she cried, 'would you *demean* yourself in this manner?'" Henry Brooke, *Fool of Quality* (1760-72), vol. iii., p. 167 (ed. 1792).

"I think I cannot much *demean* myself by an alliance with a sweet fellow whom I so ardently love." *Id.*, *ibid.*, vol. v., p. 207.

"Have I, sirrah, *demean'd* myself to wed such a thing, such a reptile as thee!" Foote, *Mayor of Garratt* (1763), Act ii, Scene ii.

"Oh Madam, how can you *demean*, as I may say, undervalue [yourself]—" *Id.*, *Patron* (1764), Act ii., Scene i.

"Hold, gentle princess, said Theodore, nor *demean* thyself before a poor and friendless young man." Horace Walpole, *Castle of Otranto* (1764), Ch. iii., in *British Novelists* (1820), vol. xxii., p. 260.

"Mr. Heidelberg lost his election for member of parliament, because I would not *demean* myself to be slobbered about by drunken shoemakers, beastly cheesemongers, and greasy butchers and tallow-chandlers." Colman and Garrick, *Clandestine Marriage* (1766), Act iii., Scene ii.

"This lesser philosophy engagingly *demeans* itself to all characters and situations." Coriat Junior (Samuel Paterson), *Another Traveller!* (1767), vol. i., p. 427.

"It abates my veneration, when I see a man descend from the seat of authority, and *demean* himself to the employment of weighing out a quarter of the worst bohea." Anon., *Life and Adventures of Sir Bartholomew Sapskull, Baronet* (1768), vol. i, p. 207.

"He persisted, therefore, inflexibly in the resolution not to *demean* himself by begging suffrages in the low, abject manner common at that time." Goldsmith, *Grecian History* (1774), vol. i, p. 379.

"Is it likely she will permit her favourite nephew to *demean* himself by so unequal an alliance?" Anon., *Trinket* (1774), p. 52.

"I won't *demean* myself by naming what you are." Sheridan, *Duenna* (1775), Act i., Scene iii.

"The page pulled me by the sleeve, and whispered me that I should *demain* [*sic*] myself in all mens eyes, was I to discourse with such folks." Anon., *Minor* (1787), p. 220.

"To mix in so low a conspiracy, and *demean* himself by the adoption of such illiberal arts." William Roberts, *Looker-on* (1793), vol. ii., p. 197 (ed. 1794).

"The learned and excellent men . . . are not accustomed to *demean* themselves so far as to judge of works so much below their notice as this." Dr. Charles Burney, *Memoirs of Metastasio* (1796), vol. i., p. 26.

"Mrs. Persian, lamenting that she . . . should have *demeaned* herself so much as to wait on the niece of a simple knight," etc. Mrs. A. M. Bennett, *Beggar Girl and her Benefactors* (1797), vol. v., p. 239 (ed. 1813).

"As if divided between the agreeable triumph of showing her activity and usefulness, and the dread of being thought to *demean* herself by such an office." Miss Jane Austen, *Mansfield Park* (1814), p. 342 (ed. 1866).

"To what indignity, Heated with rage, would I *demean* myself!" Charles Lloyd, *Translation of Alfieri* (1815), vol. ii., p. 46.

"Not that they ever beat or struck the boys: that would have been to have *demeaned* themselves," etc. Charles Lamb (1818), *Prose Works* (ed. 1838), vol i., p. 89.

"He sometimes *demeans* himself by condescending to what may be considered as

bordering too much upon buffoonery," etc. William Hazlitt (1818), *Political Essays* (1819), p. 362.

"My only doubt was, whether I should *demean* myself so far as to implore his intercession." Thomas Hope, *Anastasius* (1819), vol. i., p. 118 (ed. 1827).

"'Master Smith may fill for himself, if he wishes for liquor,' answered the youthful Celt. 'The son of my father has *demeaned* himself enough, already, for one evening.'" Sir Walter Scott, *Fair Maid of Perth* (1828), chap. ii.

"I never saw a Merry Andrew that I did not feel ashamed that a man should *demean* himself by taking such a part." Rev. F. E. Paget, *Tales of the Village Children*, second series (1844), p. 41 (ed. 1858). Mr. Paget, in his *Milford Malvoisin* (1842), p. 35, puts "I shall not *demean* myself," etc., into the mouth of an imaginary speaker in 1643. Herein, so far as appears, he anachronizes; and so does Sir Walter Scott, in the two quotations which I have taken from him.

"I had even the necessity to *demean* myself by a blow with the naked hand." Lord Lytton, *Caxtons* (1849), vol. iii., p. 92. And so very often in Lord Lytton's works.

"No, Major Pendennis would on no account have his nephew appear like an apothecary; the august representative of the house of Pendennis must not so *demean* himself." Mr. W. M. Thackeray, *Pendennis* (1849-50), ch. lxi. Many like quotations from Mr. Thackeray are at hand.

"The growl of indignation at Jack's so *demeaning* himself would probably not be appeased," etc. Mr. A. J. B. Hope, in *Cambridge Essays* (1858), p. 8.

"I admit that I am a spy, and that it is considered a discreditable station, though it must be filled by somebody; but this gentleman is no spy, and why should he so *demean* himself as to make himself one?" Mr. Charles Dickens, *Tale of Two Cities* (1859), p 176 (ed. 1868).

"They would not *demean* themselves to submit to this sort of paltry tutelage." *Saturday Review* (1861), vol. xii., p. 551.

"But who would suspect the Board of Works of *demeaning* itself to ask an architect's advice on such a trifle as the pageantry of a national wedding?" *Ibid.* (1863), vol. xv., p. 368.

"It is not to be thought of that a youth . . . should *demean* himself by marrying," etc. London *Daily News*, leading article, Aug. 8, 1890, p. 5, col. 2.

Dr. Murray, my indebtedness to whom I have already acknowledged, has kindly communicated to me a number of quotations, kindred to the foregoing, which I have not availed myself of; those that have been given, all of them collected by myself, being amply enough to serve my purpose.

Dr. W. B. Hodgson, in his *Errors in the Use of English* (1881), cites, for *demean*, 'debase,' with other authorities, the Rev. Sydney Smith, the *Quarterly Review*, and the London *Times*. But his quotation from Dr. Johnson, "he would have *demeaned* himself strangely, had he," etc., as reported by Boswell, is far from being conclusively in point; since it is not at all obvious that "demeaned" may not there be synonymous with "conducted." Moreover, we have nothing approaching assurance that Dr. Johnson said "demeaned." Again and again, it may strongly be suspected, Boswell fathers on him expressions which he would have stoutly repudiated. "Catched," "serieses," "*of* consequence" for "*by* consequence," "he *confesses to* one bottle of port every day," and "let you and *I*, sir, go together," can hardly have fallen from Dr. Johnson's lips, though, if we are to trust his biographer, they did.

An interesting instance of self-criticism now demands to be noticed. Lord Macaulay, in his essay entitled "Lord Burghley's Life and Times," published in the *Edinburgh Review* for 1832, writes that "Cecil so *demeaned* himself as to avoid," etc., instead of which is found, in his collected *Essays*, "Cecil so *bemeaned* himself as to avoid," etc. That "demeaned" was designed to be understood pejoratively is evident from the later substitute for it; and it is likewise evident that Lord Macaulay must have come to object emphatically to it, or he would not have displaced it in favour of "bemeaned." To his thinking, probably, *debased* would imply greater disparagement than he deemed to be merited. At the same time, it was very unlike him, with his fastidious taste, to sanction a word so unusual as *bemean*. For unusual it is, though the quotations authorizing it which I have by me are twice as many as those given by Dr. Murray, whose quotations from Gataker, by the by, should be dismissed. See, for reasons, my *Recent Exemplifications of False Philology*. To what is there urged I may add that Gataker has not a syllable about Ridley's debasing himself, when Bishop of London; and history is silent as to his having done so. Furthermore, the edition of the *Abel Redevivus* (*sic*), from which the passage under comment is derived, swarms with typographical errors of every description.

In Charles Dibdin's *Waterman* (1774), Act ii, Scene i, a woman not only says, "I won't *bemean* myself by repeating his filthy name," but speaks approvingly of "people that know how to *bemean* themselves." Whether the speaker, Mrs. Bundle, is not to be taken, in her *bemean*, "comport," as simply malapropizing, after her wont, may be questionable.

Critics who arraign the usage with which this letter is mainly concerned are not a few. The pronouncements, in part or in full, of three of them—the latest noticeable for its ineptitude, and the others quoted from books seldom met with—here follow:

"*Demean.* This word is used by all the lower people, as well as by great numbers of their betters, to signify 'debase' or 'lessen.' It is also found in the same sense in bad writers. Richardson often [!] presents his readers with it in his emetic history of Pamela. Nay, if I mistake not, I have met with it, once or twice, in Swift; and I think it likewise once occurs in my Lord Bolingbroke's 'Oldcastle's Remarks upon English History.' If these two writers have really employed the word in that sense, it must undoubtedly have been through oversight. They could never be ignorant that *to demean* signifies 'to behave, to comport,' and not 'to debase' or 'lessen,'

"What causes the mistake in so many persons is the syllable *mean*. The word *mean*, signifying 'low' and 'contemptible,' and the word *meanness*, 'lowness,' they imagine, from thence, that *to demean* must signify 'to make contemptible,' or 'cast a meanness upon.'

"As to the substantive *demeanour*, it is a word the lower people are not acquainted with. If they were once to get hold on it, I make no doubt they would misapply it as much as they do the verb." Robert Baker, *Remarks on the English Language* (1770), p. 5 (ed. 1779).

"*Demean himself.* When the Illiterate are desirous of 'talking fine,' they use *demean himself*, instead of their accustomed Phrase, *let himself down*.

"The French, *demener*, means 'to conduct or behave.' It relates to Deportment, and never indicates Disgrace or Dishonor. The Vulgar use also *bemean*: 'He *bemeans* himself by such Conduct.'" Rev. Dr. Philip Withers, *Aristarchus* (1791), p. 208.

"*Demean.* This word is often used in the sense of 'debase'; a blunder which has no better apology for its existence than the fact that the second syllable of the word, when separated from the first, signifies something akin to 'debasement'; just as the second syllable of *deride*, when separated from the first, signifies 'taking a ride'! Or, again, which is more immediately applicable, as *meaning* might be used in the place of *grovelling*.

"The verb *demean* and the noun *demeanour* have a common signification; 'to behave, to conduct,' well or ill; 'behaviour, conduct,' good or bad.

"If an educated man were to set about attaching a new meaning to the verb, he would see the necessity of attaching a cognate meaning to the noun. If he made *demean* signify 'debase,' he must make *demeanour* signify 'debasement,' or 'base conduct'; the absurdity of which is, or should be, sufficient to dispose of the question." Mr. Edward S. Gould, *Good English* (1867), p. 44 (revised edition, 1880).

Baker little knew how largely the object of his scorn had won acceptance with authors of reputation; and Withers was, to all appearance, equally uninformed on that point, and also with regard to the respectability of *bemean*. As to Mr. Gould, his talk about "a blunder," with all the rest that he says, is quite of a piece with his ordinary lack of judgment in philologizing. Since he refuses to recognize that we have, whether acceptably or not, two verbs *demean*, his argument about giving a new sense to *demeanour* is inconsequent and nugacious. Imitating speculation of his stamp, we should ignore that the homonyms *defer*, 'postpone,' and *defer*, 'submit oneself,' have descended to us, respectively, from *differre* and *deferre;* we should see, in what are, undeniably, two verbs, only one verb, with a twofold meaning, and the later of them "a blunder"; and if we discovered that the *defer* corresponding to *deferre*, with its attendant substantive and adjective, came into our language first, we should be obliged, in case we endured *defer*, 'postpone,' to contend that *deference* and *deferential* ought to denote, in addition to their earlier significations, 'postponement,' and 'pertaining to postponement.' No more in dealing with words than in dealing with other things is it permissible to shut one's eyes to patent facts.

The annexed remarkable sample of erudition and perspicuity should not be passed by unrehearsed: "'Demean' (to debase oneself) is Old English *gemœ'ne*, common." Rev. E. Cobham Brewer, LL.D., *Errors of Speech and of Spelling* (1877), vol. i., p. 193.

In Mr. T. L Kington Oliphant's *New English*, where details are given of the diction of a novel by Miss L. E. Hawkins, published in 1811, we read: "The verb *demean* yourself is evidently a new phrase for *debase*." Not to mention many authors of inferior fame who flourished long prior to 1811, I have shown that this statement is invalidated by the pages of Samuel Richardson, Henry Brooke, Horace Walpole, Coleman and Garrick, Goldsmith, and Sheridan, and especially by those of Foote, whose plays Mr. Oliphant makes as if he had studied exhaustively. The pretentious author of *The New English* is here quite himself. He has not so much as consulted Archdeacon Todd's edition of Johnson's *Dictionary*.

Miss Evans, in *Adam Bede* (1859), and Sir George W. Dasent, twice in *Three to One* (1872), introduce *demean*, "debase," as though it were the special property of persons in humble life. But, as I have abundantly made manifest, it was not distinctly vulgar in the recent past; and, indisputably, it is not so at the present time. Still, on the whole, one can hardly be taxed with excess of nicety, if one chooses to follow the lead of Lord Macaulay, and gives it the cold shoulder.

Your obedient servant,

F. H.

Marlesford, England, December 13, 1890.

Notes.

A COLLECTION of Mr. Howells's essays from the Editor's Study of *Harper's Magazine* will be issued this month by Harper & Bros., under the title, 'Criticism and Fiction.' The same firm announces 'Literary Industries,' largely autobiographical, by Hubert Howe Bancroft, and 'A Flying Trip around the World,' by Miss Elizabeth Bisland.

G. P. Putnam's Sons announce 'The New Theology,' by Prof. John Bascom; 'Gospel Criticism and Historical Christianity,' by the Rev. Orello Cone; 'The Industrial and Commercial Supremacy of England,' lectures by the late Prof. J. E. Thorold Rogers, edited by his son, Arthur Rogers; 'The Irish Element in Mediæval Culture,' from the German of H. Zimmer, translated by Jane Loring Edmands; 'Sir Philip Sidney and the Chivalry of England,' by H. R. Fox-Bourne; 'A Year in Portugal, 1889–'90,' by Dr. Geo. B. Loring, late United States Minister to Lisbon; 'The Story of Portugal,' by H. Morse Stephens; 'The Evolution of the Ordinance of 1787,' by J. A. Barrett; 'Politics and Property; or, Phronocracy,' by Henry Slack Worthington; 'Parties and Patronage,' by Lyon G. Tyler, President of William and Mary College; 'The Corporation Problem,' by William W. Cook; 'Application and Achievement, and Other Essays,' by J. Hazard Hartwell; 'The Leaf Collector's Hand-Book,' by Prof. Chas. F. Newhall; and a 'Popular Hand-Book and Atlas on Astronomy,' by Prof. Wm. Peck.

Charles Scribner's Sons have in press 'On Newfound River,' a novel by Thomas Nelson Page.

Roberts Bros. will shortly publish 'My Three Score Years and Ten,' by Thomas Ball, the sculptor, and 'A Question of Love,' a Swiss story, by T. Combe.

A posthumous work, 'A Poet's Last Songs,' sonnets and lyrics by the late Henry Bernard Carpenter, will be brought out for the benefit of Mrs. Carpenter by J. G. Cupples, Boston.

Bernard Quaritch, London, has in preparation 'The Poetic Books of William Blake,' collected, with an explanation of their myth and meaning, by Edwin John Ellis and William Butler Yeats, in two volumes, containing more than 150 pages of facsimiles from poems engraved by Blake, with illustrations.

The 'Coöperative Index to Periodicals' for 1890, edited by Mr. W. I. Fletcher of the Amherst Library, has made its appearance (New York, 330 Pearl Street). It consists of two parts, subject and author, and is compressed into 140 pages. The change from quarterly to annual issues will, we believe, meet with approval.

'The Future of Electricity, or Babylon Electrified and Resurrected: A Dream of Science,' by A. Bleunard, translated from the French by F. L. White, just issued by Gebbie & Co., Philadelphia, is the same as 'Babylon Electrified,' published by the same firm in 1889. A portrait of Mr. Thomas A. Edison is added to the new issue, but otherwise the text and illustrations are the same in both books.

The useful Camelot Series (A. Lovell & Co.) now includes in its catholic embrace the 'Comedies of Alfred de Musset,' translated and edited, with an introduction, by S. L. Gwynn. The translation, on the whole, is as well done, perhaps, as it could be done; for of all people in the world a stylist of Musset's power is the most difficult to do justice to in another tongue. For instance, "See is Know, Will is Can, and Dare is Have," may be a passable rendering of the French "Voir c'est Savoir; Vouloir c'est Pouvoir; Oser c'est Avoir"; but what can atone for the lost rhyme and lilt of the original? Apart from this inevitable loss in translation, the book is a distinct gain, for it offers the American reading public some charming plays by a master whom they unfortunately read but little. The introduction gives a rather brutally just account of Musset's life and a rather insular critique of his works. An occasional misprint, such as the repeated "*l*achimo" for "Iachimo" (p. 40), mars the good appearance of the print.

'One of Our Conquerors' has been added to the new (author's) edition of George Meredith's novels which Roberts Bros. are bringing out.

Mr. William Dallam Armes of the University of California has reprinted the late George Henry Lewes's 'Principles of Success in Literature' (San Francisco: Samuel Drew & Co.). In so doing he has sought to benefit students of literature and composition, and to furnish a class-room manual, following in this, as he says, the example of Prof. Albert S. Cook, several years ago. The essay originally appeared in the *Fortnightly Review*.

Ward, Lock & Co.'s "Minerva Library" has just been enlarged by the addition to it in one volume of Beckford's 'Vathek,' portions of his suppressed 'Dreams, Waking Thoughts and Incidents,' from the copy in the British Museum, and his letters on Spain and Portugal. This was a compilation well worth making, and it offers a great deal of entertainment for a small price.

Mr. William Houston, Librarian to the Ontario Legislature, has brought together 'Documents Illustrative of the Canadian Constitution,' with notes and appendixes (Toronto: Caswell & Co.). While the value of this collection as a mere work of reference is obvious and incontestable, the author has also had in mind its use in the historical seminary, as he points out in a sensible introduction. He has omitted all French documents except the capitulations of Quebec and Montreal, on the ground that the line of development of the Canadian Constitution leads back to the colonial governments of what is now the United States, by way of our Constitution, which Mr. Houston reprints after very careful collation, with original notes. In like manner, his chronological table is arranged with right and left-hand entries so as to show side by side the events for Canada and the United States. The chapters on Canadian Boundaries, Extradition, and Fisheries, again, appertain to both countries. In short, Mr. Houston's scholarly labors are of international utility, and his volume should find a place in all our libraries and in every well-regulated newspaper office.

'Barker's Facts and Figures for the Year 1891' (Frederick Warne & Co.) is a dictionary annual, beginning with Abbreviations and ending with Zinc. It would be impracticable to give here an idea of its contents beyond mention of a few heads, such as Armies, Church, Crime and Criminals, Exhibitions, Expectation of Life, Foreign Weights and Measures, Franco-Prussian War, Imports and Exports, Ireland, Life Assurance, London, Marriages, Occupations of the People, Population, Railways, Rowing, School Board, Suicides, Wages, Wills (of millionaires), Wool Trade, Wrecks, etc., etc. The cross-references are abundant. There are no proper names of persons among the entries, and the annual has no political complexion.

'The Care of the Sick' is a perfectly descriptive title of one of the latest and most valuable books upon that subject. It is drawn from the wide experience of the famous Prof. Billroth of Vienna, and has been satisfactorily translated by J. B. Endean (Scribner & Welford). The great surgeon gives the same attention to details as did the ancient sculptor, and with the same happy result. Trifles make perfection. Hospitals and families alike should profit by this volume, prepared for their special benefit and in no respect written above them. Nor does it descend to useless commonplace. It is clear and dignified in tone, and, charged with sympathy and competent knowledge, is interesting and useful in the highest degree, as we can testify from very careful examination.

In our regular service the medical officers are required to instruct carefully the men of the Hospital Corps, and certain other soldiers designated as company bearers, in the transportation and first aid of their comrades who may be disabled in action or otherwise. Many medical officers of the National Guard all over the country are zealously doing similar work. Both of these classes, and we may add the police surgeons of the great cities as well as the intelligent rank and file of all these organizations, will find in 'The Soldier's First-Aid Hand-Book,' by the late Capt. Wm. D. Dietz, Med. Dept. (John Wiley & Sons), a very valuable compendium of such instruction. This little book is a syllabus of Capt. Dietz's lectures to his own detachment, and contains in compact but clear form the outline of the information that such men should have. It is useful to the men as showing what they should know, and to the medical officers as a skeleton of such lectures. Line officers and others in charge of outlying parties, without medical aid, would find it useful. It is interleaved, has flexible covers, and is copiously indexed for easy reference.

In mentioning the publication of the William F. Allen Memorial Volume, the other day, we omitted to state that the price fixed for the few extra copies printed for sale is $2.25. They can be had of the Chairman of the Editorial Committee, Prof. David B. Frankenburger, Madison, Wis.

Schopenhauer's principal work, 'Die Welt als Wille und Vorstellung,' has been added to the Reclam Library, and may now be had, *bound*, for a mark and a half, or less than forty cents. F. A. Brockhaus in Leipzig has also just issued a valuable 'Schopenhauer-Register,' containing in alphabetical arrangement references to passages in Schopenhauer's complete work on all conceivable topics. From Frauenstedt's 'Schopenhauer-Lexikon' this new work differs in containing no extracts, but only references, which, however, are much more copious than in the Lexicon.

Nearly four years ago we noticed Theodor Vetter's painstaking monograph on 'Der *Spectator* als Quelle der *Discurse der Maler*.' Dr. Vetter is now editing the 'Discurse' for the "Bibliothek älterer Schriftwerke der deutschen Schweiz," with annotations which designate, among other things, the respective authors of the essays in this Swiss imitation (1721-22) of the *Spectator* (Frauenfeld: J. Huber). A rubricated facsimile of the original title-page accompanies Part I. of the reprint. From the press of F. Schulthess, Zürich, we have received also a thin pamphlet from the pen of Dr. Vetter on a kindred theme, viz., 'Zürich als Vermittlerin englischer Literatur im achtzehnten Jahrhundert.' He finds traces of intellectual interchange with England as far back as 1536, partly through the visits of theological students from that country, partly in consequence of the clerical exodus due to the persecution of Queen Mary. When he reaches J. J. Bodmer, the founder of the above-mentioned *Discurse der Maler* and a writer under many names, Dr. Vetter has to deal with the most active propagator of English literature in Switzerland, and more than half the brochure is devoted to him.

The vexed question of transliteration from the Russian into English is taken up and learnedly discussed by Mr. J. Sumner Smith of the Yale Library, in the *New Englander* for May. He does not find himself wholly in accord with any of the recent attempts to secure uniformi-

ty, such as the scheme of the American Library Association, that of the late Michael Heilprin, that of the United States Board on Geographic Names, or that advanced in *Nature* last year. The article is intended to provoke discussion.

Nature for March 26 prints the twenty-seventh of its biographical sketches of "Scientific Worthies," accompanied, as usual, by an excellent portrait on steel. The subject is Louis Pasteur.

A portrait of the late J. O. Halliwell-Phillipps and a view of his grave adorn the April number of *Shakespeariana* (New York: Leonard Scott Publication Co.).

The official organ of the American Photographic Conference and of the Society of Amateur Photographers of this city calls itself the *Photo-American Review*, and the first number is issued from No. 92 Fifth Avenue, New York. It is a bewildering maze of process-plates, chiefly scenic, and of more or less descriptive letter-press, followed by technical articles on photography, official notes of the Conference and the Society, a list of new books (apparently very carefully done), and an astonishing "review of 530 new books," of course in short measure and very perfunctory. The projectors of this well-printed magazine can at least plume themselves on having produced something unique.

Novel, too, is the *Courrier Français de l'Ouest Américain* (Chicago and Milwaukee), though it is now in its second year. The literary miscellany is quite overshadowed by the heliogravure and aquarelle plates, which include a good portrait of President Carnot. These have all been executed by Lemercier & Cie. of Paris, "the most important art firm of that capital," as we are told.

The classification and distribution of the native races of Brazil is the subject of the principal article in the last *Petermann's Mitteilungen*. Until very recently, according to the author, Dr. Paul Ehrenreich, it has been held impossible to bring order into the chaos of South American tribes and languages. The latest investigations, however, show that there is no extraordinary number of races, but that they all can be gathered into a few great families, of which he names eight. And instead of their being scattered in hopeless confusion over the continent, these families occupy certain definite districts or distinctly marked lines of migration from these centres. His conclusions have been reached mainly through the careful study and comparison of the various languages and dialects. That they are correct is the more probable from the fact of the extraordinary purity of the languages of most of the tribes of the interior. Many Indian words are in common use among the whites, but the Indians themselves, in some instances after a century's intercourse, have adopted only European terms for articles of barter. A map showing the distribution of the great families in Brazil and the contiguous countries accompanies the article.

Admirers of the late Dr. Howard Crosby may obtain a gratifying souvenir of this public-spirited citizen, an imperial photographic portrait of him having been added by Mr. F. Gutekunst, Philadelphia, to that distinguished series which we very recently had occasion to refer to anew.

—The series of articles upon horses which Mr. H. C. Merwin has contributed to the *Atlantic* for some months past has been of an unusual character, and must have found many interested readers in the class to which such a subject appeals; but in the May number of the magazine the author takes up a phase of the matter in which the public is more generally concerned. He discusses the duties of the owner or user of the animal, and grounds them very rationally in the nature of the horse. He does not think that the horse is so sociable, sensible, or trustworthy as the dog, but finds the distinctive characteristic in the animal to be its nervousness; with this goes, of course, an unusual capacity for suffering, whether from brutal or neglectful treatment or a mere lack of understanding of the creature's nature. Mr. Merwin pleads for humane treatment in general, and, in fact, for that care which springs from affection or pride. He shows how much more a horse can be to a man than a mere article of property; but he reserves most of his force to persuade owners that horses used for pleasure, and therefore accustomed to a certain kind of care and work, should not be abandoned to the auction-room and its sequel of suffering when they become old or in any way useless as pleasure-horses. He contrasts the American mode of training, known as "gentling," with that old English mode which was called "breaking," and refers to its results in this country in the improvement of the trotting-horse. Altogether, the article is an admirably definite, reasonable, and well-directed discussion on a subject on which public feeling is still less humane and less effective than civilization requires; and the paper has the more weight because of the spirit of experience that gives to it a very practical character. Other articles out of the common course are an extremely technical one upon the teaching of arithmetic, a brief biography of Jeremy Belknap, the founder of the Massachusetts Historical Society, and some extracts from Richard Henry Dana's journal in China.

—The artistic novelty of the *Century* is a few pages of reproductions of the sketches, studies, and memoranda exhibited by the artists of this city at the Fellowcraft Club. They are in themselves interesting, and are used by the writer, who furnishes a brief introduction, to plead that the artists do their best work when unhampered by any consideration of the public taste. A second curious series of cuts is that illustrating a paper upon "Visible Sound," in which the experiments made by Margaret Watts Hughes by singing into a resonator, prepared for the purpose, are described, and the forms caused by the vibrations on a membrane spread with some unstable substance are pictured. These ocular equivalents of musical tones, however, it appears from the comment by Sophia B. Herrick, are suggestive rather than scientifically valuable. In the historical parts of the number the account of how the Confederate diplomatic agents in England and France found themselves handicapped by the place of slavery in the Southern system, is told by Mr. Bigelow, and the diary of Minister Dallas is put under contribution for a view of the Russian Court in 1837. A sympathetic biography of Louisa May Alcott, a rather fantastically written travel and character sketch from the Bulgarian political field, and a sporting article on Florida fishing, give variety to the number.

—*Scribner's* is much devoted to fiction, but we find a readable article upon "The Ship's Company," another descriptive of the scenes and character of Broadway, and yet a third upon Shakspere as an actor. In all of these the cuts are the main thing, and the text is principally remarkable for the clever way in which it stretches itself out without boring either the writer or the reader. In particular, the paper upon Shakspere is a marvel of bubble-blowing. What we know of him as an actor is so little that it could be told in a very short paragraph, and consequently the author of this long article has naturally written of many other matters; but what an effort he makes to keep to his subject may be judged by this sentence, upon the mention of Shakspere as acting before Elizabeth in 1594: "It is quite possible that her Majesty might have desired to see for herself something of the qualities of one of her subjects who, she was probably well aware, had already acquired considerable reputation, and who, she may have reflected, was destined, by the exercise of his surpassing powers, of which he had given substantial evidence, to add undying lustre to the period of her reign." This is about as useless writing as there could well be, and the paper is full of similar stupidities. Mr. Davis does much better with "Broadway"; he is lively and sketchy, and has a feeling for the life of the pavement, and it must be acknowledged there is more character in his text than in the illustrations. The "Transfer of the Temples of Ise," by Mr. House, describes the ceremony of carrying the sacred relics of Japanese religion from one set of temples to another duplicating the first, which takes place every twenty years; and it contains the information that it has been suggested to the Japanese Government to send over the old temples to be set up at the Chicago World's Fair in the Japanese exhibit. The fiction, by Mr. Stimpson, Octave Thanet, and Mr. Sullivan, is of very even quality and excellent workmanship.

—A most interesting discussion of the "Rectification of Chronology by means of Ancient Eclipses," by Prof. John N. Stockwell of Cleveland, Ohio, appears in the *Astronomical Journal*, No. 240, April 21. According to Mr. Stockwell, an entirely new least is to be made of some of the most important dates of ancient history. We give below the dates arrived at by Mr. Stockwell. The chronologist by profession will of course take many things into account besides reports of eclipses; but it is interesting to see what conclusions a rigid astronomical consideration, pure and simple, leads to:

"*First*, Jerusalem was destroyed by Titus in the year 69 A. D. instead of 70 A. D.

"*Second*, Augustus died in August, 13 A. D. instead of 14 A. D.

"*Third*, The last year of confusion in the Roman calendar was 47 B. C. instead of 46 B. C.

"*Fourth*, Cæsar's Spanish War was in the years 47 and 46 B. C.

"*Fifth*, Cæsar was assassinated in March, 45 B. C., instead of 44 B. C.

"*Sixth*, Jerusalem was taken by Pompey in 65 B. C., and by Herod in 38 B. C.

"*Seventh*, Herod's eclipse occurred in the year 5 B. C., September 15; and Herod died early in the year 4 B. C.

"*Eighth*, The Persian invasion of Greece by Xerxes occurred in the year 481 B. C., instead of 480 B. C.; and

"*Ninth*, The Era of the Olympiads commenced in July, 777 B. C., instead of 776 B. C."

—In the *Figaro* of March 21 there is a brief and interesting study, by M. Edmond Poirier, entitled 'Comment meurent les Bonaparte.' For the most part they die early and die in exile. Only three of the race have closed their eyes in France. None of them have attained extreme old age. Charles Bonaparte, the father of the Emperor, died at the age of thirty-eight, Napoleon at fifty-two, Caroline at fifty-six, Pauline at forty-four, and Eliza at forty-three. Of the next generation the Duc de Reichstadt died at twenty-one; the two daughters of Joseph at fifty-three and at thirty-

eight; of the children of Lucien, the Prince Pierre reached sixty-three, but the Prince of Canino died at fifty-four, and Prince Lucien at forty-four; the eldest son of Louis, who was to have been Napoleon's successor, died untimely at the age of eight; the second, Louis, at twenty-seven, and his son, the Prince de Monfort, at thirty-three. These names and dates are as given by M. Poirier. Some of the dates are open to question, and there are omissions in the list of names. As to his main thesis, that the Bonapartes are hereditary arthritics, M. Poirier seems to go upon more solid ground. He finds the family to have been markedly liable to gout and its kindred or accompanying diseases—rheumatism, affections of the heart, diabetes, cancer. The father of Napoleon died of cancer of the stomach, as did Napoleon himself; so, also, according to M. Yung, Lucien. Caroline, too, succumbed to the same disease, and M. Poirier, who puts no trust in the stories that appear in the pages of some reputable authorities, believes that Pauline met the same fate. Thus there are four or five of the family who died of cancer of the stomach alone. Besides these, Prince Pierre died of a cardiac disorder resulting from rheumatism; and diabetes appeared in Jerome and his descendants. King Jerome himself was carried off by a gangrenous pneumonia, which was an accident of his disorder, and his son was equally diabetic. M. Poirier does not mention the stone which caused the death of Napoleon III., probably for good reasons.

—In speaking of M. Édouard Drumont's 'Dernière Bataille,' we ventured to express the hope that the title might possibly be meant to convey a hint that the long and foolish anti-Semitic campaign of its author was drawing to an end, in spite of his announcement of a 'Europe Juive' in preparation. A new volume by M. Drumont has just been published with a title even more promising than the last, viz: 'Le Testament d'un Anti-Sémite.' Apropos of the Jews, it may be worth while to say, though the mention comes a little late, that there was a very good article about them by M. Anatole Leroy-Beaulieu in the *Revue des Deux Mondes* of February 15. According to this writer, the whole number of the Jews is about eight or nine millions, one-half of whom are encamped in Russia. The centre of gravity of Israel is somewhere on the borders of old Poland, or of Austria-Hungary. In the east of Europe the Jewish population increases by the constant excess of births over deaths; in the west, chiefly by immigration. There are about 80,000 of them in France, of whom a full half are in Paris. Of these, however, M. Leroy-Beaulieu says nothing, or next to nothing.

—At a meeting on Saturday of the Baltimore Committee of the women interested in raising a fund for the Medical School of the Johns Hopkins University upon condition of its receiving women upon the same terms as men, it was announced that the fund now handed over to the Trustees amounts to $111,300. It was also announced that Miss Garrett has offered an additional hundred thousand dollars to the Trustees on condition that they shall have in their hands and shall set apart for the use of the Medical School by February 1, 1892, the remaining sum necessary to complete the required five-hundred-thousand-dollar endowment. Miss Garrett's offer is accompanied by the further provision that if at any time the women studying in the Medical School shall not enjoy all its privileges or shall not be admitted to all its prizes, dignities, and honors on the same terms as men, this hundred thousand dollars shall revert to her or to her heirs. The Trustees have accepted Miss Garrett's offer, with its conditions attached, and have pledged themselves, individually, to endeavor to obtain the $219,000 which, in addition to the women's fund and to the sum bequeathed to the Medical School by Dr. Baxley, remains to be collected. This they ought to have no trouble in doing: the friends of advanced medical education in this country ought to show a grateful appreciation of Miss Garrett's generous initiative, and the opening of the Johns Hopkins Medical School in 1892 ought to be quickly made a matter of certainty.

—"The run Ibsen has had this winter among the select few in London," writes a correspondent in that city, "is not yet at an end. The last of his plays attempted (still another is announced for next month) is 'Hedda Gabler,' which was performed for the first time at the Vaudeville Theatre in the Strand on April 20. The play proved much the most dramatic in the series, and the performance was by far the most finished, the merit of Ibsen's interpreters hitherto being intention rather than accomplishment; but that which makes it specially interesting to Americans is the fact that its managers and leading performers were two young American actresses, Miss Elizabeth Robins and Miss Marian Lea, who have for several years past been living and working in London. Both are women who have really studied their art, who believe that on the stage knowledge counts for more than impulse, and who, for that very reason, probably, have not met with the success they deserve in the English theatre, that home of sentimental amateurism. Miss Robins has been seen in minor parts in two other of the Ibsen plays, in 'The Doll's House,' where she appeared as *Mrs. Linden*, and in 'The Pillars of Society,' where, as the maiden aunt, she may be said to have redeemed the play. She has also, at intervals, been included in the regular programme of the Shaftesbury and Avenue Theatres. Miss Marian Lea made a decided hit a few years ago upon her first appearance as *Audrey* in Lady Archibald Campbell's 'As You Like It'; but since then she has had small chance to test her powers except in an afternoon performance of 'Mademoiselle de Belle-Isle,' in which she showed no little strength. In 'Hedda Gabler' both have scored a distinct success, already recognized by the London dramatic critics. Nothing could have been better than Miss Robins's *Hedda*, the restless, bored, jealous, essentially modern woman who, because she was tired of dancing, married the first man who crossed her path at the moment, and speedily repented it, and who, for the sake of a sensation, plays recklessly with and ruins the lives of her first lover and the woman he now loves; nothing better than Miss Lea's *Mrs. Elvsted*, the timid, gentle, weak woman who, in her weakness, married for a home, and then, when too late, found happiness and strength to live her own life in the work and devotion of a man who is not her husband. It is doubtful whether 'Hedda Gabler' could ever appeal to the general public; but if the five performances which these two enterprising young actresses have given will, as they ought, bring them into greater prominence on the London stage, the London playgoing public will have much to be thankful for."

THE ARISTOTLE PAPYRUS.

Aristotle on the Constitution of Athens. Edited by F. G. Kenyon, M.A., etc. Second edition. Printed by order of the Trustees of the British Museum. 1891. Pp. lii., 190.

THERE seems to be no reasonable doubt that, in the writing on the *verso* of papyrus No. CXXXI. of the British Museum, the modern world has recovered, in a transcript made about 80-90 A. D., the much-quoted but long-lost description of the Athenian State ascribed by the ancients to Aristotle, and always looked upon as the most authoritative work of its kind. The presence in this manuscript, in an appropriate context, of practically all the eighty-five or more extant fragments of the book—preserved in more than 240 quotations made, at first, second, third, and even at fifth hand, by many writers at least from Didymus (B. C. 30) onward—creates an overwhelming presumption in favor of this identification. Whether the original treatise was by Aristotle or by an immediate pupil, as Rose has maintained, is quite another question. It can be proved, however, we believe—though this is not the place to do it—that the historian Philochorus, writing before B. C. 306, or less than twenty years after the composition of the work, quoted it as Aristotle's, sometimes to supplement, sometimes to controvert, its statements. This testimony as to its authorship, which is earlier than any hitherto pointed out, should, if demonstrated, have great weight in settling the question.

On the *recto*, the best side for writing, are the accounts of a farm-bailiff in Egypt—his name, Didymus, but more especially the name of his master's father, Pollux, will give rise to curious theories—for a part of the eleventh year of Vespasian (A. D. 78–9). The editor dates the transcript at a time when these accounts had lost their value, *i. e.*, about 100 A. D. The fact, however, that foreign matter previously written is allowed to break the continuity of the narrative (c. 25), instead of being detached, seems to show that the writer desired to retain the writing on the other side of that part of the papyrus, *i. e.*, the opening columns of the accounts. The owner of the manuscript wished to keep these accounts unbroken; hence the transcript must have been made not very long after 79 A. D.—nearer to this date than to 100 A. D.

The beginning of the treatise is lost, and the final columns are sadly mutilated. But the fact that all the quotations are here, or are otherwise accounted for, shows that little is missing, and that we have the work in its original unabridged form—an inference borne out by its literary features. An historical sketch takes up about two-thirds of the text. Here the writer passes rapidly in review the several phases of the constitutional history of Athens from the period before Draco down to the Restoration in 403 B. C., dwelling very fully on the work and reforms of Solon (cc. 5-12), and on the constitutional changes, actual and proposed, after the Sicilian disaster (cc. 29-41). In the last third of the book (cc. 42 63; coll. 31-37) a condensed but lucid description is given of the machinery of the State at the time of writing (between 328 B. C. and 324 B. C.): it begins with an account of the enrolment of citizens and of the regulations about the ephebi; then the various public offices and boards, with a few important omissions, are described, including—in the following order—the Senate, the prytans, proedri, treasurers, auditors, city inspectors, commissioners of highways, market overseers, inspectors of weights and measures, the police board, judges in petty cases, arbitrators, public secretaries, cultus-ministers, archons (very fully), athlothetæ, generals, and subordinate military officials, etc. The work closes with a very minute

account of the jury-courts and their equipment, and of legal procedure.

In the summary at c. 41, the writer divides the constitutional history of Athens, after the establishment of the state by Ion, into eleven periods, or epochs of change, of which the account of only the first is lost, viz.: First, Theseus, a slight deviation from absolute monarchy; second, Draco, the law first recorded; third, Solon, democracy founded; fourth, Peisistratus, tyranny; fifth, Cleisthenes, democracy reëstablished in a more pronounced form; sixth, after the Persian wars, the revived Areopagus; seventh, the epoch introduced by Aristeides and Ephialtes, in which the Areopagus is reduced in power (B. C. 462–1), and the state, following unworthy party-leaders, degenerates, mainly because of its naval development; eighth, the rule of the Four Hundred; ninth, the renewed democracy; tenth, the Thirty and the Ten; eleventh, the Restoration and the subsequent period, marked by constant increase of the power of the people. The party-leaders in these changes were: Of the people, Solon, Cleisthenes, Xanthippus, Themistocles and Aristeides, Pericles, Cleon, Cleophon; of the better class, the rich and the well-born, Peisistratus, Miltiades, Cimon, Thucydides (son of Melesias), Nicias, Theramenes. The writer's favorites are, after the men of an earlier date, Thucydides, Nicias, and Theramenes.

Throughout the work there is definite information as to dates—over forty explicit datings, by archons and by numerical computations; the narrative is brightened by ten or a dozen anecdotes, of which three are new; there are quotations from the poems of Solon, with seventeen new verses, and from patriotic scolia or banquet songs; now and then a maxim of worldly wisdom, with touches of humor such as the reader of Aristotle's moral works might expect. The book is not a dogmatic treatise, nor yet a collection of notes: it is rather an historical and descriptive essay, and its style is natural, spontaneous, clear, and flowing—the opposite of jejune and crabbed—with anacolutha and other evidences of an unstudied art; a style that shows more of unconscious regard for literary form, and in particular for the rules of Isocratean composition, than marks the other extant writings of Aristotle. Indeed, if this work be accepted as Aristotle's, our conception of the literary art of the Stagirite is enlarged by it, and we can begin to understand what Cicero meant by his *suavitas* and *flumen orationis aureum*, and that Plutarch was not wholly wrong when he asserted that in his 'Constitutions' the style of Aristotle was vigorous and graceful. The skill with which the writer can tell a story is nowhere more apparent than in the three new anecdotes, viz., the scene at the torture of Aristogeiton (c. 18), the account of Themistocles's device for arousing Ephialtes to action against the Areopagus (c. 25), and the undatable incident, in which Eumelides (hardly Eumeleides) was chief actor, that led to the assumption by the Demus of certain absolute powers exercised by the Senate (c. 45).

The interesting and important question of the author's sources receives little light from any direct statements of his own. Solon's poems are repeatedly quoted, and yet the section of continuous quotations (c. 12) looks oddly like an interpolation, when one notes its context; of course, it may have been the author's interpolation. More than once the writer appeals to the testimony of inscriptions, and, in his citations of decrees, there is, incidentally, an interesting proof of his fidelity: the only instances—out of eighteen or nineteen final clauses with ὅπως—of ὅπως ἄν with the subjunctive, the idiom in Attic inscriptions, are found in two quoted decrees (cc. 29, 30). He often cites and sometimes criticises divergent views on historical matters, classifying authorities, but—except once—does not give names (pp. 6, 16, 19, 26, 41, 46, 48, 80). Herodotus is named in c. 14, and is followed, with interesting variations, elsewhere (c. 20). Thucydides appears to be controverted at c. 18, and is followed at c. 33, but is never named. Theopompus was probably in the writer's mind at c. 27 (cf. Plut. *Cim.* 10), and elsewhere, though he can hardly have been followed in cc. 28 41. Androtion is verbally quoted in c. 22; but the fact that his view of Solon's seisachthy is not controverted at c. 6, suggests that his 'Atthis' had not gained general currency before this treatise was written. Mr. Kenyon's uncertainty as to Androtion's date is not justifiable; Androtion can have been none other than Isocrates's pupil, Demosthenes's opponent, the author of the decree edited by Schäfer in *Rhein. Mus.* 33, 418 ff. There are traces of Ephorus, of Cleidemus and other writers of Atthides, and now and then a reminiscence of Isocrates, but the author appears always to frame his own account and to draw his own inferences. His spirit is that of a judicial observer and man of affairs, of pronounced aristocratic sympathies; his judgments, if sometimes partisan in coloring, are not petty nor marked by fantastic conceits; he exposes the weaknesses of popular government, but fails not to appreciate its excellences: "the many," he says, "are less open to corruption than the few"—a doctrine unlike that of Plato's remnant.

Athenian history, in its main features, will remain unaffected by this discovery, but in many of its details it gains, with the new light on dark places, unlooked-for definiteness and richness. Some of the more salient of these new aspects should be here mentioned. Though almost as many difficult questions are raised as are solved, and though all unsupported assertions should be put to the test of a rigorous criticism, Attic chronology at least is more certain than it was. The archon-list, for example, has been notably enlarged: we have, besides full confirmation of old names, the following new ones: Epilycus, an ancient polemarch; Aristaechmus, B. C. 621-0 (?)—Draco was not archon at the time of his legislation; Hegesias, B. C. 555-4; Philoneos, B. C. 527-6; Harpactides, B. C. 511-0; Hermucreon, B. C. 501-0; Telesines, B. C. 487-6; Hypsechides, B. C. 481-0 (not the editor's Hypsichides); Mnesilochus (not Mnasilochus), B. C. 411, for two months. Our information as to the history of many offices receives bewildering accessions and modifications. About the archons we are told that they were created in this order: first King, then Polemarch, Archon, and six Thesmothetae (the last probably about 680 B. C.). The use of the lot in designating the nine archons was introduced by Solon, but choice was made only from forty candidates previously selected; this arrangement held, with slight modifications—one hundred picked candidates instead of forty—down to a very late period. The Senate, under Draco of 401 members, chosen by lot, under Solon of 400, under Cleisthenes and after of 500, originally had summary jurisdiction over the lives of citizens. The history of Athenian government is the history of the gradual appropriation on the part of the Demus of all powers and privileges. Cylon antedates Draco, who, political reformer as well as jurist, is said to have committed the State to all persons bearing arms, an assertion that has the look of an anachronism. The timocratic classification of the citizens ascribed to Solon was in partial use earlier; Solon's seisachthy was an actual cancelment of debts, public and private.

There is much new light on Peisistratus and his sons. Before the Alcmæonidæ, one Cedon was famed in scolia as the foe of tyrants. The account of the conspiracy of Harmodius and Aristogeiton differs in some essential particulars from that of Thucydides. Aristogeiton was cruelly tortured by Hippias and slain by the tyrant's own hand in a frenzy of rage. Cleisthenes's demes were not necessarily one hundred in number: having first organized the demes as local political units, he grouped them into thirty larger units called trittyes—of which ten were near Athens, ten on the shore, and ten in the interior; each of the ten new tribes was then made up of three trittyes drawn by lot from the three districts. The Areopagus had extraordinary powers from the Persian wars to B. C. 462, when it was shorn of them by Ephialtes and Themistocles. Aristeides did not throw open the archonship to all the classes of citizens; the first zeugite to be chosen was Mnesitheides, in B. C. 457; the thetic class as such never could furnish archons even in the writer's time. It was by Aristeides's advice that the people flocked in to Athens from their country homes, with the result that, not many years after the Persian wars, more than 20,000 persons were on the state's pay-rolls. Pericles was not prominent as a statesman until about 455 B. C., and in 451-0 B. C. carried through his much-discussed law prescribing purity of descent as a condition of citizenship. The Peloponnesian war is hardly mentioned except in fixing a date, and notables like Hyperbolus, Alcibiades, and Peisander are not even named; but in the long and picturesque account of the period between 411 B. C. and 403 B. C., there are many items in general supplementary of Thucydides, Lysias, and Xenophon, though in not a few cases irreconcilable with their statements. There seems to be no place for the dramatic scene of the arrest of Theramenes. The final overthrow of the Thirty and the reconciliation with the secessionists at Eleusis took place two years, not immediately, after the Restoration. The sketch of this decade is a good example of vigorous though unpolished writing, and is rendered attractive by the deeds and sayings of the worthies Rhinon and Archinus. The 'Politics' had already taught us that this period, with its abortive attempts at constitutional organization, was a favorite one with Aristotle.

In the second part of this treatise, with its multitude of details, there is less that is actually new, but everything is clearly though tersely put. It is a vast advantage that we now have the Aristotelian quotations in their own context, rid of confusing accretions, and this part of the book is of incomparable value, giving, as it does, definite and trustworthy information on many dark points; in particular, we have satisfactory news about the ephebi, dates of elections, the duties of a host of officials. Scattered through the work are many bits of such information, as on the pay of officers from archon to dicast, on the civil-list in general, on the provision for orphans and incapables, on legal fictions. It is interesting to be told that Solon's debasement of the coinage was called "expansion of the currency," and to read of what may have been "blocks of ten" in the jury courts—an invention of the excellent Anytus.

The 'Constitution' is a surprise in its omissions as well as in its new yields. We miss,

for example, an account of the important regulations as to legislative procedure adopted under and after Euclid, and of the important changes in the Athenian financial system in the fourth century B. C., which figure in Philochorus; the nomophylaces, by Grote ascribed to Pericles and Ephialtes, are now recognized to be a very much later institution, but surely the nomothetae were important—quite as significant as, at least, the astynomi, whose first duty named was to see that flute-girls should not receive more than two drachms for their job, and that the city scavengers should not dump rubbish within the city walls.

Mr. Kenyon has shown great skill in deciphering the manuscript, and his treatment of historical matters is in the main judicious. But, as he himself admits, an *editio princeps* cannot be final. The text bears evidence of hurried preparation or revision in not a few blunders in grammar and in restorations which, palæographically possible, are improbable from the point of view of language. A familiarity with the corroborative or corrective evidence of Attic inscriptions, and with what has been doing in Germany in late years on Greek constitutional history and antiquities, would have made his notes, some of which are wofully out of date, much more valuable; he might have corrected Schömann by Schömann and Boeckh by Boeckh. There is both too much and too little information about the manuscript readings. The note on abbreviations (p. lii) is inadequate; several of the signs have a somewhat wider range, and others are used more arbitrarily, than we are told. There are gaps in the report of the readings of the original text, which was not always intelligently revised by the ancient hand, showing vagaries in spelling, some of which are interesting as throwing light on the pronunciation of Greek in Egypt about A. D. 80–90. The editor's own text also exhibits inconsistencies and an erratic orthography. The facsimile shows that sometimes—not often—the readings given in the printed text with no *caveat* are not absolutely certain, but only possible. Every instance of this sort should have been religiously pointed out. In the original text are not a few corrupt passages, and the temptations to emend the papyrus readings are numerous. Proper names require overhauling. At p. 11, 5–7, perhaps read τούτου [ἔδει εἶναι καὶ] κτλ μέχρι Εὐθύνου; p. 27, 14, τρεῖς, if right, belongs with ἑβδομήκοντα, l. 13, not with ἑξήκοντα; p. 36, 10, διαψηφισμόν (cf. ἀποψηφίζειν, Dem. *Cor.* 132); p. 45, 8–11 cannot be right; p. 55, 2, οὐκ (ἂν) συνεπίπτεν; p. 76, 4, ὥστ' ἐξῆν or ὅπως ἐξῇ; p. 98, 7, πρεσβεῖς (οὖν) or (δέ), and often (τόν) with τόνδε τρόπον; p. 101, 13, πρὶν ἀναγραφῆναι or πρὶν ἂν ἀναγράφηται (cf. p. 149, 8); p. 116, 5, erase τ', or read καὶ οὗτοι ἀφεῖναι (cf. p. 138, 11), etc. And there are many places where a better restoration seems probable than Mr. Kenyon's; *e. g.*, p. 2, 6, ἦν γὰρ [τότ'] ἡ (cf. the probable ἔπεμπον τό[τε] μεθ' ὅπλων, p 48, 16); p. 16, 4, 5, οἱ [βουλό]μενοι βλασφημεῖν (cf. p. 79, 7); p. 16, 19, μέμνηται (cf. p. 28, 24); p. 43, 3, τῶν δὲ κοινῶν [αὐτὸς ἐπιμελήσεσθαι (cf. p. 43, 17); p. 44, 16, δ[ι'] ἡσυχίας or τ[ὴν] ἡσυχίαν; p. 44, 26—45, 1, ἔμεινε [κύριος ὢν καὶ ὑπό]τ' ἐκπέσοι (there seems to be hardly room for the tempting ἐν τῇ ἀρχῇ); p. 45, 16, ἐφ[ευ]γεν; p. 71, 7, ἐφαιρεθέντας; p. 80, 20, Πυθοδώρου το[ῦ Πολυζή]λου; p. 99, 7, συλλαβόντες [δὲ καὶ Δ]ημάρετον; p. 135, 8, ἀλλ' ἢ τοῦ (cf. p. 130, 14). In some of these suggestions we observe that we have been anticipated.

Many of the editor's remarks and notes need revision. To the list of absent fragments, add No. 360 (p. xv, 21). The sketch of early conditions on pp. xx xxii is fuller than the text bears out. The demes were combined by Cleisthenes into trittyes, not the trittyes subdivided into demes (p. xxxii). The Thirty were not known as "tyrants" in their own generation (p. xliii). The scholiast on Ar. *Nub.* 37 can hardly have got his passage from Harpocration (p. 56); in such cases the scholiast is ultimately the great Didymus, from whom, through Pamphilus, Harpocration himself drew. An inferior text of Pollux is quoted at p. 177, and the MSS. of Lex. Cantab. read ἐπιχειροτονίαν (p. 112). The note on Nicomedes is inept (p. 61); the word means 'masterful in counsel,' like N cobulus, not 'conqueror of the Medes.' Though θυρίδες (p. 125) commonly means 'windows,' its use here, in the sense of 'doors,' seems to be sustained by [Arist.] *Oec.* ii 4; but certainly all that the regulation signifies is that doors (and windows) should not swing into the street; they might—set back in a vestibule—swing towards it.

With all its blemishes, however, the text as furnished by Mr. Kenyon has its permanent value, and must form the basis of all future work on this book, of which the editions promised by Diels, Kaibel and Wilamowitz-Möllendorff, Sandys, and perhaps Herwerden, will be but the beginning. A decade or two must pass before this memorable discovery—the most extraordinary of its kind since the Renaissance—can be properly appreciated in all its bearings; for some time to come we shall swing back and forth between the extremes of opinion as to the authorship and ultimate value of this 'Constitution of Athens.' The final result will be not only a richer and more intelligent knowledge of Athenian history and political and legal antiquities, and of certain aspects of classical historical literature, but also the introduction of greater order and organization into much of the later derived literature, of which this treatise is a sort of key, and a distinct clearing of the atmosphere in that already popular branch of classical research known as the study of sources.

RECENT FICTION.

Juggernaut: A Veiled Record. By George Cary Eggleston and Dolores Marbourg. Fords, Howard & Hulbert. 1891.

The Sardonyx Seal: A Romance of Normandy. By Belle Gray Taylor. G. P. Putnam's Sons. 1891.

"Down the O-h-i-o." By Charles Humphrey Roberts. Chicago: A. C. McClurg & Co. 1891.

The House of the Wolf. By Stanley J. Weyman. Longmans, Green & Co.

The Blind Musician. By Vladimir Korolenko. Translated from the Russian by Aline Delano. Boston: Little, Brown & Co.

Youma. By Lafcadio Hearn. Harper & Brothers.

The Heriots. By Sir Henry Stewart Cunningham. Macmillan & Co.

"O Thou My Austria." Translated from the German of Ossip Schubin by Mrs. A. L. Wister. Philadelphia: J B. Lippincott Co.

Miss Eaton's Romance. By Richard Allen. Dodd, Mead & Co.

With the Best Intentions. By Marion Harland. Charles Scribner's Sons.

'JUGGERNAUT' is the grimly suggestive title of a political-social novel of New York and Washington life. There is very little by-play in its dramatic action, only enough to relieve the two intensely individual characters who move swiftly to the end. These characters present psychologic problems that are not satisfactorily solved in the dénouement. At least, there will be a difference of opinion as to the correctness of their solution. Given a young man with high aims that seek altruistic ends, of measureless ambition, but with a supreme belief in his power to achieve success, and it is difficult to conceive that he should suddenly commit moral suicide at the first temptation. To be sure, the temptation was a terrible one, and presented itself, as temptations have a way of doing, at a critical point in his career; but the scarcely perceptible struggle was soon over, and in the hours of meditation and retrospect that followed, there is no apparent desire to revoke his decision. And yet, years after, at the close of a career of political chicanery, dishonor is said to have been a hardly acquired thing with him, and "honesty and uprightness were innate." But, "with the woman, things were different." The character of the woman is more subtly conceived than that of the man, but a false note is struck towards the last that jars upon one's sense of harmony. A beautiful, impulsive girl, having no knowledge of his crime, marries this moral suicide. With absolute faith in and reverence for her husband, she blindly follows his lead, feeling a naïve delight in the unfolding of her powers. Her beauty, her wit, her naïveté are with fatal facility used as instruments for the furtherance of his political ends. Blinded by exceptional success, the husband gradually neglects his wife, and tries to stifle her craving for affection, coolly laying upon her the interdict of child-bearing, so intolerant is he of anything that may hinder the gratification of his insatiable ambition. From such a state of affairs a revolt on the part of the woman was inevitable; but the rapidity of her downward career, with its sordid accompaniments, comes as a shock of surprise to the reader, for neither her self-revelations nor the disclosing hand of the authors have prepared for such a radical change in her moral being. This, with the inscrutable attitude which she assumes towards her repentant husband, and maintains till her death, would presuppose an unbalance of reason itself; but we are forbidden this natural explanation by the apparent desire on the part of the authors to achieve a more striking dramatic effect.

The exhilaration produced by a sojourn on the romantic coast of Normandy may be communicated to others through the medium of speech or written sign; but its sparkling effervescence is apt to be quickly lost, and in a novel of three hundred pages, even though its ingredients are composed of sinister hypnotic experiments and thrilling escapes from a variety of dangers, unless there is good literary quality as a basis, the effect produced on the reader is far from exhilarating. The story of 'The Sardonyx Seal' might have been very interesting as an episode, but in its present form, and weakened by inverted sentences and needless French words and phrases, it soon palls upon the taste.

The story of 'Down the O-h-i-o' has a free movement and a racy flavor not unlike the old river song. The times of which it treats are the uneasy days of slavery, and the scene of its main action that borderland of Ohio so favorable to the successful working of the "underground railroad." A sketch of one of the stations on this road is very well done. The heroine, a little waif from Pittsburgh floating down the river in search of an aunt who lived in the "Ohio country," finds a home among the Quakers, in a primitive community; and as her blithe and vigorous nature develops, she presents an amusing contrast to the steady-go-

ing Friends, the worldly side of whose character is pithily expressed in the old saying, "Godward he was a very fine man; but manward he was just a leetle twistical." It is true that the vagaries of the human, not to say the feminine, mind are past understanding, but there is an unnecessary mystification in the fact that such a self-reliant, clear-seeing young woman as the heroine of this story should consent to an elopement with a stranger and a charlatan. Aside from this fault the plot is well constructed. The style is somewhat uneven, and at times awkward, but the story maintains a wholesome quality throughout.

'The House of the Wolf' purports to be an English version of a French autobiography written in 1620 by the Vicomte Caylus, who, as a youth of seventeen, chanced to spend in Paris a single night—that night the 24th of August, 1572, the awful one of the Massacre of St. Bartholomew. For historic pedigree one is referred to an incident of the massacre related by De Thou, who tells how on that evil night a certain man, falling into the power of his deadly foe, was led out of harm and dismissed to a place of safety through very shame of the occasion and through respect for a courageous enemy. This pretty episode is the foundation of the pretty romance before us. Three striplings ride to Paris to warn of danger the affianced husband of their kinswoman. Their adventures and the happy outcome of their journey are told in language touched with quaintness, and with an artistically hidden art that is graceful and attractive. The story makes a delicately pleasing contribution to that class of books which gilds for our gilded youth the pill of history.

'The Blind Musician' is a sketch called by its author "a psychological study," wherein he essays a description of the feelings of a person blind from birth. Mr. George Kennan's introduction bespeaks the reader's interest in the Russian author on literary grounds, and others as well. He is one of a group of young Russian writers whose careers have been interrupted by the heavy hand of Government. Although Korolenko is not specifically a political writer, his stories have held enough of "Young Russia" in their views to draw upon him repeated sentences of banishment and the censor's veto. The present sketch is further introduced by a letter from Mr. Anagnos of the Perkins Institute for the Blind. The story itself is less a story than a searching and touching analysis of the inner experiences of one who has never known sight. It spares no pang, but it also carries a hope in the tranquillity and usefulness attained by the hero. The brusque realism, the sharp outlines, of many Russian stories are not wanting here, but not all Russian stories have the tenderness or the artistic quality of this one. The style is poetic and somewhat mystical; the translation is smooth and sympathetic; the illustrations, though graceful, are superfluous in so slight a story, and the lustrous paper is well fitted to furnish new subjects for studies of the blind.

'Youma' is the story of a West Indian slave. The scene is laid in Martinique; the dénouement occurs in 1848, just before the news of the abolition of slavery reached the island, too late to save the beautiful Youma and her friends from a tragic doom. Mr. Hearn writes with an exquisite sensibility to the literary resources of his chosen theme. His fine feeling for nature, poetry, pathos, romance finds a happy field in the tropical life he draws with a pen from which truly "flows the color of the dawn." It is gratifying to find that his literary sense is fast overtaking his æsthetic sensitiveness. The rank luxuriance of style in his earlier 'Chita' has been pruned to a saner richness in 'Youma,' and gives hope of further progress in the same wise way.

The first chapters of novels make a class of literature by themselves. Like the curtain-lifter at the theatre, they often bear no relation to the main entertainment; but that is precisely the business of the curtain-lifter, whereas the opening pages of the novel may be supposed to be set in a certain key which indicates what is to follow. The seasoned reader of fiction will not be betrayed into judgment, much less hope, by the initial pages of his author. The unseasoned reader will think, upon beginning 'The Heriots,' that he has embarked upon a novel of the Norris type—a novel of construction. We are bound to say that he will not find this, equally bound to add that he will find what will very possibly please him better, a novel of clever sayings. More and more as the plot advances it is seen to be a somewhat perfunctory affair, which sits a little uneasily upon even the author. For example, he is at some pains to secure an invitation to a dinner-party for his leading lady, and forgets to have her present. The usual machinery of suppressed codicils, thwarted young love, mortgaged ancestral acres, is employed with the usual effectiveness. What is really unusual about the book, however, is the wit of the conversations. To these one recurs again and again after comfortably dismissing the story. So much of easy familiarity with letters, both classic and modern, does not often permeate the pages of a novel, and very seldom does the novel-reader find the ball of conversation kept tossing to and fro in such brilliant flights. That cynicism is pushed to a point almost disagreeable at times is quite true, and one reflects that perhaps the ingénue was just as well absent from the promised dinner. It is not, however, the unpleasant which makes the wit of the book. It appears here and there and is easily forgotten, while its cleverness leaves behind the sense of a shining hour.

Ossip Schubin's novel is readable, absolutely modern, the work of a note-taker rather than of a thinker. It is crowded with characters and with incidents. A species of modern show, this, which fills the pages: a sunny Sunday afternoon in a great city, when promenaders, old, young, gay, fair, disreputable, pass before the eye. One never feels the temptation to say, "Verweile doch, Du bist so schön!" but it is a sufficiently amusing pageant to while away an hour withal. The translation is made with great elegance and spirit.

'Miss Eaton's Romance' breathes the noblest motives. It is a tale of shipwreck occurring on the New Jersey coast in the presence of large numbers of the summer boarders. The shipwrecked, being conveyed to the boarding-house, become an incidental divertisement in the boarders' lives, and the book is devoted to the meals of the boarders in detail, and to the struggle to have each of the watchers by the shipwrecked get his breakfast, dinner, and tea regularly. When John has to go out, Burr goes in, and when both need a meal, the Doctor enters the sick-room; this is repeated through 300 pages. After the provisions are all exhausted, the author bethinks him to bring the old lovers together and to drown the villain, and the curtain descends to the breakfast bell's merry clang.

'With the Best Intentions' is a most preposterous book. No one would predict, on reading the rather clever character sketch in the first chapter, the depth of literary degradation that he is doomed to witness. A young wife on her wedding journey becomes jealous of an old friend of her husband's whom they meet by chance at their hotel on Mackinac Island. Aided by some unfortunate appearances of evil, and by a caricature of a mother, the bride builds up her jealousy into a great hotel investigation of the career of a woman before whose perfections and fascinations those of angels pale. The author's infatuation with this lady is equalled only by that of the young husband, two gushing women, and all the men dwellers in Mackinac, who fight (sometimes literally) under the standard of the maligned goddess. Although the goddess's mother dies under the hand of calumny, she herself spreads her white wings and flies to Newport, where lurks a hint of a compensatory marriage. The persecuting bride sinks into oblivion, scorned by her husband and all attachés of the opposing faction.

A specimen paragraph describes the singing of "Nearer, My God, to Thee" by the hotel guests, under the auspices, of course, of the principal contestants in the *cause célèbre*. It begins in the parlor; then "the voices of old men and maidens were blended in holy rapture; young men cast aside their cigars to add deeper tones; children in their beds, the colored waiters in the far dining-room, fishermen in their craft alongshore, one and all, took up tune and words." Has the World's Fair Committee read this book? It certainly should find here a hint towards the colossal. The landscape and the historic associations of Mackinac Island are helped by quotations from Miss Woolson's 'Anne,' with whom we condole upon being made an accessory.

A LIFE OF DUPLEIX.

Dupleix. By Col. Malleson, C.S.I. [Rulers of India.] Oxford: Clarendon Press; New York: Macmillan. 1890.

THE career of Joseph Francis Dupleix is one of singular interest. He was a man of remarkable gifts, and gave abundant proof of them. But the only part of his work that was permanent was that by which his enemies profited. His own life was a lamentable failure; his efforts on behalf of France, which repaid him with such stupid ingratitude, serve only to constitute a striking instance of what some one has called "the might-have-beens" of history. He strove to create, and for a moment seemed to have created, a great French dominion in the East. Had he been better supported, India might have become French instead of English, and the history of two great states and an enormous territory have taken a wholly different turn.

Born in 1697, the son of the Farmer-General and Director-General of the French Company of the Indies, Dupleix entered the service of that company at Pondicherry, the headquarters of the French in southern India, eighty-six miles S. S. W. of Madras, in 1720. In 1730 he was appointed Intendant of Chandernagore, the settlement on the Hooghly, a few miles above Calcutta, which had been first occupied by the French in 1676, and which they still retain. Having shown his administrative capacity there by stimulating the trade of the place in an unexpected way, he was in 1741 transferred to Pondicherry, and named General Commandant of the French possessions in India.

In 1744 the War of the Austrian Succession, for which Frederick of Prussia was so largely responsible, broke out between France and England. Dupleix, who could count on little help

from home, tried to arrange with the English Governor of Madras for abstinence from hostilities in India. The English, however, refused, and were made to suffer for their imprudence, for Dupleix and La Bourdonnais, the French Admiral on the coast, forced Fort St. George, the English stronghold, which is now generally known as Madras, to surrender. Dupleix had promised the Nawab of the Carnatic that when once Madras was taken it should be delivered over to him. The non-fulfilment of this engagement led to an onslaught by the Nawab's troops upon the French; and the defeat of his forces by very small French detachments in two conflicts was the first revelation of the incomparable superiority of drilled European troops to native levies. Following up his advantage, Dupleix directed an attack on the one stronghold which remained to the English, Fort St. David, near Gudalar, some sixteen miles south of Pondicherry. But the officer to whom he intrusted this enterprise proved incapable, a second attempt was foiled by the sudden arrival of an English squadron, a third attempt, made after this squadron had withdrawn, was foiled by a vigorous sally of the British garrison; and then, so far from pressing his adversaries, Dupleix was himself beset in Pondicherry by a powerful British fleet. Though not a soldier himself, his energy so inspired the garrison that the repeated attacks of the fleet and the land forces were repulsed till, after a two months' siege, the British Admiral sailed away to escape the approaching monsoon.

Then came, in 1749, the peace of Aix-la-Chapelle, under which France bound herself to hand back Madras to England. The *status quo ante* was restored. But Dupleix had achieved two great things: he had inaugurated the policy of alliances between the European establishments on the coast, hitherto occupied only in commerce, and the native powers, nominally vassals of the great but fast-decaying Mogul Empire; and he had proved that European troops, properly led, were able to overcome immensely more numerous native armies. He had disclosed the same secret which the Athenians disclosed at Marathon, but which was not fully appreciated till the return of the Ten Thousand from the expedition of the younger Cyrus had written it in bold characters, that the undrilled and ill-led multitudes of an Asiatic host are mere chaff in the balance against a small force of disciplined civilized soldiers. This secret fascinated him. A vista of conquest and glory for France and for himself opened before his eyes. A question of disputed succession which had arisen upon the death of the Subahdar of the Deccan gave him an opportunity of pushing his schemes. He espoused the cause of one of the claimants, and supported him not only with a small French detachment, but with a considerable force of sipahis (or, as we call them, sepoys), native troops whom he had drilled in European fashion. As his reward, he received from his successful protégé large territories and the promise of still further gains.

However, the English had now been roused, and though there was peace between England and France at home, that seemed no reason why they should not espouse the cause of an adverse claimant and extend their influence and opportunities for trade by giving him military aid. But they proved no match for the skilful combinations of Dupleix, who, partly by the vigorous action of his generals, partly by his astute diplomacy, established in two years the virtual supremacy of French influence over the greater part of Southern India. A large cession of territory was granted by the new Subahdar of the Deccan to the French, and the title of Nawab of the Carnatic offered to Dupleix, who, however, prudently declined it. He was fond not only of the reality but of the display of power, but he perceived that he would not be substantially the stronger for this Oriental honor, and he may well have felt that it might excite suspicion and jealousy in France.

Only one thing was needed to the triumph of France, the submission or capture of the adverse native pretender to the Nawabship of the Carnatic, whom the English had supported. He had fled to Trichinopoli, and from that almost impregnable fortress was imploring the help of the English. Hitherto their somewhat half-hearted efforts had been unsuccessful. But the extraordinary success of Dupleix seems to have at length roused them, and they sent a small force to help to defend Trichinopoli against the much stronger native and French army which was attacking it. No one who has seen can ever forget the Rock of Trichinopoli. It is one of those huge, isolated, craggy masses of granite which rise here and there from the plains of southeastern India, its top accessible only by a long staircase, most of which is cut out of the solid rock, and crowned by a Hindu temple. It soon became the centre of a series of memorable campaigns, in which the French failed to capture the fortress, while the English, unsuccessful at first, began to add victory to victory as soon as they had found two really capable men to lead their troops, Stringer Lawrence and Clive. Dupleix did all that energy and resourceful courage could do to raise forces to stimulate his native allies to frame plans for the conduct of military operations. But, unluckily for himself, he had, or thought he had, no gift for leading armies in the field, and his plans were constantly wrecked by the incompetence or sluggishness of his generals. When the struggle, which had virtually become a war between France and England for the control of Southern India, had lasted more than three years, the French Company of the Indies, who found hostilities costly, and saw no corresponding return in revenue, became impatient. They had for some time wished Dupleix to settle things any how with the English, and had been roused still further by communications from the English East India Company, who assured them that their restless and ambitious Governor was the only obstacle to peace. Thinking that, as the Latin maxim says, they might properly take advice even from an enemy, they at last resolved to recall him.

In 1754 a certain Godehen was sent out to arrange peace with the British of Madras and to supersede Dupleix. There seems to have been no intention to humiliate the latter needlessly, nor was he ill received on his return to France. But Godehen managed to investigate and deal with the complicated accounts between Dupleix and the French Company in such wise as to deprive the latter of nearly the whole of the large sums which he had gathered, for the far larger part of these sums had been advanced by him to the Company for current expenses, or had been lent on the Company's behalf to native princes; and of all this Dupleix could obtain no part from his successor. Nor had he any better fortune in France. The authorities of the company put him off; the Ministers of Louis XV. neglected him, and, after ten years of continued disappointments, sinking deeper and deeper into indigence as his creditors pressed him more severely, he died, in poverty and wretchedness, in 1764, being then sixty-seven years of age. Seldom has a great man been treated with more callous ingratitude, for it does not appear that any misconduct or misuse of his powers for selfish purposes was ever charged against him. Clive and Warren Hastings were by no means spotless; but in their cases great services were allowed to outweigh errors. England at her worst has been less unjust than the despotic monarchy in France; but it must also be remembered that Dupleix, though he had shown gifts equal to those of Clive and Hastings, did not, like them, return triumphant and wealthy.

That his gifts were of the highest order can hardly be disputed. Untiring energy, inexhaustible resource, great dexterity in devising schemes, great tact in carrying them out, were united to a remarkable power of inspiring respect and confidence in those he dealt with. His failure may be ascribed to three causes. One was the want of personal military capacity, which obliged him to intrust the fulfilment of his plans to the hands of others. Clive could strike as well as scheme. A second was his apparent deficiency in the power of choosing the best officers. Several times, no doubt, he made happy selections, but more frequently his commanders proved unequal to the emergencies they had to meet. And a third may be found in his omission to make secure his position at home. Carried away by the brilliant vista of conquest which he saw open in India, he seemed to have forgotten the absolute necessity of conciliating the authorities in France and keeping them in good humor by remittances of money. Yet, after all, he would probably have succeeded but for the accident that the pistol with which young Robert Clive had tried to shoot himself in 1745 missed fire, and left the founder of the British Empire in the East to destroy the armies which had begun to conquer an empire for the French.

Of Col. Malleson's book there is not much to be said. He is an experienced bookmaker and gives a readable narrative of the campaigns, though in a rather slipshod style. His reflections are trite and repeated with an iteration which occasionally becomes tedious. Hardly anything is done to bring out the personality of Dupleix and enable us to realize what manner of man he was in daily life. Nothing, for instance, is said about his love of display and ostentation, contrasting with the military simplicity which Clive practised in India, nor are we told anything about his personal appearance, nor whether portraits exist of him, nor where, when, and by whom his diary (once or twice quoted) was published. If a narrative of events takes the form of a biography, some personal account of the hero ought to form a part of it. Our curiosity regarding the ablest man that served France abroad between the death of Louis XIV. and the Revolution, is left unsatisfied by this book.

Canada and the Canadian Question. By Goldwin Smith, D.C.L. Macmillan & Co.

However decidedly the reader may dissent from Mr. Goldwin Smith's political opinions, he cannot fail to be interested in this carefully prepared statement of his views on Canada and the Canadian question. Besides being possessed of the rare gift of a beautiful style, Mr. Smith has lived long enough in Canada to have acquired perfect familiarity with its social and political features, and he is, therefore, peculiarly well equipped for his undertaking. It is true that the natural bias of his mind, which tends towards distrust of democracy, and has a yearning affection for British standards of fifty years ago, occasionally leads him

into what some of his readers will consider a misinterpretation of facts. But while these instances are of sufficient importance to call for comment, they do not seriously impair the soundness of his general argument or of his conclusions; and perhaps, in the discussion of such problems, the hard blows of the controversialist make for the best results as surely as the judicial calm of the philosophic historian.

Two-thirds of the book is devoted to a brief but admirably written account of the beginnings of Canada, of the French and British Provinces, of the union of the two provinces, and finally of the causes which led up to confederation. Here and there are evidences of the bias above referred to, as, for instance, when, in speaking of the defeat of the French by Wolfe, Mr. Smith says that England "should not be accused of blindness because she failed to foresee that the requital of this supreme effort on behalf of her American colonists would be their secession." Surely there is something grotesque in this allusion to the Revolutionary war as an unjust and ungenerous requital of past kindnesses! Again, Mr. Smith says that two generations have not sufficed to efface the evil memories of the war of 1812, and that "unprincipled American aggression" at that time counteracted or weakened any attraction that American institutions might have possessed for Canadians. But then, war must of necessity leave unpleasant memories, and is it true that all the aggression was on the side of the United States?

Nowadays the Irish question cannot be eliminated from the Canadian, or from any other English or colonial political question; and, Mr. Smith's views on the Irish question being of a very decided character, he loses no opportunity of expressing his dislike of the Irish people and of all who espouse their cause. He has a very poor opinion of Canadian politicians, and says of them that "unscrupulous craft and a thorough knowledge of the baser side of human nature have become their ideal of statesmanship." But he consigns to a still lower deep the British statesmen who "have leagued with the Clan-na-Gael and other enemies of their country for the subversion of the Union." Presumably this category includes Mr. Gladstone and all his followers; but their opponents do not fare much better at Mr. Smith's hands, for he declares that, in consequence of democratic change, the House of Commons, as a whole, is becoming "an anarchy and a bear-garden, incapable either of legislation or of government."

Again, in his account of the French Province and of the French population, Mr. Smith's anti-Catholic bias comes into play. He describes the ship of the Church, with the Jesuit at the helm, as "steering on a course opposed to progress and the organic principles of modern civilization." And yet, almost in the same breath, he warns British statesmen against free education, on the ground that the whole community is taxed for the benefit of a portion only, and that parental responsibility is extinguished. Fortunately, Mr. Goschen has succeeded in bringing even British Conservatives to the point of believing that free education is one of the "organic principles of modern civilization."

After disposing of the historical part of his subject, Mr. Smith proceeds to discuss the "Fruits of Confederation" and the "Canadian Question," the latter being defined as the question "whether the Provinces of the Dominion can for ever be kept by political agencies united among themselves and separate from their continent, of which geographically, economically, and, with the exception of Quebec, ethnographically, they are part." Mr. Smith's unfavorable view of the results of Canadian Confederation under the Act of 1867 is well known, and is here presented in vigorous and unmistakable language. Much of what he says, especially in regard to the low tone of political morality in the Dominion, is undoubtedly true; but here also, as in the earlier portion of the book, his case suffers somewhat from over-statement. For instance, he says that "political morality, and to some extent general morality with it, have been sacrificed to the exigencies of this artificial combination of provinces, and of an isolation of these provinces from their continent." But he entirely fails to show that political morality is now at a lower ebb than during the period before confederation; and if he believes that, after annexation has put an end to the "isolation of the provinces from their continent," the atmosphere of Washington will rehabilitate Canadian political morality, he is certainly extremely sanguine.

Perhaps the most important, and certainly the most obvious, result of Canadian confederation is the Canadian Pacific Railway. American travellers will remember to their cost what the Grand Trunk service was in the days before the competition of the new road revolutionized Canadian ideas of what a railroad should be. But Mr. Smith is opposed to the Canadian Pacific because it is the child of confederation; and he expresses the opinion, which not one Canadian in a hundred will share with him, that the Grand Trunk Road has done more for Canada than the Canadian Pacific. He claims that the latter road has "carried settlers far away from their markets and their centres of distribution, raised their freights, and, what is worst of all, deprived them of the advantages of close settlement." He takes no account of the new "markets and centres of distribution" which are springing up on the rich prairies west of Winnipeg; of the development, as yet in its infancy, of the immense mining resources of Sudbury and British Columbia; of the new commerce which is seeking the magnificent harbor of Vancouver. His indictment is almost identical with that which the English squires drew against railroads in the good old days before the Reform Bill, to which Mr. Smith looks back with peculiar fondness. Equally out of date is the quoted opinion of two English artillery officers who in 1866 prophesied that the Intercolonial Railway would be so often blocked by snow as to be useless for the transport of English troops to India. Any military man acquainted with the working of Canadian railroads in winter would certainly rather face the remote risk of such a blockade than the infinitely greater risk of a stoppage of the Suez Canal in the event of a Russian invasion of India.

As to the general results of Canadian confederation, there is of course room for much difference of opinion. Many believe with Mr. Smith that the prosperity of the Dominion would have been much greater than it is if free trade had been adopted instead of protection as the basis of the financial system. A small minority of Canadians may share his idea that the different provinces would have done better without confederation. But the recent elections show that there has been no marked change in Canadian public opinion on the subject of the tariff, and the still more recent adoption of the Canadian plan of confederation by the Australian colonies shows that colonial opinion is satisfied with its results. Mr. Smith is strongly in favor of some system of commercial reciprocity between this country and Canada, and he regards eventual annexation by this country as the manifest destiny of the Dominion. He considers that this would be the best solution of the question from the English point of view, because England, under the present tariff, has no longer any exclusive control over Canadian trade, and would be freed from many causes of diplomatic disputes if she withdrew politically from the American Continent. But though there is much to be said in favor of these views, it is quite certain that at present, both in Canada and in England, they are favorably entertained by a small minority only. The French population of Canada is especially loyal to the English connection. It has been said by an eminent French Canadian that the last gun in defence of British dominion on this Continent would be fired by a Frenchman, and there is no doubt that the French feel that by annexation to the United States they would lose the disproportionately large share of political power which they now possess. Desirable as it is that the present anomalous condition of trade relations between the two countries should be changed, and that the change should take the general direction indicated by Mr. Smith, there seems to be no immediate prospect that his ideas will be realized. Nevertheless, he is entitled to our gratitude for the fearless manner in which he has stated his views, many of which will not tend to the increase of his popularity in Canada; and, in spite of the defects to which we have referred, his book is a noteworthy contribution to the literature of the subject.

Later Leaves. Being the Further Reminiscences of Montagu Williams, Q.C. Boston: Houghton, Mifflin & Co. 1891.

MR. WILLIAMS would have done well to resist the solicitations of his friends to continue the recital of his experiences at the bar. What he has here given his readers is but the lees, and the recollection of his former volumes will be too fresh for them not to be sensible of the falling off in quality. The fault is not in the style, for that retains its vivacity, but it is evident that the writer had told the best of his stories. We find almost nothing to which it seems worth while to call attention as especially entertaining, except one anecdote of Justice Maule—concerning whom all anecdotes are welcome. A person coming before him for trial, charged with an aggravated offence, brought forward a number of witnesses to his good reputation, and the Judge was asked to refer in his charge to this evidence. He complied in the following terms: "Gentlemen, I am requested to draw your attention to the prisoner's character, which has been spoken to by gentlemen, I doubt not of the greatest respectability and veracity. If you believe them, and also the witnesses for the prosecution, it appears to me that they have established what to many persons may seem incredible, namely, that even a man of piety and virtue, occupying the position of Bible reader and Sunday-school teacher, may be guilty of committing a heinous and grossly immoral crime."

We are very glad that Mr. Williams has preserved the admirable remarks of Lord Bramwell made at the trial of some trade-union officers for intimidating men who did not belong to their union in their search for work. They are a combination of pathos and good sense such as is rarely found. We mar them by quoting only a portion, but we cannot resist the opportunity of repeating the following sentences:

"Now I put it to your own judgment to reflect what right you have to call on any man to throw his labor into a common stock with your own because he happens to be in the same trade. You have no more right to call upon him to do that than you have to call upon him to throw what property he has into a common stock. Depend upon it, it is wrong. If any reason can be given for it, it must come from those who assert it, not from those who deny it. But you must be wrong in thinking it a desirable state of things. If all the journeymen tailors ought to combine together, so ought all the shoemakers and hatters and agricultural laborers, and, in fact, every class and description; and so ought, by a parity of reasoning, all masters and all other persons who have got some common bond of union among them. And what would be the consequence of that? Would it be for the benefit of society at large? You cannot think so. The only way it would be for the benefit of society at large would be if the object of the common desire of what is called wealth were thereby increased by such an arrangement as that. But would wealth be increased? Certainly not; because everybody knows that the total aggregate happiness of mankind is increased by every man being left to the unbiassed, unfettered determination of his own will and judgment as to how he will employ his industry and other means of getting on in the world. You must know it."

During recent years Mr. Williams has sat as a magistrate at the police courts in East London, and has been very deeply impressed with the horrors of human life in those districts. His accounts of what he has seen and heard are graphic enough, and the sentiments he expresses do credit to his humanity; but he has little to offer towards the solution of the problem, except a proposal that Government should remove some of the manufactories without the city. It is very suggestive of the difficulty of the situation to learn that Mr. Williams is informed that "the roads to London are choked with destitute and semi-destitute persons hurrying thither to participate in the funds which they anticipate will shortly be forthcoming" under Gen. Booth's scheme. But as to Mr. Williams's suggestion, we apprehend that the language of Tacitus might be applicable—*Solitudinem facit, pacem appellat.*

Frederick Douglass: The Colored Orator. By Frederic May Holland. Funk & Wagnalls.

THIS biography is markedly superior to that of Wendell Phillips by the editor of the series of "American Reformers," to which it belongs. Its cultivated style and its evidence of laborious research among the sources especially distinguish it. Nor is Mr. Holland a thick-and-thin eulogist, though he constantly talks of "our hero" and "our black knight." Still, it may be doubted whether the work was called for, seeing that Mr. Douglass is yet alive, and that there have been three editions of his autobiography, of which the latest appeared in 1882. Mr. Douglass has, of course, been politically prominent since that date, and there was something to relate concerning him as Marshal of the District of Columbia and as Minister to Hayti—two offices filled by him with a truly poetic justice. His letter in praise of Mr. Cleveland, after the latter had removed him, in 1886, from the office of Recorder of Deeds for the District, is highly creditable to both parties.

Mr. Holland's candor is not left to be inferred. He is evidently out of sympathy with Mr. Douglass's political views since the war—by which we mean since 1877; as respects the tariff, for example, or force bills, or Mr. Douglass's opposition to "one of the best nominations made that year [1888] by either party for Congress, that of Col. T. W. Higginson." On the other hand, he undertakes to defend Mr. Douglass's ante-bellum political career, which involves putting in the wrong his old associates, the disunion abolitionists. In this vindication Mr. Holland is biassed by his misconception of the anti-slavery disunion policy, which was primarily a discharge of conscience from all complicity with slavery, and only secondarily a means to the abolition of slavery. The disingenuousness, too, and historical falsification by which the political abolitionists sought to evade the logic of the Garrisonian postulates, are Mr. Holland's by adoption, but have become simple naïveté, as one may see from his calling the Garrisonian view of the pro-slavery elements of the United States Constitution the "Southern view."

Mr. Douglass's breach with the abolitionists grew out of his starting a newspaper against their friendly dissuasion. Mr. Holland shows that their apprehensions were completely justified — that there were already in the field too many meagrely supported anti-slavery journals; that Mr. Douglass could not avoid financial shipwreck, however much patronage he might draw from the other journals; that he would be tempted, under these circumstances, to abandon his disunion views in order to find support among hostile political and sectarian abolitionists. All this, in fact, came to pass, but Mr. Holland imputes blame to the prophets, while giving a very inadequate idea of Mr. Douglass's animus towards those to whom he owed everything but his native talent for oratory, and no idea at all of his adroit employment of the *odium theologicum* against them. Selfishly considered, his journalistic step was advantageous in giving him a more settled life than that of an itinerant lecturer; but he could not possibly shine as a writer as he did on the platform, and one is left free to judge that his usefulness to the cause was very greatly diminished.

His political change, once made, was full of the inconsistencies issuing from the absurd premise that the Constitution of 1787 was an anti-slavery instrument. The Buffalo Convention of 1848, which Douglass attended, took the Garrisonian and "Southern" ground that slavery in the States was unassailable through the Constitution; but, unlike the Garrisonians, the nascent Free-Soil party had no intention of attacking slavery where it existed already, or might exist if new slave States should after all be created. Mr. Douglass, an ex-slave, eager to attack and overthrow slavery, pronounced this standard "low" (p. 201). The Free-Soil Convention at Pittsburgh in 1852 did not raise the standard in the least. Its whole policy was for circumscribing slavery, while Douglass (like the disunion abolitionists) was for extermination (p. 211). Nevertheless, he took the stump for John P. Hale, who was avowedly ready to give effect to all the pro-slavery clauses of the Constitution. In 1855 Douglass reproached the abolitionists to their face with holding disunion views which, "if carried to a successful issue, would only place the people of the North in the same relation to slavery which they now bear to the slavery of Cuba or Brazil"; yet Hale's election on the Buffalo-Pittsburgh platform would have left the North much worse off, since she would have held herself bound not only to let slavery alone in its own domain, but to return fugitives, to put down slave insurrections, and to give to slaveholders a disproportionate representation in Congress. In the case of Cuba or Brazil, none of these obligations existed. Mr. Douglass partly saw this himself when the Republican party was organized (p. 249):

"The objection to this movement," he said, "is the same as that against the American Anti-Slavery Society: it leaves the slave in his fetters, in the undisturbed possession of his master, and does not grapple with the question of emancipation in the States."

Of course it did not, since it held the historical, Garrisonian, and "Southern" view of the nature of the Constitution. Nevertheless, Mr. Douglass took the stump for Frémont. In 1860 he was still more disgusted with his political allies (p. 249): "The National Conventions held successively in Pittsburgh, Philadelphia, and Chicago have formed a regular descent from the better utterances [alias "low standard"] of 1848 at Buffalo." Nevertheless, after supporting a forlorn attempt to make Gerrit Smith a candidate for the Presidency, he took the stump for Lincoln, "with firmer faith and more ardent hopes than ever before"—but not in politicians.

Meantime he bore explicit testimony to the worth of the abolitionists whom he had bitterly denounced. In 1860 he wrote to the *Liberator* concerning the American Anti-Slavery Society (p. 279): "So far from working for the annihilation of that society, I never failed, even in the worst times of my controversy with it, to recognize that organization as the most efficient generator of anti-slavery sentiment in the country." In 1865 he supported Mr. Phillips in the division over the continuance of the society, when Mr. Garrison withdrew (p. 313). And only last September he said in Boston (p. 391): "It was they [Garrison and Phillips] who made Abraham Lincoln and the Republican party possible. What abolished slavery was the moral sentiment which had been created, not by the pulpit, but by the Garrisonian platform."

This review certainly greatly damages the pretensions of the political anti-slavery parties from 1848 to 1860 as respects their part, intentional or accidental, in the abolition of slavery. It also raises some questions as to the worldly wisdom and morality of a black man's joining them and abandoning the abolitionists; and perhaps, on reflection, will appear not to bear out Mr. Holland's censure of the latter in their treatment of Mr. Douglass.

The Septonate and the Centralization of the Tonal System. By Julius Klauser. Milwaukee: W. Rohlfing & Sons. Pp. 274.

THERE is at present a great spirit of unrest and dissatisfaction in the musical world in theoretic and technical matters. Although great progress has been made in the simplification of the means of writing and interpreting music, as well as in the theory of harmony, it is yet felt that much more remains to be done before the art of musical construction and instruction will have been reduced to its simplest terms. The Janko keyboard is now in the field, promising to halve the difficulties of playing the piano and to double the pianist's powers of execution; while among the theorists a conviction seems to be getting more and more settled that what might be called the anatomical analysis of music calls for analogous simplification.

Mr. Klauser's book is an attempt to show that the reason why the building is unsatisfactory is because its very foundations are unscientifically laid. Instead of the old scale system, which has the tonic at the base, he takes as the basis of music a septonate consisting of two scale-halves with a single tonic as a common centre; or, in other words, he holds that the septonate, and not the scale, presents the seven principal sounds in music in their fundamental position. "The septonate," he contends, "clears up and solves the leading

tone mystery, presents this tone in its primal relation and position, and furnishes solutions of many old and perplexing problems, especially of those melodic and harmonic problems which have arisen in the upper half of the scale, and which are brought forward in current theoretical works." He introduces many other iconoclastic notions—such as this, that inverted chords do not exist; and gives new and somewhat arbitrary meanings to old terms, as when he uses the word harmonics (which is now understood to mean the faint partial tones that accompany fundamental tones in music) to designate parts of chords.

The author's exposition of his system has not convinced us that the adoption of it would bring about the musical millennium, although it cannot be denied that it contains many valuable suggestions, some of which may gradually find their way to general acceptance. There are some sensible strictures (p. 62) on the habit of confounding time with measure, and on page 71 it is clearly and suggestively shown how accent determines harmony. The author is familiar with the speculations of Riemann, Marx, Hauptmann, Hey, Faure, Spencer; he is evidently a man who thinks for himself, and no one who is interested in musical theory can afford to overlook his treatise. But it is not for theorists alone, for there is an introductory essay of twenty-two pages on "A Higher Education in Music," the repeated perusal of which ought to be enjoined on every musician and music teacher in the country by special act of Congress. If the hints given in this chapter, and similar ones scattered throughout the book, were followed universally, musical intelligence and skill would take a miraculous bound forward in a few years. Read especially page 25, where the greatest defect in the present educational system is shown to lie in the fact that pupils are taught music by the eye instead of by the ear. "As it is, the average pianist sees a note, sees a key, strikes it, and, last of all, hears it. According to the above remedy the pianist first of all hears mentally what he wants, and then sets about producing it in a rational manner." Among several hundred pupils known to the author, "there was not one that had ever heard or thought of *thinking* tones and of mentally constructing phrases." He makes the sensible suggestion that it would be a good thing if pianists were compelled to study without an instrument for a few weeks at a time. Vocalists will find many useful hints, as on p. 136: "Let every vocal student be on his guard if he grows hoarse after practising. This is the unmistakable symptom of incorrect practice and usually of an incompetent teacher; if such practice is continued too long, it means the wrecking of what might have been a good voice; it means more, for in this way the foundation is laid for many throat diseases." His remark that "consonants are the muscle of the voice" is very felicitous. Read also the strictures on p. 117 on the faulty common way of studying harmony.

Perhaps the most novel and striking thing in Mr. Klauser's book is his contention (pp. 18-20) that "there is no such thing as an uncultivable ear for music, so long as there is no structural defect in the organ." He describes his treatment of a boy who heard no difference in pitch within the limits of two and one-half octaves, and, of course, could not tell a concord from a discord. By an ingenious but simple method, fully described by the author, he taught this boy in four months to discriminate the intervals of the scale, to sing little melodies, etc. "I do not doubt," he adds, "that by similar methods Goethe, who could not tune his instrument, and Charles Lamb, who tried in vain to sing two measures of 'God save the King' in tune, could have developed an acute sense of tone and pitch." Here is hope for the unmusical legions!

Year Book of the Societies Composed of Descendants of the Men of the Revolution. By Henry Hall. New York: The Republic Press.

Mr. Hall has compiled, in a beautifully printed book of nearly four hundred pages, the organization of the affiliated Societies of the Sons of the American Revolution in twenty-six of the States, with the statistics also of the National Society of the same name, and those of the similar associations in New York and elsewhere known as the Sons of the Revolution.

It appears that California took the lead in such organizations, having founded its society on the 4th of July of the centennial year, 1876. The different bodies under similar names are, according to Mr. Hall's statements, divided into two very unequal camps by the unwillingness of the New York Society of the Sons of the Revolution to be merged in the larger organization. The editor points to the fact that the Society of the Cincinnati has dwindled to a small and purely social body, exerting no appreciable influence upon the times even in the way of stimulating patriotism. He thinks this is due partly to its exclusiveness, since it was made up of officers in the Revolutionary Army and their lineal representatives by strict primogeniture, but partly also to its provincial and social character.

The lines of these later societies are, t must be confessed, rather vague. They receive descendants on either the paternal or maternal side from any soldier or sailor of the Revolution, or from "officials" in the service of the original States or colonies or of the United States, or from "recognized patriots" of the Revolution. They aim at keeping alive the patriotic spirit of the fathers, to collect and secure historical documents, and to promote social intercourse among their members. The proceedings of the State societies give evidence that political action and influence is also aimed at, with more or less distinctness of purpose.

A constituency so wide as these societies base themselves upon would, if all entitled to join were enrolled, embrace the whole American element of the people—meaning thereby the descendants, in both male and female lines, of the whole and of the half-blood, of the population of the country in 1783. The show of limitation or exclusion within these lines would prove illusive, if any general disposition in the eligibles to become members of the societies should be stimulated. Is it not pretty plain, then, that the real cause for the creation of such societies must be the old-fashioned "native-Americanism" that has its periodical revivals about as often as new generations come into the field of action? Is native-Americanism a force, politically or socially, upon which any one can reckon for active and persistent work? If it were, the directer and probably more successful way to organize would be upon an avowed political purpose. This, of course, means the recognition of the fact that the organization must remain a minority party, content to exert its influence as a balance of power, just as the Irish vote, or the German vote, is supposed to be used in that way, openly or covertly. Experiments in the past seem to prove that native-Americanism cannot be made a rallying point in any such way. A revision of the immigrant laws and the naturalization laws would be the extent of any probable activity in legislative or political directions, and such revision is as likely to be aided by the first generation descended from immigrants as by the third or the tenth.

For political purposes, then, the new societies are not likely to be strong, and whenever their members become inoculated with political ambition, they will begin to disclaim their Americanism as sedulously as typical politicians have disclaimed their honorary membership in the Cobden Club. For social purposes it may at least be queried whether the narrower lines of the Cincinnati are not more attractive; for what are social clubs if not exclusive?

Walter of Henley's Husbandry, together with an anonymous Husbandry, Seneschaucie, and Robert Grosseteste's Rules. The transcripts, translations, and glossary by Elizabeth Lamond. With an introduction by W. Cunningham. [Published for the Royal Historical Society.] Longmans. 1890. 8vo, pp. xliv, 171.

These four French treatises, which apparently date from the thirteenth century, all deal with the management of feudal estates. They contain practical instructions designed to assist in the conduct of ordinary affairs, especially the management of a large farm and a great household.

The most important of these treatises is Walter of Henley's 'Husbandry,' which teaches the lord of an estate how to husband his resources in managing the demesne or home farm, so as to derive most profit from the soil and avoid falling into poverty. The instructions are given in the form of advice by an old man to his son, who is informed how to spend his wealth, how to make an "extent" or survey of his lands and tenements, how to select and supervise servants, how to keep cattle, how to sow and manure the lands, how to sell the produce, etc. In short, every branch of rural economy is described. Concerning Walter of Henley, almost nothing is known. One manuscript states that he was a "knight who afterwards became a Dominican Friar." His book was long regarded as the best work on tillage. Hence many manuscripts of the tract still exist, and Mr. Cunningham gives a full account of them. It continued to be very popular until superseded by Anthony Fitzherbert's 'Husbandry,' which was published in 1523.

The second treatise in the volume before us is also entitled 'Husbandry,' the author being unknown. It deals primarily with the finances or accounts of a manor. It shows how the bailiff's accounts are to be kept, and how the lord can check them. It also enumerates the expenses and profits of an estate. The third treatise, the 'Seneschaucie,' describes the duties of the seneschal, bailiff, reeve, hayward, lord, auditor, ploughman, wagoner, cowherd, swineherd, shepherd, and dairymaid. The fourth treatise, 'Saint Robert's Rules,' is attributed to Robert Grosseteste, the well-known Bishop of Lincoln. It contains twenty-eight practical rules or maxims written for Margaret, Countess of Lincoln, about 1240, to guide her in the management of her estate and household. Most of the rules relate to the domestic economy of a great feudal household in the Middle Ages. Directions are given regarding the supervision of officers and servants, the care of guests, how to provide food for the table, how to sell grain, at what fairs to make purchases, how meals were to be served, how the servants should behave in presence of guests, etc.

The four treatises collectively form an important contribution to our knowledge of the inner life of a mediæval manor. The work of editing them has been admirably done, many manuscripts having been collated. There is also a good translation of the French texts, and an excellent Glossary, which the compilers of the forthcoming Anglo-French Dictionary of the Selden Society will find useful. This Glossary, however, is cumbered with a large number of words—such as avantage, bouche, bref, cas, office, possession—that are used in their ordinary modern sense. The following additions or changes seem to be advisable: certeyn = a sum certain, a fixed amount; chapitre = article or head; dener = money; poyn = regulation or rule; provost (præpositus) = reeve. Mr. Cunningham errs in stating that "few prose specimens of Anglicized Norman French survive outside of the Statute Book" (p. xix). There are numerous specimens in Littleton's 'Tenures,' the Year Books, the Rolls of Parliament, and other public records; likewise, in local muniments, such as the Liber Albus of London, the Domboc of Ipswich, the records of Winchester, Leicester, Southampton, and many other towns. But these slight flaws are scarcely worth mentioning in view of the very scholarly manner in which both Mr. Cunningham and Miss Lamond have done their work.

Dust and its Dangers. By T. Mitchell Prudden, M.D. New York: G. P. Putnam's Sons. 1890.

THIS little book may be regarded as complementary to the 'Story of the Bacteria,' which we noticed some months ago. That explained in popular language what those micro-organisms are; this shows how they are liable to do harm, especially to mankind, when dried and floating in the air—for the dangers here discussed are almost exclusively those of bacterial origin. Exaggeration is a common fault in popular books treating of scientific subjects, but this is quite free from it. Nothing is overstated, and in fact the average citizen who, in these latter days, may look upon all the food we eat and air we breathe as veritable traps baited with death, will rest easier when he learns how few of the little organisms are caught out of doors. But fewness does not mean immunity. It is as bad to be slain with the single bullet of an assassin as to be peppered with many in battle; and forewarning is, in part at least, fore-arming.

The danger upon which special stress is laid is that of infection by the tubercle bacillus, the consumption cause. We believe physicians are gradually abandoning the constitutional theory of consumption, in so far as that involves the doctrine of heredity with the "seeds" of disease necessarily implanted from the beginning, and are looking upon those individuals or families who become consumptive as having a better prepared culture-ground for such stray germs as may fall thereon. The effect is nearly but not quite the same; for if the seeds are kept out of the hot-bed, the death-plant will not blow, and if the most stubbornly healthy person is showered with enough of these micro-organisms, some will make a settlement. It is thus that consumption is contagious. The moral is to kill or avoid the germs, and to this Dr. Prudden's book leads up, and it deserves careful consideration at the hands of all of us. In his desire to be simple, the author, we think, has written down a little too much; but that is merely a question of taste. It would have been better, also, had the exact degree to which the microscopical objects are magnified been stated. "Highly" is not sufficiently definite, and a scale would add nothing to the trouble or the cost.

Teuffel's History of Roman Literature. Revised and enlarged by L. Schwabe. Translated from the fifth German edition by G. C. W. Warr. Vol. I. London: G. Bell & Sons. 1891.

SCHWABE'S second revision of Teuffel's well-known work is published in two volumes. The first volume, to the end of the Augustan age, has been translated by Prof. Warr of King's College, London, and the second is in preparation. The original work is well recognized as an indispensable handbook, and its characteristics are preserved in this revision. Of course, there is much new material in each succeeding publication (the present is a third as large again as the first), and Dr. Schwabe does not hesitate to differ here and there from the views of Teuffel, whenever his own judgment or the results of late research warrant such departures.

Prof. Warr has made his translation more valuable by additions, in the lists of editions and treatises, of many useful English books which have been loftily overlooked by the German editor. His translation is in the main a most faithful one, in the plain, straightforward manner of the original, and English readers will be very grateful to him for undertaking the task and carrying it through so promptly. His style, however, is greatly marred by a too close adherence to the German, chiefly marked by his employment of compounds, awkward in English and directly due to German influence. For instance, he talks of "art-poetry" (*Kunstpoesie*); yet he rightly renders *Kunstdrama* by "the regular drama." Among other harsh words is "well-to-doness" (*Wohlstand*). There is a perfect apotheosis of the hyphen in this book, but it is all in the same line of imitation of the German. Another offensive Germanism is the printing of Latin proper adjectives with a small initial letter, as *parthicum*. But all these are errors of taste, which do not diminish the usefulness of the book. We have observed only a few real blunders in translation. On page 99, "combated" is exactly the reverse of the meaning of *verfochten*, which here means "supported." On page 20, "subsisted" is not a proper translation of *erhielten sich*.

The book is well printed in two sizes of clear type, and even with its additions contains some seventy pages less than the German. The binding, however, is exceedingly flimsy and altogether too cheap for a handbook. Yet this first volume costs 18 shillings, while the price of the whole work in Germany, in a good strong half-morocco cover, is a trifle less.

Lessons in Astronomy. By C. A. Young. Boston: Ginn & Co. 1891.

THIS is a brief introductory course, without mathematics, for use in schools and seminaries. It might very well follow the home reading of Ball's 'Starland,' which is still more elementary, and precede Young's 'Elements of Astronomy.' It presents a chapter of definitions, a considerable account of the constellations, and the fundamental problems of latitude, time, and longitude in their most elementary form; then the earth, moon, sun, planets, comets, meteors, and stars. It is always a satisfaction to meet such a text-book as this, the work of an author who has not had to "read up" in its preparation. There need be no search to see if the statements are correct, for Prof. Young is an authority in his science; nor to learn if their presentation is in form well adapted for school use, for he is the most eminent teacher of astronomy in our country. To such an author a reviewer always feels thankful.

The chapter on the stars contains much of interest concerning variables, showing how clearly the changes in the light of these exceptional bodies permits their classification into several groups, and gives some indication of their condition or arrangement, although their physical features are far beyond direct sight. The rational quality of the book may be inferred from this sample sentence: "It is a natural question whether some of the small companions that we see near large stars may not be the 'Jupiters' of their planetary systems. We can only say as to this that no telescope ever constructed could even come near to making visible a planet which bears to its primary any such relations of size, distance, and brightness as Jupiter bears to the sun." The freshness of the book may be inferred from the paragraph on spectroscopic binaries—that is, double stars too close to be separated by the telescopic eye, but known to be double by the periodic displacement of their spectroscopic lines. The first star of this class was discovered at the Harvard College Observatory only a little more than a year ago. Illustrations are plentiful and good, except that the figures of nebulæ lack delicacy; the one of the nebula in Orion, from the photograph by Roberts of London, hardly does justice to the wonderful original.

George Washington's Rules of Civility traced to their sources and restored by Moncure D. Conway. New York: United States Book Company. [1891.] Pp. 180.

IN the preface to this very neat little volume of nearly two hundred pages, reprinting 'George Washington's Rules of Civility,' Mr. Conway explains what the sources are, traces the probable method by which the Rules reached Washington, and embodies some reflections upon their influence in forming the young man's character. All this has a certain antiquarian interest, but it may be doubted if the labor thus expended upon "copy-book" material is justified by the result, seeing that the Rules were not George Washington's, any more than the geometrical and surveying problems in the same MSS. were his, and it would be quite as useful to trace these problems to their sources, so far as they may be regarded as formative influences. The Rules can never possess any of the interest that attaches to a plan of campaign, a summary of political correspondence, or even a scheme of farming Mt. Vernon, for something of the man's individuality and habits are shown in such records. Mr. Conway hints that political reasons have prevented these Rules from being better known; he remarks upon the absence of any religious precepts or references to women in them, while insisting upon Washington's "rather precocious admirations" for the girls in his school-days. This is "unimportant, if true," and rests entirely upon tradition. It was enough for Mr. Conway to have discovered the sources of these Rules, as was set forth in the *Nation*, No. 1301. We wish he had carried his researches one step further, and traced the so-called poems of Washington to their originals. These verses constitute one of the weightiest indictments against the good sense and judgment of the farmer, the soldier, the statesman, and the national hero.

Decorative Electricity. By Mrs. J. E. H. Gordon. With a chapter on Fire Risks by J. E. H. Gordon, B.A., M.Inst.C.E., Director and Consulting Engineer to the Metropolitan Electric Supply Company. Illustrated by Herbert Fell. London: Sampson Low; New York: Charles Scribner's Sons.

It gives one a shock of surprise to receive a book on the decorative treatment of anything so new as electric lights, and makes one consider how much there is to do to tame them into things of beauty. But when we look into Mrs. Gordon's book, we are tempted to ask, If so little as this has been done, why write a book about it? The obvious idea of collusion with manufacturers disappears as we read and see that the present volume is the work of an enthusiast. Its substance is of the slightest, and consists, not of study of principles and methods, but of recipes and small conceits, as in most books on household decoration; things which, used once, may please, but are not simple enough for repetition, and if applied broadcast become as tiresome as patent medicines. The most attractive part of the book is the chapter entitled "Some Personal Experiences," which sketches briefly and freshly the labors, disappointments, anxieties, and successes that wait on pioneers. The naïve story of Mr. Gordon's superseded electric lamp, of the inventor's magnanimous welcome of a contrivance that extinguished his own, and the quiet tear of the wife over an invention smothered in its cradle, moves the reader to admiring sympathy. Mr. Gordon's chapter on fire-risks is chiefly occupied with pooh-poohing other people's statements that there are risks. Of the designs with which the book is illustrated and the drawings in which they are presented, the less we say the better.

BOOKS OF THE WEEK.

Ammen, Rear-Admiral D. The Old Navy and the New. Philadelphia: J. B. Lippincott Co. $3.
Anvers, N. d'. The Life Story of Our Earth. 2d ed. Thomas Whittaker. 40 cents.
Anvers, N. d'. The Story of Early Man. 2d ed. Thomas Whittaker. 40 cents.
Arnaud, Col. C. A. de. The New Era in Russia. J. S. Ogilvie.
Barker's Facts and Figures for the Year 1891. Frederick Warne & Co. 50 cents.
Boissevain, G. M. The Monetary Question. Macmillan & Co. $1.
Brentano, Dr. Lujo. The Relation of Labor to the Law of To-day. G. P. Putnam's Sons.
Burton, W. K. Photographic Optics. The Scovill & Adams Co. $1.

HENRY HOLT & CO., New York

THE REVIEW OF REVIEWS.

The May number, for sale by all newsdealers of standing, contains noteworthy character sketches of

"Three Empire Builders,"

namely, Sir Henry Parkes, the federator of Australia; Sir John A. Macdonald, the Premier of Canada, and the Hon. Cecil J. Rhodes, Premier of Capetown and President of the British South African Company. The review of RECENT RUSSIAN LITERATURE is an especially valuable feature of the current number, and the summaries of leading articles in all the principal periodicals of the world, are as full as usual.

The American Edition of the Review is winning golden opinions.

Twenty Cents a number; $2.00 per annum.

Sample copies of the May number will be sent on receipt of 10 cents.

THE REVIEW OF REVIEWS,
Astor Place, New York.

Also high-class Water Colors. Visitors are always welcome to call and examine these pictures.

Dyspepsia

HORSFORD'S
ACID PHOSPHATE.

In dyspepsia the stomach fails to assimilate the food. The Acid Phosphate assists the weakened stomach, making the process of digestion natural and easy.

Dr. R. S. McCOMB, Philadelphia, says: "Used it in nervous dyspepsia, with success."

Dr. W. S. LEONARD, Hinsdale, N. H., says: "The best remedy for dyspepsia that has ever come under my notice."

Dr. T. H. ANDREWS, Jefferson Medical College, Philadelphia, says: "A wonderful remedy, which gave me most gratifying results in the worst forms of dyspepsia."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION: Be sure the word "Horsford's" is printed on the label. All others are spurious. Never sold in bulk.

THE AMERICAN CITIZEN. By CHARLES F. DOLE. Cloth, 336 pages. 90 cents.

This book contains such subjects as every boy or girl needs to know something about before leaving school. The intent of the book, however, is not merely to impart information, but to help pupils to think for themselves, that they may see the principles of good sense, justice, and friendliness on which the State rests, and especially to awaken in them a loyal moral purpose. The first part of the book shows how the essential elements of all government are worked out. Part II. furnishes the main facts about the conduct and methods of government in towns, cities, States, and nations. It also explains the causes and growth of parties. Part III. deals with the subjects of labor, wealth, and property. Part IV. treats of special social subjects, such as crime and punishments, the problem of intemperance, etc. The closing chapters aim to interest the pupil in the rights of nations towards each other.

Sample copy sent free to any teacher having a class of 12 or more, and desiring to see it with reference to use.

D. C. HEATH & CO., Publishers, Boston, New York, and Chicago.
